| LAST_SQL_ACTIVE_TIME | DATE          | Time when this cursor was last executed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SQL_EXEC_ID          | NUMBER        | If the open cursor is executing, then the SQL execution identifier for that execution (see V\$SQL_MONITOR)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CURSOR_TYPE          | VARCHAR2 (64) | Type of cursor: <ul style="list-style-type: none"> <li>• OPEN PL/SQL - Open PL/SQL cursors</li> <li>• OPEN - Other open cursors</li> <li>• SESSION CURSOR CACHED - Cursors cached in the generic session cursor cache</li> <li>• OPEN-RECURSIVE - Open recursive cursors</li> <li>• DICTIONARY LOOKUP CURSOR CACHED - Cursors cached in the dictionary lookup cursor cache</li> <li>• BUNDLE DICTIONARY LOOKUP CACHED - Cursors cached in the bundled dictionary lookup cursor cache</li> <li>• JAVA NAME TRANSLATION CURSOR CACHED - Cursors cached in the Java name translation cursor cache</li> <li>• REPLICATION TRIGGER CURSOR CACHED - Cursors cached in the replication trigger cursor cache</li> <li>• CONSTRAINTS CURSOR CACHED - Cursors cached in the constraints cursor cache</li> <li>• PL/SQL CURSOR CACHED - Cursors cached in the PL/SQL cursor cache</li> </ul> |
| CHILD_ADDRESS        | RAW (4   8)   | Address of the child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 9.106 V\$OPTIMIZER\_PROCESSING\_RATE

V\$OPTIMIZER\_PROCESSING\_RATE displays the processing rates used by the optimizer to compute degree of parallelism.

### Note:

You can manipulate these rates using these procedures for the DBMS\_STATS package:

- SET\_PROCESSING\_RATE
- DELETE\_PROCESSING\_RATE
- GATHER\_PROCESSING\_RATE

See *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS\_STATS package.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS           | RAW (4   8)   | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                                                                                                                     |
| OPERATION_NAME    | VARCHAR2 (64) | Name of the operation. The possible values are AGGR, ALL, CPU, CPU_ACCESS, CPU_AGGR, CPU_BYTES_PER_SEC, CPU_FILTER, CPU_GBY, CPU_HASH_JOIN, CPU_JOIN, CPU_NL_JOIN, CPU_RANDOM_ACCESS, CPU_ROWS_PER_SEC, CPU_SEQUENTIAL_ACCESS, CPU_SM_JOIN, CPU_SORT, HASH, IO, IO_ACCESS, IO_BYTES_PER_SEC, IO_RANDOM_ACCESS, IO_ROWS_PER_SEC, IO_SEQUENTIAL_ACCESS, MEMCMP, MEMCPY                                                                    |
| MANUAL_VALUE      | VARCHAR2 (10) | Value of the operation set manually by the user                                                                                                                                                                                                                                                                                                                                                                                         |
| CALIBRATION_VALUE | VARCHAR2 (10) | Value of the operation obtained from calibration (by running the GATHER_PROCESSING_RATE procedure)                                                                                                                                                                                                                                                                                                                                      |
| DEFAULT_VALUE     | VARCHAR2 (10) | Default value of the operation                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 9.107 V\$OPTION

V\$OPTION displays Oracle Database options and features.

Typically, although not always, options must be separately licensed, whereas features come with the product and are enabled based on the product that is running (for example, Enterprise Edition).

| Column    | Datatype      | Description                     |
|-----------|---------------|---------------------------------|
| PARAMETER | VARCHAR2 (64) | Name of the option (or feature) |

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VALUE  | VARCHAR2 (64) | Indicates whether the option (or feature) is installed ( <b>TRUE</b> ) or not ( <b>FALSE</b> )                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.108 V\$OSSTAT

V\$OSSTAT displays system utilization statistics from the operating system. One row is returned for each system statistic.

| Column     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STAT_NAME  | VARCHAR2 (64) | Name of the statistic (see <a href="#">Table 9-3</a> )                                                                                                                                                                                                                                                                                                                                                                                          |
| VALUE      | NUMBER        | Instantaneous statistic value                                                                                                                                                                                                                                                                                                                                                                                                                   |
| OSSTAT_ID  | NUMBER        | Statistic ID                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| COMMENTS   | VARCHAR2 (64) | Any additional operating system-specific clarifications for the statistic                                                                                                                                                                                                                                                                                                                                                                       |
| CUMULATIVE | VARCHAR2 (3)  | Indicates whether the statistic is cumulative (that is, accumulates over time) ( <b>YES</b> ) or not ( <b>NO</b> )                                                                                                                                                                                                                                                                                                                              |
| CON_ID     | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Table 9-3 V\$OSSTAT Statistics**

| Statistic Name | Description                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| NUM_CPUS       | Number of CPUs or processors available                                                                                      |
| IDLE_TIME      | Number of hundredths of a second that a processor has been idle, totalled over all processors                               |
| BUSY_TIME      | Number of hundredths of a second that a processor has been busy executing user or kernel code, totalled over all processors |

**Table 9-3 (Cont.) V\$OSSTAT Statistics**

| Statistic Name           | Description                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USER_TIME                | Number of hundredths of a second that a processor has been busy executing user code, totalled over all processors                                                                                                             |
| SYS_TIME                 | Number of hundredths of a second that a processor has been busy executing kernel code, totalled over all processors                                                                                                           |
| IOWAIT_TIME              | Number of hundredths of a second that a processor has been waiting for I/O to complete, totalled over all processors                                                                                                          |
| NICE_TIME                | Number of hundredths of a second that a processor has been busy executing low-priority user code, totalled over all processors                                                                                                |
| AVG_IDLE_TIME            | Number of hundredths of a second that a processor has been idle, averaged over all processors                                                                                                                                 |
| AVG_BUSY_TIME            | Number of hundredths of a second that a processor has been busy executing user or kernel code, averaged over all processors                                                                                                   |
| AVG_USER_TIME            | Number of hundredths of a second that a processor has been busy executing user code, averaged over all processors                                                                                                             |
| AVG_SYS_TIME             | Number of hundredths of a second that a processor has been busy executing kernel code, averaged over all processors                                                                                                           |
| AVG_IOWAIT_TIME          | Number of hundredths of a second that a processor has been waiting for I/O to complete, averaged over all processors                                                                                                          |
| AVG_NICE_TIME            | Number of hundredths of a second that a processor has been busy executing low-priority user code, averaged over all processors                                                                                                |
| OS_CPU_WAIT_TIME         | Total number of hundredths of a second that processes have been in a ready state, waiting to be selected by the operating system scheduler to run                                                                             |
| RSRC_MGR_CPU_WAIT_TIME   | Total number of hundredths of a second that Oracle processes have been in a ready state, waiting for CPU to be available for their consumer group in the currently active resource plan                                       |
| VM_IN_BYTES              | Total number of bytes of data that have been paged in due to virtual memory paging                                                                                                                                            |
| VM_OUT_BYTES             | Total number of bytes of data that have been paged out due to virtual memory paging                                                                                                                                           |
| PHYSICAL_MEMORY_BYTES    | Total number of bytes of physical memory                                                                                                                                                                                      |
| LOAD                     | Current number of processes that are either running or in the ready state, waiting to be selected by the operating-system scheduler to run. On many platforms, this statistic reflects the average load over the past minute. |
| NUM_CPU_CORES            | Number of CPU cores available (includes subcores of multicore CPUs as well as single-core CPUs)                                                                                                                               |
| NUM_CPU_SOCKETS          | Number of CPU sockets available (represents an absolute count of CPU chips on the system, regardless of multithreading or multi-core architectures)                                                                           |
| NUM_VCPUS                | Number of virtual CPUs available                                                                                                                                                                                              |
| NUM_LCPUS                | Number of logical CPUs available (includes hardware threads if hardware threading is turned on)                                                                                                                               |
| TCP_SEND_SIZE_MIN        | Minimum size of the TCP send buffer                                                                                                                                                                                           |
| TCP_SEND_SIZE_DEFAULT    | Default size of the TCP send buffer                                                                                                                                                                                           |
| TCP_SEND_SIZE_MAX        | Maximum size of the TCP send buffer                                                                                                                                                                                           |
| TCP_RECEIVE_SIZE_MIN     | Minimum size of the TCP receive buffer                                                                                                                                                                                        |
| TCP_RECEIVE_SIZE_DEFAULT | Default size of the TCP receive buffer                                                                                                                                                                                        |
| TCP_RECEIVE_SIZE_MAX     | Maximum size of the TCP receive buffer                                                                                                                                                                                        |

Table 9-3 (Cont.) V\$OSSTAT Statistics

| Statistic Name          | Description                               |
|-------------------------|-------------------------------------------|
| GLOBAL_SEND_SIZE_MAX    | Maximum size of the global send buffer    |
| GLOBAL_RECEIVE_SIZE_MAX | Maximum size of the global receive buffer |

**Note:**

The availability of all statistics except for `NUM_CPUS` and `RSRC_MGR_CPU_WAIT_TIME` is subject to the operating system platform on which the Oracle Database is running.

## 9.109 V\$PARALLEL\_DEGREE\_LIMIT\_MTH

`V$PARALLEL_DEGREE_LIMIT_MTH` displays all available parallel degree limit resource allocation methods.

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2 (40) | Name of the parallel degree limit resource allocation method                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.110 V\$PARAMETER

`V$PARAMETER` displays information about the initialization parameters that are currently in effect for the session. A new session inherits parameter values from the instance-wide values displayed by the `V$SYSTEM_PARAMETER` view.

| Column | Datatype        | Description                                                                                                                                                                                |
|--------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM    | NUMBER          | Parameter number                                                                                                                                                                           |
| NAME   | VARCHAR2 (80)   | Name of the parameter                                                                                                                                                                      |
| TYPE   | NUMBER          | Parameter type: <ul style="list-style-type: none"><li>1 - Boolean</li><li>2 - String</li><li>3 - Integer</li><li>4 - Parameter file</li><li>5 - Reserved</li><li>6 - Big integer</li></ul> |
| VALUE  | VARCHAR2 (4000) | Parameter value for the session (if modified within the session); otherwise, the instance-wide parameter value                                                                             |

| Column                | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY_VALUE         | VARCHAR2 (4000) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DEFAULT_VALUE         | VARCHAR2 (255)  | The default value for this parameter. This is the value of the parameter if a value is not explicitly specified for the parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ISDEFAULT             | VARCHAR2 (9)    | Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE).<br>The database sets the value of the ISDEFAULT column to TRUE for parameters that are not specified in the init.ora or server parameter file (SPFILE).                                                                                                                                                                                                                                                                                                                                                                                                 |
| ISSES_MODIFIABLE      | VARCHAR2 (5)    | Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ISSYS_MODIFIABLE      | VARCHAR2 (9)    | Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: <ul style="list-style-type: none"> <li>• IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately.</li> <li>• DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions.</li> <li>• FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.</li> </ul> |
| ISPDB_MODIFIABLE      | VARCHAR2 (5)    | Indicates whether the parameter can be modified inside a PDB (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ISINSTANCE_MODIFIABLE | VARCHAR2 (5)    | For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.                                                                                                                                                                                                                                                                                                                                                                |
| ISMODIFIED            | VARCHAR2 (10)   | Indicates whether the parameter has been modified after instance startup: <ul style="list-style-type: none"> <li>• MODIFIED - Parameter has been modified with ALTER SESSION</li> <li>• SYSTEM_MOD - Parameter has been modified with ALTER SYSTEM (which causes all the currently logged in sessions' values to be modified)</li> <li>• FALSE - Parameter has not been modified after instance startup</li> </ul>                                                                                                                                                                                                                                                                             |
| ISADJUSTED            | VARCHAR2 (5)    | Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ISDEPRECATED          | VARCHAR2 (5)    | Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ISBASIC               | VARCHAR2 (5)    | Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| HASH                  | NUMBER          | Hash value for the parameter name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

### Examples

The following query returns the default value for the `ALLOW_GLOBAL_DBLINKS` initialization parameter:

```
SQL> SELECT name, default_value FROM v$parameter
 2 WHERE name = 'allow_global_dblinks';
```

NAME

-----

DEFAULT\_VALUE

-----

allow\_global\_dblinks

FALSE

SQL>

The following query shows that the `ALLOW_GLOBAL_DBLINKS` initialization parameter is not modifiable in a PDB:

```
SQL> SELECT name, ispdb_modifiable FROM v$parameter
 2 WHERE name = 'allow_global_dblinks';
```

NAME

-----

ISPDB

-----

allow\_global\_dblinks

FALSE

SQL>

This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.112 V\$PARAMETER2

V\$PARAMETER2 displays information about the initialization parameters that are currently in effect for the session, with each list parameter value appearing as a row in the view. A new session inherits parameter values from the instance-wide values displayed in the V\$SYSTEM\_PARAMETER2 view.

Presenting the list parameter values in this format enables you to quickly determine the values for a list parameter. For example, if a parameter value is *a*, *b*, then the V\$PARAMETER view does not tell you if the parameter has two values (both *a* and *b*) or one value (*a*, *b*). V\$PARAMETER2 makes the distinction between the list parameter values clear.

| Column        | Datatype        | Description                                                                                                                                                                                |
|---------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM           | NUMBER          | Parameter number                                                                                                                                                                           |
| NAME          | VARCHAR2 (80)   | Name of the parameter                                                                                                                                                                      |
| TYPE          | NUMBER          | Parameter type: <ul style="list-style-type: none"><li>1 - Boolean</li><li>2 - String</li><li>3 - Integer</li><li>4 - Parameter file</li><li>5 - Reserved</li><li>6 - Big integer</li></ul> |
| VALUE         | VARCHAR2 (4000) | Parameter value for the session (if modified within the session); otherwise, the instance-wide parameter value                                                                             |
| DISPLAY_VALUE | VARCHAR2 (4000) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.    |
| ISDEFAULT     | VARCHAR2 (6)    | Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE)                                                      |

| Column                | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISSES_MODIFIABLE      | VARCHAR2 (5)   | Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ISSYS_MODIFIABLE      | VARCHAR2 (9)   | Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: <ul style="list-style-type: none"> <li>IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately.</li> <li>DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions.</li> <li>FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.</li> </ul> |
| ISPDB_MODIFIABLE      | VARCHAR2 (5)   | Indicates whether the parameter can be modified inside a PDB (TRUE) or not (FALSE).<br>In a non-CDB, the value of this column is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ISINSTANCE_MODIFIABLE | VARCHAR2 (5)   | For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.                                                                                                                                                                                                                                                                                                                                                          |
| ISMODIFIED            | VARCHAR2 (10)  | Indicates whether the parameter has been modified after instance startup: <ul style="list-style-type: none"> <li>MODIFIED - Parameter has been modified with ALTER SESSION</li> <li>SYSTEM_MOD - Parameter has been modified with ALTER SYSTEM (which causes all the currently logged in sessions' values to be modified)</li> <li>FALSE - Parameter has not been modified after instance startup</li> </ul>                                                                                                                                                                                                                                                                             |
| ISADJUSTED            | VARCHAR2 (5)   | Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ISDEPRECATED          | VARCHAR2 (5)   | Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ISBASIC               | VARCHAR2 (5)   | Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DESCRIPTION           | VARCHAR2 (255) | Description of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ORDINAL               | NUMBER         | Position (ordinal number) of the parameter value. Useful only for parameters whose values are lists of strings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| UPDATE_COMMENT        | VARCHAR2 (255) | Comments associated with the most recent update                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID                | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                        |

## 9.113 V\$PASSWORDFILE\_INFO

V\$PASSWORDFILE\_INFO provides information about the database password file.

This view can be queried from the root or from a pluggable database (PDB) in a multitenant container database (CDB). When queried, this view always returns one row.

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                   |
|-----------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_NAME | VARCHAR2 (513) | Fully qualified password file name/location.                                                                                                                                                                                                                                                  |
| FORMAT    | VARCHAR2 (6)   | Shows the format of the password file: <ul style="list-style-type: none"><li>• LEGACY</li><li>• 12</li><li>• 12.2</li></ul>                                                                                                                                                                   |
| IS_ASM    | VARCHAR2 (5)   | Indicates whether the password file is stored in Oracle ASM. Possible values: <ul style="list-style-type: none"><li>• TRUE: The password file is stored in Oracle ASM.</li><li>• FALSE: The password file is stored in Oracle Exascale or in the operating system file system.</li></ul>      |
| IS_EXC    | VARCHAR2 (5)   | Indicates whether the password file is stored in Oracle Exascale. Possible values: <ul style="list-style-type: none"><li>• TRUE: The password file is stored in Oracle Exascale.</li><li>• FALSE: The password file is stored in Oracle ASM or in the operating system file system.</li></ul> |
| CON_ID    | NUMBER         | The ID of the container to which the data pertains. Because there is only one password file for a CDB that is common for the entire CDB, the only value possible for CON_ID is 0 for this view.                                                                                               |

 **Note:**

If the database password file name or location was recently changed, and you do not see the change reflected in this view, you can run the following SQL statement:

```
SQL> ALTER SYSTEM FLUSH PASSWORDFILE_METADATA_CACHE;
```

This statement flushes the metadata cache and updates the database to use the new password file. It also updates this view with the current password file information.

## 9.114 V\$PATCHES

V\$PATCHES shows the patches applied on an Oracle ASM instance and the list of patches applied to an Oracle Grid infrastructure home directory.

### Note:

If this view is queried in an RDBMS instance, no patch information is returned.

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PATCH_ID | NUMBER   | Patch identifier                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.115 V\$PDB\_INCARNATION

V\$PDB\_INCARNATION displays information about all PDB incarnations. Oracle creates a new PDB incarnation whenever a PDB is opened with the RESETLOGS option.

| Column                     | Datatype      | Description                                                                                                                                                                                          |
|----------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB_INCARNATION#            | NUMBER        | Database incarnation number                                                                                                                                                                          |
| PDB_INCARNATION#           | NUMBER        | PDB incarnation number                                                                                                                                                                               |
| STATUS                     | VARCHAR2 (7)  | Incarnation status: <ul style="list-style-type: none"> <li>ORPHAN: Orphan incarnation</li> <li>CURRENT: Current incarnation of the PDB</li> <li>PARENT: Parent of the current incarnation</li> </ul> |
| INCARNATION_SCN            | NUMBER        | The SCN to flashback or recover to for this PDB incarnation                                                                                                                                          |
| INCARNATION_TIME           | DATE          | The point in time recovered to for this PDB incarnation                                                                                                                                              |
| BEGIN_RESETLOGS_SCN        | NUMBER        | The SCN at the beginning of PDB resetlogs                                                                                                                                                            |
| BEGIN_RESETLOGS_TIME       | DATE          | The time at the beginning of PDB resetlogs                                                                                                                                                           |
| END_RESETLOGS_SCN          | NUMBER        | The SCN at the end of PDB resetlogs                                                                                                                                                                  |
| END_RESETLOGS_TIME         | DATE          | The time at the end of PDB resetlogs                                                                                                                                                                 |
| PRIOR_DB_INCARNATION#      | NUMBER        | Parent database incarnation number                                                                                                                                                                   |
| PRIOR_PDB_INCARNATION#     | VARCHAR2 (40) | Parent PDB incarnation number                                                                                                                                                                        |
| FLASHBACK_DATABASE_ALLOWED | VARCHAR2 (3)  | Indicates whether the PDB can be flashbacked to this incarnation as part of a flashback database operation for the CDB                                                                               |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.116 V\$PDBS

V\$PDBS displays information about PDBs associated with the current instance.

| Column     | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID     | NUMBER                      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| DBID       | NUMBER                      | PDB identifier calculated when the PDB is created and stored in all file headers associated with the PDB                                                                                                                                                                                                                                                                                                                                               |
| CON_UID    | NUMBER                      | Unique identifier associated with the PDB                                                                                                                                                                                                                                                                                                                                                                                                              |
| GUID       | RAW(16)                     | Globally unique identifier (GUID) of this PDB                                                                                                                                                                                                                                                                                                                                                                                                          |
| NAME       | VARCHAR2(128)               | Name of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OPEN_MODE  | VARCHAR2(10)                | <p>Open mode information. Possible values:</p> <ul style="list-style-type: none"> <li>MOUNTED</li> <li>READ WRITE</li> <li>READ ONLY</li> <li>MIGRATE</li> </ul>                                                                                                                                                                                                                                                                                       |
| RESTRICTED | VARCHAR2(3)                 | <p>Indicates whether only users possessing RESTRICTED SESSION privilege can connect to the PDB. Possible values:</p> <ul style="list-style-type: none"> <li>YES</li> <li>NO</li> <li>NULL</li> </ul>                                                                                                                                                                                                                                                   |
| OPEN_TIME  | TIMESTAMP(3) WITH TIME ZONE | Date and time when the database was last opened                                                                                                                                                                                                                                                                                                                                                                                                        |
| CREATE_SCN | NUMBER                      | System change number (SCN) for the creation of this PDB                                                                                                                                                                                                                                                                                                                                                                                                |
| TOTAL_SIZE | NUMBER                      | Shows the disk space (in bytes) used by the PDB, including both data and temp files.                                                                                                                                                                                                                                                                                                                                                                   |
| BLOCK_SIZE | NUMBER                      | The current block size for the PDB                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECOVERY_STATUS         | VARCHAR2 (26) | Shows the recovery status for the PDB. Possible values: <ul style="list-style-type: none"> <li>DISABLED: The PDB is offline. This is similar to all files belonging to this PDB being offline, except that all files to be added to this PDB in the future will also be offline to begin with.</li> <li>DISABLED AUTOMATIC RECOVER: Same as DISABLED, except that standby Active Data Guard recovery will automatically attempt to spawn PDB recovery isolation for the PDB and transition the PDB into ENABLED.</li> <li>ENABLED: The PDB is not offline at the PDB level. Individual files in the PDB may be online or offline at the file level.</li> </ul> |
| SNAPSHOT_PARENT_CON_ID  | NUMBER        | This column shows the container ID of the PDB that this PDB is a snapshot clone of. This column shows a nonzero value only if the PDB is a snapshot clone. For all other cases, it shows a value of 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| APPLICATION_ROOT        | VARCHAR2 (3)  | Indicates whether the PDB is an application root                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| APPLICATION_PDB         | VARCHAR2 (3)  | Indicates whether the PDB is an application PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| APPLICATION_SEED        | VARCHAR2 (3)  | Indicates whether the PDB is an application seed (an application seed is also an application PDB)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| APPLICATION_ROOT_CON_ID | NUMBER        | If this PDB is an application PDB, the container ID of an application root to which this application PDB belongs.<br>If this PDB is an application root clone, the container ID of an application root to which this application root clone belongs.<br>Otherwise, NULL.                                                                                                                                                                                                                                                                                                                                                                                       |
| APPLICATION_ROOT_CLONE  | VARCHAR2 (3)  | Indicates whether this PDB is an application root clone (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PROXY_PDB               | VARCHAR2 (3)  | Indicates whether this PDB is a proxy PDB (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| LOCAL_UNDO              | NUMBER        | Shows whether the PDB is in local undo. Possible values: <ul style="list-style-type: none"> <li>1 – PDB is in local undo mode</li> <li>0 – PDB is in shared undo mode</li> </ul> This column is not relevant for CDB\$ROOT.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| UNDO_SCN                | NUMBER        | System change number (SCN) at which the PDB was last converted from shared to local undo, or from local to shared undo.<br>This column is not relevant for CDB\$ROOT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 9.117 V\$PERSISTENT\_PUBLISHERS

`V$PERSISTENT_PUBLISHERS` displays information about all active publishers of the persistent queues in the database. There is one row per instance per queue per publisher. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column               | Datatype        | Description                                                |
|----------------------|-----------------|------------------------------------------------------------|
| QUEUE_ID             | NUMBER          | Identifier for the queue                                   |
| QUEUE_SCHEMA         | VARCHAR2 (128)  | Owner of the queue                                         |
| QUEUE_NAME           | VARCHAR2 (128)  | Name of the queue                                          |
| PUBLISHER_NAME       | VARCHAR2 (128)  | Name of the agent enqueueing the message                   |
| PUBLISHER_ADDRESS    | VARCHAR2 (1024) | Address of the publisher agent                             |
| PROTOCOL             | NUMBER          | Protocol used by the publisher's address                   |
| ENQUEUED_MSGS        | NUMBER          | Number of messages that have been enqueued                 |
| ELAPSED_ENQUEUE_TIME | NUMBER          | Total time spent doing enqueue (in hundredths of a second) |
| ENQUEUE_CPU_TIME     | NUMBER          | Total CPU time for enqueue (in hundredths of a second)     |
| LAST_ENQUEUE_TIME    | TIMESTAMP (6)   | Last enqueue message timestamp                             |
| ENQUEUE_TRANSACTIONS | NUMBER          | Number of enqueue transactions                             |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.118 V\$PERSISTENT\_QMN\_CACHE

V\$PERSISTENT\_QMN\_CACHE displays detailed information and statistics about the background activities for all queue tables in the system. There is one row per queue table. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column                         | Datatype                     | Description                                                                    |
|--------------------------------|------------------------------|--------------------------------------------------------------------------------|
| QUEUE_TABLE_ID                 | NUMBER                       | Queue table object ID                                                          |
| TYPE                           | VARCHAR2 (32)                | Type of the queue table's queue monitor cache                                  |
| STATUS                         | NUMBER                       | Status of the queue table's queue monitor cache                                |
| NEXT_SERVICE_TIME              | TIMESTAMP (3) WITH TIME ZONE | Time when the queue table should be serviced by QMON servers                   |
| WINDOW_END_TIME                | TIMESTAMP (3) WITH TIME ZONE | Time manager activity period for non-owner queue table operations              |
| TOTAL_RUNS                     | NUMBER                       | Total number of times this queue table is served                               |
| TOTAL_LATENCY                  | NUMBER                       | Cumulative latency in serving the queue table (in hundredths of a second)      |
| TOTAL_ELAPSED_TIME             | NUMBER                       | Total time spent in processing this queue table (in seconds)                   |
| TOTAL_CPU_TIME                 | NUMBER                       | Cumulative CPU time for serving the queue table (in hundredths of a second)    |
| TMGR_ROWS_PROCESSED            | NUMBER                       | Number of time manager entries processed                                       |
| TMGR_ELAPSED_TIME              | NUMBER                       | Cumulative time for time management activities (in hundredths of a second)     |
| TMGR_CPU_TIME                  | NUMBER                       | Cumulative CPU time for time management activities (in hundredths of a second) |
| LAST_TMGR_PROCESSING_TIME      | TIMESTAMP (3) WITH TIME ZONE | Last timer manager processing time                                             |
| DEQLOG_ROWS_PROCESSED          | NUMBER                       | Number of dequeue log entries processed                                        |

| CON_ID                     | NUMBER                       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.119 V\$PERSISTENT\_QUEUES

V\$PERSISTENT\_QUEUES displays information about all active persistent queues in the database since the queues' first activity time. There is one row per queue. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column                       | Datatype       | Description                                                                                                                                                                            |

| OLDEST_MSGID                  | RAW (16)      | Message ID of the oldest message in the queue                                                                                                                                                                                                                                                                                                                                                                                |
| OLDEST_MSG_ENQTM              | TIMESTAMP (6) | Enqueue time of the oldest message in the queue                                                                                                                                                                                                                                                                                                                                                                              |
| MANDATORY_AFF_SWITCHES_OUT    | NUMBER        | An affinity switch is a change in dequeue instance for a shard-subscriber pair. A mandatory affinity switch is when there are local enqueues in the queue at the instance but no local dequeues present, so the dequeue affinity is switched to another instance for that shard-subscriber pair. This column shows the number of times mandatory affinity switches were needed from this instance to another for this queue. |
| OPTIONAL_AFF_SWITCHES_OUT     | NUMBER        | Optional affinity switches are affinity switches that are not mandatory. Optional affinity switches are done for global load balancing across the Oracle Real Application Clusters (Oracle RAC) database. This column shows the number of times optional affinity switches were needed from this instance to another for this queue.                                                                                         |
| AFF_SWITCHES_BACK_IN          | NUMBER        | The number of times dequeue affinities have come back from other instances to this instance. $(MANDATORY\_AFF\_SWITCHES\_OUT + OPTIONAL\_AFF\_SWITCHES\_OUT - AFF\_SWITCHES\_BACK\_IN)$ is the number of cross instance affinities present across all shard-subscriber pair for shards owned by this instance for this queue.                                                                                                |
| CROSS_STREAM_JOBS             | NUMBER        | The number of times a shard is being forwarded to another instance due to cross instance dequeues for this queue                                                                                                                                                                                                                                                                                                             |
| RESTORE_BITMAP_JOBS           | NUMBER        | The number of times subscribers used existing shard forwarding to have cross instance dequeues for this queue                                                                                                                                                                                                                                                                                                                |
| SHADOW_AFF_SWITCHES_IN        | NUMBER        | The number of affinity switches for this queue where this instance is the dequeue instance for a shard-subscriber pair where the shard is being enqueued at another instance                                                                                                                                                                                                                                                 |
| SHADOW_AFF_SWITCHES_OUT       | NUMBER        | The number of affinity switches for this queue where shadow affinity is switched back to source instance of the shard. $(SHADOW\_AFF\_SWITCHES\_IN - SHADOW\_AFF\_SWITCHES\_OUT)$ is the number of dequeue affinities which are performing cross instance dequeues from non-local shards.                                                                                                                                    |
| SHADOW_SHARDS_RECEIVED        | NUMBER        | The number of times a shard is being forwarded from another instance to this instance due to cross instance dequeues for this queue                                                                                                                                                                                                                                                                                          |
| SHADOW_SHARDS_FREED           | NUMBER        | The number of times a forwarded shard to this instance was stopped due to removal of cross instance dequeues for this queue                                                                                                                                                                                                                                                                                                  |
| SHADOW_EVENT_STREAMS_RECEIVED | NUMBER        | The number of times an event stream is being forwarded from another instance to this instance due to cross instance dequeues for this queue                                                                                                                                                                                                                                                                                  |

| Column                         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| SHADOW_EVENT_STREAMS_FRE<br>ED | NUMBER   | The number of times a forwarded event stream to this instance was stopped due to removal of cross instance dequeues for this queue                                                                                                                                                                                                                                                                                                              |
| CON_ID                         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note:**

For sharded queues, only the following columns in this view contain accurate information: FIRST\_ACTIVITY\_TIME, BROWSED\_MSGS, LAST\_ENQUEUE\_TIME, LAST\_DEQUEUE\_TIME, ENQUEUE\_TRANSACTIONS, and DEQUEUE\_TRANSACTIONS. The rest of the columns in this view should be ignored when querying information about sharded queues.

## 9.120 V\$PERSISTENT\_SUBSCRIBERS

V\$PERSISTENT\_SUBSCRIBERS displays information about all active subscribers of the persistent queues in the database.

There is one row per instance per queue per subscriber. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

**Note:**

This view does not display information about sharded queues. For information about sharded queues, refer to the "V\$AQ\_SHARDED\_SUBSCRIBER\_STAT" view.

| Column              | Datatype        | Description                                                                                                                                                                     |
|---------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| ELAPSED_DEQUEUE_TIME | NUMBER        | Total time spent in dequeue (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                         |
| DEQUEUE_CPU_TIME     | NUMBER        | Total CPU time for dequeue (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                          |
| DEQUEUE_TRANSACTIONS | NUMBER        | Number of dequeue transactions                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EXECUTION_COUNT      | NUMBER        | Number of executions of the dequeue index cursor                                                                                                                                                                                                                                                                                                                                                                                                |
| DEQUEUE_MEMORY_LOCKS | NUMBER        | Number of dequeue transactions that obtained memory locks                                                                                                                                                                                                                                                                                                                                                                                       |
| DEQUEUE_DISK_LOCKS   | NUMBER        | Number of dequeue transactions that obtained disk locks                                                                                                                                                                                                                                                                                                                                                                                         |
| DEQUEUE_DISK_DELETES | NUMBER        | Number of dequeue transactions that deleted index-organized table entries                                                                                                                                                                                                                                                                                                                                                                       |
| OLDEST_MSGID         | RAW (16)      | Message ID of the oldest message                                                                                                                                                                                                                                                                                                                                                                                                                |
| OLDEST_MSG_ENQTM     | TIMESTAMP (6) | Enqueue time of the oldest message                                                                                                                                                                                                                                                                                                                                                                                                              |
| PARENT_SUBSCRIBER_ID | NUMBER        | Subscriber ID of the parent durable subscriber                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.121 V\$PGA\_TARGET\_ADVICE

V\$PGA\_TARGET\_ADVICE predicts how the cache hit percentage and over allocation count statistics displayed by the V\$PGASTAT performance view would be impacted if the value of the PGA\_AGGREGATE\_TARGET parameter is changed.

The prediction is performed for various values of the PGA\_AGGREGATE\_TARGET parameter, selected around its current value. The advice statistic is generated by simulating the past workload run by the instance.

The content of the view is empty if PGA\_AGGREGATE\_TARGET is not set. In addition, the content of this view is not updated if the STATISTICS\_LEVEL parameter is set to BASIC. Base statistics for this view are reset at instance startup and when the value of the PGA\_AGGREGATE\_TARGET initialization parameter is dynamically modified.

| Column                  | Datatype | Description                                                  |
|-------------------------|----------|--------------------------------------------------------------|
| PGA_TARGET_FOR_ESTIMATE | NUMBER   | Value of PGA_AGGREGATE_TARGET for this prediction (in bytes) |

| Column                        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PGA_TARGET_FACTOR             | NUMBER       | PGA_TARGET_FOR_ESTIMATE / the current value of the PGA_AGGREGATE_TARGET parameter                                                                                                                                                                                                                                                                                                                                                               |
| ADVICE_STATUS                 | VARCHAR2 (3) | Indicates whether the advice is enabled (ON) or disabled (OFF) depending on the value of the STATISTICS_LEVEL parameter                                                                                                                                                                                                                                                                                                                         |
| BYTES_PROCESSED               | NUMBER       | Total bytes processed by all the work areas considered by this advice (in bytes)                                                                                                                                                                                                                                                                                                                                                                |
| ESTD_TIME                     | NUMBER       | Time (in seconds) required to process the bytes                                                                                                                                                                                                                                                                                                                                                                                                 |
| ESTD_EXTRA_BYTES_RW           | NUMBER       | Estimated number of extra bytes which would be read or written if PGA_AGGREGATE_TARGET was set to the value of the PGA_TARGET_FOR_ESTIMATE column. This number is derived from the estimated number and size of work areas which would run in one-pass (or multi-pass) for that value of PGA_AGGREGATE_TARGET.                                                                                                                                  |
| ESTD_PGA_CACHE_HIT_PERCENTAGE | NUMBER       | Estimated value of the cache hit percentage statistic when PGA_AGGREGATE_TARGET equals PGA_TARGET_FOR_ESTIMATE. This column is derived from the above two columns and is equal to $\text{BYTES\_PROCESSED} / (\text{BYTES\_PROCESSED} + \text{ESTD\_EXTRA\_BYTES\_RW})$                                                                                                                                                                         |
| ESTD_OVERALLOC_COUNT          | NUMBER       | Estimated number of PGA memory over-allocations if the value of PGA_AGGREGATE_TARGET is set to PGA_TARGET_FOR_ESTIMATE. A nonzero value means that PGA_TARGET_FOR_ESTIMATE is not large enough to run the work area workload. Hence, the DBA should not set PGA_AGGREGATE_TARGET to PGA_TARGET_FOR_ESTIMATE since Oracle will not be able to honor that target.                                                                                 |
| CON_ID                        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.122 V\$PGA\_TARGET\_ADVICE\_HISTOGRAM

V\$PGA\_TARGET\_ADVICE\_HISTOGRAM predicts how statistics displayed by the V\$SQL\_WORKAREA\_HISTOGRAM dynamic view would be impacted if the value of the PGAAggregateTarget parameter is changed.

This prediction is performed for various values of the PGAAggregateTarget parameter, selected around its current value. The advice statistic is generated by simulating the past workload run by the instance.

The content of the view is empty if PGAAggregateTarget is not set. In addition, the content of this view is not updated when the STATISTICS\_LEVEL initialization parameter is set to BASIC. Base statistics for this view are reset at instance startup or when the value of the PGAAggregateTarget initialization parameter is dynamically modified.

| Column                      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 9.123 V\$PGASTAT

`V$PGASTAT` displays PGA memory usage statistics as well as statistics about the automatic PGA memory manager when it is enabled (that is, when `PGA_AGGREGATE_TARGET` is set). Cumulative values in `V$PGASTAT` are accumulated since instance startup.

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 9-4 V\$PGASTAT Statistics**

| Statistic Name                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aggregate PGA auto target      | Amount of PGA memory the Oracle Database can use for work areas running in automatic mode. This amount is dynamically derived from the value of the <code>PGA_AGGREGATE_TARGET</code> initialization parameter and the current work area workload, and continuously adjusted by the Oracle Database.<br><br>If this value is small compared to the value of <code>PGA_AGGREGATE_TARGET</code> , then a large amount of PGA memory is used by other components of the system (for example, PL/SQL or Java memory) and little is left for work areas. The DBA must ensure that enough PGA memory is left for work areas running in automatic mode. |
| aggregate PGA target parameter | Current value of the <code>PGA_AGGREGATE_TARGET</code> initialization parameter. If this parameter is not set, then its value is 0 and automatic management of PGA memory is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| bytes processed                | Number of bytes processed by memory intensive SQL operators, cumulated since instance startup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 9-4 (Cont.) V\$PGASTAT Statistics

| Statistic Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cache hit percentage                  | <p>A metric computed by the Oracle Database to reflect the performance of the PGA memory component, cumulative since instance startup. A value of 100% means that all work areas executed by the system since instance startup have used an optimal amount of PGA memory.</p> <p>When a work area cannot run optimal, one or more extra passes is performed over the input data. This will reduce the cache hit percentage in proportion to the size of the input data and the number of extra passes performed.</p> |
| extra bytes read/written              | Number of bytes processed during extra passes of the input data, cumulated since instance startup. When a work area cannot run optimal, one or more of these extra passes is performed.                                                                                                                                                                                                                                                                                                                              |
| global memory bound                   | <p>Maximum size of a work area executed in automatic mode. This value is continuously adjusted by the Oracle Database to reflect the current state of the work area workload. The global memory bound generally decreases when the number of active work areas is increasing in the system.</p> <p>If the value of the global bound decreases below 1 MB, then the value of <code>PGA_AGGREGATE_TARGET</code> should be increased.</p>                                                                               |
| max processes count                   | Maximum number of processes active at any one time since instance startup.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| maximum PGA allocated                 | Maximum number of bytes of PGA memory allocated at one time since instance startup.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| maximum PGA used for auto workareas   | Maximum amount of PGA memory consumed at one time by work areas running under the automatic memory management mode since instance startup.                                                                                                                                                                                                                                                                                                                                                                           |
| maximum PGA used for manual workareas | Maximum amount of PGA memory consumed at one time by work areas running under the manual memory management mode since instance startup.                                                                                                                                                                                                                                                                                                                                                                              |
| over allocation count                 | <p>This statistic is cumulative since instance startup. Over allocating PGA memory can happen if the value of <code>PGA_AGGREGATE_TARGET</code> is too small. When this happens, the Oracle Database cannot honor the value of <code>PGA_AGGREGATE_TARGET</code> and extra PGA memory needs to be allocated.</p> <p>If over allocation occurs, then increase the value of <code>PGA_AGGREGATE_TARGET</code> using the information provided by the <code>V\$PGA_TARGET_ADVICE</code> view.</p>                        |
| PGA memory freed back to OS           | Number of bytes of PGA memory freed back to the operating system, cumulated since instance startup.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| process count                         | Number of processes active within up to the last 3 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| recompute count (total)               | Number of times the instance bound, which is a cap on the maximum size of each active work area, has been recomputed since instance startup. Generally, the instance bound is recomputed in the background every 3 seconds, but it could be recomputed by a foreground process when the number of work areas changes rapidly in a short period of time.                                                                                                                                                              |
| total freeable PGA memory             | Number of bytes of PGA memory in all processes that could be freed back to the operating system.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| total PGA allocated                   | Current amount of PGA memory allocated by the instance. The Oracle Database attempts to keep this number below the value of the <code>PGA_AGGREGATE_TARGET</code> initialization parameter. However, it is possible for the PGA allocated to exceed that value by a small percentage and for a short period of time when the work area workload is increasing very rapidly or when <code>PGA_AGGREGATE_TARGET</code> is set to a small value.                                                                        |
| total PGA inuse                       | Indicates how much PGA memory is currently consumed by work areas. This number can be used to determine how much memory is consumed by other consumers of the PGA memory (for example, PL/SQL or Java).                                                                                                                                                                                                                                                                                                              |

Table 9-4 (Cont.) V\$PGASTAT Statistics

| Statistic Name                      | Description                                                                                                                                                                                                                                                |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| total PGA used for auto workareas   | Indicates how much PGA memory is currently consumed by work areas running under the automatic memory management mode. This number can be used to determine how much memory is consumed by other consumers of the PGA memory (for example, PL/SQL or Java). |
| total PGA used for manual workareas | Indicates how much PGA memory is currently consumed by work areas running under the manual memory management mode. This number can be used to determine how much memory is consumed by other consumers of the PGA memory (for example, PL/SQL or Java).    |

## 9.124 V\$PKCS11\_PATH

V\$PKCS11\_PATH displays all processes that are using a PKCS#11 library for Transparent Data Encryption (TDE).

The SQL command `ADMINISTER KEY MANAGEMENT SWITCHOVER TO LIBRARY` instructs the database to switch over from the current PKCS#11 library to a new PKCS#11 library, without incurring system downtime. After you issue this command, foreground and background processes are gradually switched over to the new library. You can use this view to monitor the PKCS#11 library being used by each process. When you determine that all processes have switched over to the new library, you can safely remove the old library from disk.

| Column          | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| PID             | NUMBER          | ID of the process                                                                                                                                                                                                                                                                                                                                                                                                                               |
| PNAME           | VARCHAR2 (5)    | Name of the process                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PKCS11_LIB_PATH | VARCHAR2 (4000) | Full operating system path for the PKCS#11 library being used by the process                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID          | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.125 V\$PLSQL\_DEBUGGABLE\_SESSIONS

V\$PLSQL\_DEBUGGABLE\_SESSIONS shows the current sessions of all users that the current user has privileges to debug with a PL/SQL debugger.

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| SERVICE_NAME             | VARCHAR2 (64)  | Service name of the session                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PLSQL_DEBUGGER_CONNECTED | VARCHAR2 (5)   | Indicates whether the session is connected to a PL/SQL debugger.<br>Possible values: <ul style="list-style-type: none"> <li>TRUE</li> <li>FALSE</li> </ul>                                                                                                                                                                                                                                                                                      |
| CON_ID                   | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.126 V\$PMEM\_FILESTORE

V\$PMEM\_FILESTORE displays information about Persistent Memory Filestores (PMEM Filestores).

| Column         | Datatype       | Description                                                                                                                                                                                             |
|----------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME           | VARCHAR2 (65)  | PMEM Filestore name                                                                                                                                                                                     |
| MOUNT_POINT    | VARCHAR2 (513) | Operating system directory path for the mount point of the PMEM Filestore                                                                                                                               |
| BACKING_FILE   | VARCHAR2 (513) | Operating system file path for the backing file of the PMEM Filestore                                                                                                                                   |
| BLOCK_SIZE     | NUMBER         | Block size of the PMEM Filestore (in bytes)                                                                                                                                                             |
| TOTAL_BYTES    | NUMBER         | Current size of the PMEM Filestore (in bytes)                                                                                                                                                           |
| AUTOEXTENSIBLE | VARCHAR2 (4)   | Indicates whether the PMEM Filestore is autoextensible (YES) or not (NO)                                                                                                                                |
| INCREMENT_BY   | NUMBER         | If the PMEM Filestore is autoextensible, then this column displays the size of an autoextension increment (in bytes)<br>If the PMEM Filestore is not autoextensible, then the value of this column is 0 |

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_BYTES       | NUMBER   | Maximum autoextend size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                     |
| AVAILABLE_BYTES | NUMBER   | Amount of free space currently available in the PMEM Filestore (in bytes)                                                                                                                                                                                                                                                                                                                                                                              |
| USED_BYTES      | NUMBER   | Amount of space currently allocated to data and metadata in the PMEM Filestore (in bytes)                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID          | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.127 V\$PQ\_SESSTAT

V\$PQ\_SESSTAT lists session statistics for parallel queries.

After you have run a query or DML operation, you can use the information derived from V\$PQ\_SESSTAT to view the number of PX (Parallel Execution) servers used, and other information for the session and system.

| Column     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTIC  | VARCHAR2 (30) | <p>Name of the statistic:</p> <ul style="list-style-type: none"> <li>Allocation Height - Requested number of PX servers per instance</li> <li>Allocation Width - Requested number of instances</li> <li>DDL Parallelized - Number of DDL operations run in parallel</li> <li>DFO Trees - Number of executed DFO trees</li> <li>DML Parallelized - Number of DML operations run in parallel</li> <li>DOP - Degree of parallelism used for the last statement</li> <li>Distr Msgs Recv'd - Number of remote (inter-instance) messages received</li> <li>Distr Msgs Sent - Number of remote (inter-instance) messages sent</li> <li>Local Msgs Recv'd - Number of local (intra-instance) messages received</li> <li>Local Msgs Sent - Number of local (intra-instance) messages sent</li> <li>Queries Parallelized - Number of queries run in parallel</li> <li>Server Sets - Maximum number of PX server sets used at the same time for the last statement</li> <li>Server Sets Released Early - Total number of PX server sets released proactively</li> <li>Servers - Maximum number of PX servers used at the same time</li> <li>Servers Released Early - Total number of PX servers released proactively</li> <li>Total Servers Released - Total number of PX servers acquired and released</li> </ul> |

## 9.128 V\$PQ\_SLAVE

V\$PQ\_SLAVE lists statistics for each of the active PX (Parallel Execution) servers on an instance.

### Note:

This view is deprecated. Oracle recommends that you instead use the V\$PX\_SERVER view.

### See Also:

"V\$PX\_SERVER"

## 9.129 V\$PQ\_SYSSTAT

V\$PQ\_SYSSTAT lists system statistics for parallel queries.

After you have run a query or DML operation, you can use the information derived from V\$PQ\_SYSSTAT to view the number of PX (Parallel Execution) servers used, and other information for the system.

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| CON_ID    | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><math>n</math>: Where <math>n</math> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 9.130 V\$PQ\_TQSTAT

V\$PQ\_TQSTAT contains statistics on parallel execution operations.

The statistics are compiled after the query completes and only remain for the duration of the session. It displays the number of rows processed through each PX (Parallel Execution) server at each stage of the execution tree. This view can help determine skew problems in a query's execution. (Note that for PDML, information from V\$PQ\_TQSTAT is available only after a commit or rollback operation.)

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DFO_NUMBER  | NUMBER        | Data flow operator (DFO) tree number to differentiate queries                                                                                                                                                                                                                                                                                                                                                                               |
| TQ_ID       | NUMBER        | Table queue ID within the query, which represents the connection between two DFO nodes in the query execution tree                                                                                                                                                                                                                                                                                                                          |
| SERVER_TYPE | VARCHAR2 (10) | The role in table queue - producer/consumer/ranger                                                                                                                                                                                                                                                                                                                                                                                          |
| NUM_ROWS    | NUMBER        | The number of rows produced/consumed                                                                                                                                                                                                                                                                                                                                                                                                        |
| BYTES       | NUMBER        | The number of bytes produced/consumed                                                                                                                                                                                                                                                                                                                                                                                                       |
| OPEN_TIME   | NUMBER        | Time (seconds) the table queue remained open                                                                                                                                                                                                                                                                                                                                                                                                |
| AVG_LATENCY | NUMBER        | Time (minutes) for a message to be dequeued after it enters the queue                                                                                                                                                                                                                                                                                                                                                                       |
| WAITS       | NUMBER        | The number of waits encountered during dequeue                                                                                                                                                                                                                                                                                                                                                                                              |
| TIMEOUTS    | NUMBER        | The number of timeouts when waiting for a message                                                                                                                                                                                                                                                                                                                                                                                           |
| PROCESS     | VARCHAR2 (6)  | Process ID                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| INSTANCE    | NUMBER        | Instance ID                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.131 V\$PROCESS

V\$PROCESS displays information about the currently active processes.

| Column | Datatype      | Description                                                                                                                                        |
|--------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDR   | RAW (4   8)   | Address of the process state object                                                                                                                |
| PID    | NUMBER        | Oracle process identifier                                                                                                                          |
| SOSID  | VARCHAR2 (24) | Operating system (process, thread) identifier.<br>This identifier is unique whether the Oracle multiprocess/multithread feature is enabled or not. |

| Column           | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPID             | VARCHAR2 (24)  | Operating system process identifier.<br>The Oracle multiprocess/multithread feature is available for UNIX systems.<br>When the Oracle multiprocess/multithread feature is enabled, RDBMS processes are mapped to threads running in operating system processes, and the <code>SPID</code> identifier is not unique for RDBMS processes.<br>When the Oracle multiprocess/multithread feature is not enabled on UNIX systems, the <code>SPID</code> identifier is unique for RDBMS processes. |
| STID             | VARCHAR2 (24)  | Operating system thread identifier.<br>The Oracle multiprocess/multithread feature is available for UNIX systems.<br>When the Oracle multiprocess/multithread feature is enabled, RDBMS processes are mapped to threads running in operating system processes, and the <code>SPID</code> and <code>STID</code> together uniquely identify an RDBMS process.<br>The <code>STID</code> is not unique on Solaris. The <code>STID</code> is unique on Linux, AIX, and Microsoft Windows.        |
| EXECUTION_TYPE   | VARCHAR2 (10)  | Operating system execution type                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PNAME            | VARCHAR2 (5)   | Name of this process                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| USERNAME         | VARCHAR2 (15)  | Operating system process username                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SERIAL#          | NUMBER         | Process serial number                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TERMINAL         | VARCHAR2 (30)  | Operating system terminal identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.132 V\$PROCESS\_MEMORY

V\$PROCESS\_MEMORY displays dynamic PGA memory usage by named component categories for each process.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID           | NUMBER        | Oracle process identifier                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SERIAL#       | NUMBER        | Oracle process serial number                                                                                                                                                                                                                                                                                                                                                                                                                |
| CATEGORY      | VARCHAR2 (15) | Category name. Categories include "SQL", "PL/SQL", "OLAP" and "JAVA". Special categories are "Freeable" and "Other". Freeable memory has been allocated to the process by the operating system, but has not been allocated to a category. "Other" memory has been allocated to a category, but not to one of the named categories.                                                                                                          |
| ALLOCATED     | NUMBER        | Bytes of PGA memory allocated by the process for the category. For the "Freeable" category, it is the amount of free PGA memory eligible to be released to the operating system.                                                                                                                                                                                                                                                            |
| USED          | NUMBER        | Bytes of PGA memory used by the process for the category. For "Freeable", the value is zero. For "Other", the value is NULL for performance reasons.                                                                                                                                                                                                                                                                                        |
| MAX_ALLOCATED | NUMBER        | Maximum bytes of PGA memory ever allocated by the process for the category.                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.133 V\$PROCESS\_MEMORY\_DETAIL

V\$PROCESS\_MEMORY\_DETAIL provides detailed information on dynamic PGA memory usage for each automatically captured snapshot.

| Column    | Datatype | Description                          |
|-----------|----------|--------------------------------------|
| PID       | NUMBER   | Oracle process identifier            |
| SERIAL#   | NUMBER   | Oracle process serial number         |
| TIMESTAMP | DATE     | Time at which the snapshot was taken |

| Column                 | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_ID                 | VARCHAR2 (13) | Identifier for the relevant SQL statement                                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_MB               | NUMBER        | Total number of megabytes of PGA memory allocated at the time of the snapshot                                                                                                                                                                                                                                                                                                                                                                         |
| CATEGORY               | VARCHAR2 (15) | Category name. Categories include: <ul style="list-style-type: none"> <li>• SQL</li> <li>• PL/SQL</li> <li>• OLAP</li> <li>• JAVA</li> <li>• Freeable</li> <li>• Other</li> </ul>                                                                                                                                                                                                                                                                     |
| NAME                   | VARCHAR2 (26) | PGA memory allocation comment. Small allocations may be grouped together with NAME set to Miscellaneous for performance reasons.                                                                                                                                                                                                                                                                                                                      |
| HEAP_NAME              | VARCHAR2 (15) | Name of heap or heaps (if same name) containing the allocations                                                                                                                                                                                                                                                                                                                                                                                       |
| BYTES                  | NUMBER        | Bytes of PGA memory allocated in the process from heaps with the given heap name and with the given allocation comment                                                                                                                                                                                                                                                                                                                                |
| ALLOCATION_COUNT       | NUMBER        | Number of allocations with the comment found in the process inside heaps with the given heap name                                                                                                                                                                                                                                                                                                                                                     |
| HEAP_DESCRIPTOR        | RAW (4   8)   | If all the allocations are from one heap, then this is the address of the heap descriptor for that heap. Otherwise, this column is NULL.                                                                                                                                                                                                                                                                                                              |
| PARENT_HEAP_DESCRIPTOR | RAW (4   8)   | If all the allocations are from one heap, then this is the address of the parent heap descriptor for that heap. Otherwise, this column is NULL. If the heap has no parent, the value is zero.                                                                                                                                                                                                                                                         |
| MOST_RECENT            | NUMBER        | Oracle process identifier (PID) for most recent snapshot                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID                 | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.134 V\$PROCESS\_POOL

V\$PROCESS\_POOL provides information about process pools.

| Column      | Datatype       | Description                                                |
|-------------|----------------|------------------------------------------------------------|
| POOL_NAME   | VARCHAR2 (512) | Pool name                                                  |
| ENABLED     | VARCHAR2 (5)   | Indicates whether the pool is active (TRUE) or not (FALSE) |
| MIN_COUNT   | NUMBER         | The default or configured minimum value                    |
| BATCH_COUNT | NUMBER         | The default or configured batch count                      |
| INIT_COUNT  | NUMBER         | The default or configured initial count                    |
| CUR_COUNT   | NUMBER         | The number of spawned processes available in this pool     |

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_COUNT | NUMBER   | When INIT_COUNT is set, MAX_COUNT shows the number of processes yet to be spawned. Note that the current process count (CUR_COUNT) cannot reach INIT_COUNT in cases where processes are consumed during the spawn.                                                                                                                                                                                                          |
| CON_ID    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This row is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li>n: Where n is the applicable container ID for the rows containing data</li></ul> |

## 9.135 V\$PROPAGATION\_RECEIVER

V\$PROPAGATION\_RECEIVER displays information about buffer queue propagation schedules on the receiving (destination) side. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when propagation migrates to another instance, or when an unscheduled propagation is attempted.

| Column                | Datatype       | Description                                                                                           |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------|
| SRC_QUEUE_SCHEMA      | VARCHAR2 (128) | Name of the source schema                                                                             |
| SRC_QUEUE_NAME        | VARCHAR2 (128) | Name of the source queue                                                                              |
| SRC_DBNAME            | VARCHAR2 (395) | Name of the source database                                                                           |
| DST_QUEUE_SCHEMA      | VARCHAR2 (128) | Name of the destination schema                                                                        |
| DST_QUEUE_NAME        | VARCHAR2 (128) | Name of the destination queue                                                                         |
| STARTUP_TIME          | DATE           | Startup time of this schedule. This time changes when the source/destination database gets restarted. |
| HIGH_WATER_MARK       | NUMBER         | High watermark of the messages received                                                               |
| ACKNOWLEDGEMENT       | NUMBER         | Acknowledgement of the messages received by the receiver                                              |
| LAST_RECEIVED_MSG     | NUMBER         | Last received message                                                                                 |
| TOTAL_MSGS            | NUMBER         | Total number of messages                                                                              |
| ELAPSED_UNPICKLE_TIME | NUMBER         | Elapsed unpickle time                                                                                 |
| ELAPSED_RULE_TIME     | NUMBER         | Elapsed rule time                                                                                     |
| ELAPSED_ENQUEUE_TIME  | NUMBER         | Elapsed enqueue time                                                                                  |
| SESSION_ID            | NUMBER         | Session ID of the propagation receiver                                                                |
| SERIAL#               | NUMBER         | Serial number of the propagation receiver                                                             |
| SPID                  | VARCHAR2 (24)  | Process identification number of the propagation receiver                                             |
| PROPAGATION_NAME      | VARCHAR2 (128) | Name of the propagation on the source database                                                        |

| Column                     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE                      | VARCHAR2 (43) | <p>State of the propagation receiver:</p> <ul style="list-style-type: none"> <li>• Initializing</li> <li>• Sending unapplied txns</li> <li>• Waiting for message from client</li> <li>• Receiving LCRs</li> <li>• Evaluating rules</li> <li>• Enqueueing LCRs</li> <li>• Waiting for memory</li> <li>• Waiting for apply to read</li> <li>• Waiting for message from propagation sender</li> </ul> <p>When the propagation schedule is not optimized, the state is <code>Normal</code>.</p> |
| LAST_RECEIVED_MSG_POSITION | RAW (64)      | Last received message position. Corresponds to <code>LAST_RECEIVED_MSG</code> , except the value is in position rather than SCN. Position is used by XStream to determine ordering.                                                                                                                                                                                                                                                                                                         |
| ACKNOWLEDGEMENT_POSITION   | RAW (64)      | Acknowledgement position of the messages received by the receiver. Corresponds to <code>ACKNOWLEDGEMENT</code> , except the value is in position rather than SCN. Position is used by XStream to determine ordering.                                                                                                                                                                                                                                                                        |
| CON_ID                     | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                |

## 9.136 V\$PROPAGATION\_SENDER

`V$PROPAGATION_SENDER` displays information about buffer queue propagation schedules on the sending (source) side. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when propagation migrates to another instance, or when an unscheduled propagation is attempted.

| Column           | Datatype       | Description                                              |
|------------------|----------------|----------------------------------------------------------|
| QUEUE_ID         | NUMBER         | Queue identifier of the queue                            |
| QUEUE_SCHEMA     | VARCHAR2 (128) | Schema of the queue                                      |
| QUEUE_NAME       | VARCHAR2 (128) | Name of the queue                                        |
| DST_QUEUE_SCHEMA | VARCHAR2 (128) | Destination schema of the queue                          |
| DST_QUEUE_NAME   | VARCHAR2 (128) | Name of the destination queue                            |
| STARTUP_TIME     | DATE           | Time at which the propagation started                    |
| DBLINK           | VARCHAR2 (395) | Name of the destination database link                    |
| HIGH_WATER_MARK  | NUMBER         | High watermark of the messages sent                      |
| ACKNOWLEDGEMENT  | NUMBER         | Acknowledgement of the messages received by the receiver |
| SCHEDULE_STATUS  | VARCHAR2 (128) | Status of the propagation schedule                       |
| TOTAL_MSGS       | NUMBER         | Total messages propagated                                |
| TOTAL_BYTES      | NUMBER         | Total bytes propagated                                   |

| Column                    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ELAPSED_DEQUEUE_TIME      | NUMBER         | Elapsed dequeue time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ELAPSED_PICKLE_TIME       | NUMBER         | Elapsed pickle time (time taken to linearize a logical change record (LCR) into a stream of bytes that can be sent over the network) (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ELAPSED_PROPAGATION_TIME  | NUMBER         | Elapsed propagation time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| STATE                     | VARCHAR2 (128) | State of the propagation sender process: <ul style="list-style-type: none"> <li>• Initializing</li> <li>• Initializing propagation receiver</li> <li>• Browsing LCRs</li> <li>• Evaluating rules</li> <li>• Dequeueing LCRs</li> <li>• Sending LCRs</li> <li>• Waiting for apply to be enabled</li> <li>• Waiting for apply database to start</li> <li>• Waiting for propagation to be enabled</li> <li>• Waiting for capture to terminate</li> <li>• Waiting for a subscriber to be added</li> <li>• Suspended due to a dropped subscriber</li> <li>• Suspended for auto split/merge</li> <li>• Waiting on empty queue</li> </ul> When the SCHEDULE_STATUS column is not SCHEDULE OPTIMIZED, the state is the value of the SCHEDULE_STATUS column. |
| CON_ID                    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                             |

## 9.137 V\$PROXY\_ARCHIVEDLOG

V\$PROXY\_ARCHIVEDLOG contains descriptions of archived log backups that were taken using the proxy copy functionality.

In a proxy copy, the media manager takes over the operations of backing up and restoring data. Each row represents a backup of one control file.

| Column            | Datatype       | Description                                                                                                                                                          |
|-------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECID             | NUMBER         | Proxy copy record identifier                                                                                                                                         |
| STAMP             | NUMBER         | Proxy copy stamp                                                                                                                                                     |
| DEVICE_TYPE       | VARCHAR2 (17)  | Type of media device that stores the proxy copy                                                                                                                      |
| HANDLE            | VARCHAR2 (513) | Name or "handle" for the proxy copy                                                                                                                                  |
| COMMENTS          | VARCHAR2 (81)  | Comments about the proxy copy                                                                                                                                        |
| MEDIA             | VARCHAR2 (65)  | A comment that contains further information about the media manager that created this backup                                                                         |
| MEDIA_POOL        | NUMBER         | Number of the media pool in which the proxy copy is stored                                                                                                           |
| TAG               | VARCHAR2 (32)  | Tag for the proxy copy                                                                                                                                               |
| STATUS            | VARCHAR2 (1)   | Status of the backup set: <ul style="list-style-type: none"> <li>• A - Available</li> <li>• U - Unavailable</li> <li>• X - Expired</li> <li>• D - Deleted</li> </ul> |
| DELETED           | VARCHAR2 (3)   | Indicates whether this record has been deleted (YES) or not (NO)                                                                                                     |
| THREAD#           | NUMBER         | Number of the redo thread                                                                                                                                            |
| SEQUENCE#         | NUMBER         | Log sequence number                                                                                                                                                  |
| RESETLOGS_CHANGE# | NUMBER         | RESETLOGS SCN of the database incarnation to which this archived log belongs                                                                                         |
| RESETLOGS_TIME    | DATE           | RESETLOGS time stamp of the database incarnation to which this archived log belongs                                                                                  |
| FIRST_CHANGE#     | NUMBER         | First SCN of this redo log                                                                                                                                           |
| FIRST_TIME        | DATE           | Time when Oracle switched into the redo log                                                                                                                          |
| NEXT_CHANGE#      | NUMBER         | First SCN of the next redo log in the thread                                                                                                                         |
| NEXT_TIME         | DATE           | First time stamp of the next redo log in the thread                                                                                                                  |
| BLOCKS            | NUMBER         | Size of this archived redo log (in operating system blocks)                                                                                                          |
| BLOCK_SIZE        | NUMBER         | Block size for the copy (in bytes)                                                                                                                                   |
| START_TIME        | DATE           | Time when the proxy copy was initiated                                                                                                                               |
| COMPLETION_TIME   | DATE           | Time when the proxy copy was completed                                                                                                                               |
| ELAPSED_SECONDS   | NUMBER         | Duration of the proxy copy                                                                                                                                           |
| RMAN_STATUS_RECID | NUMBER         | Owning V\$RMAN_STATUS record ID                                                                                                                                      |
| RMAN_STATUS_STAMP | NUMBER         | Owning V\$RMAN_STATUS stamp                                                                                                                                          |
| TERMINAL          | VARCHAR2 (3)   | Indicates whether this record corresponds to a terminal archived redo log, as defined in V\$ARCHIVED_LOG (YES) or not (NO)                                           |
| KEEP              | VARCHAR2 (3)   | Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)                       |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEEP_UNTIL   | DATE          | If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.                                                                                                                                                                                                                                                                                                                                                                                                    |
| KEEP_OPTIONS | VARCHAR2 (11) | Additional retention options for this backup set: <ul style="list-style-type: none"> <li>LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated</li> <li>BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent</li> <li>NOLOGS - Indicates a consistent backup made when the database was mounted</li> <li>NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy</li> </ul> |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                      |

## 9.138 V\$PROXY\_ARCHIVELOG\_DETAILS

V\$PROXY\_ARCHIVELOG\_DETAILS contains information about all available archive log proxy copies.

| Column            | Datatype       | Description                                                                                                                               |
|-------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_KEY       | NUMBER         | Session identifier                                                                                                                        |
| SESSION_RECID     | NUMBER         | Session recid                                                                                                                             |
| SESSION_STAMP     | NUMBER         | Session stamp                                                                                                                             |
| COPY_KEY          | NUMBER         | Copy identifier                                                                                                                           |
| THREAD#           | NUMBER         | Redo thread number                                                                                                                        |
| SEQUENCE#         | NUMBER         | Redo log sequence number                                                                                                                  |
| RESETLOGS_CHANGE# | NUMBER         | Resetlogs change number of the database when this log was written                                                                         |
| RESETLOGS_TIME    | DATE           | Resetlogs time of the database when this log was written                                                                                  |
| HANDLE            | VARCHAR2 (513) | Proxy copy handle identifies the copy for restore                                                                                         |
| MEDIA             | VARCHAR2 (65)  | Name of the media on which the copy resides. This value is informational only. It is not needed for restore.                              |
| MEDIA_POOL        | NUMBER         | Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command. |
| TAG               | VARCHAR2 (32)  | Proxy copy tag                                                                                                                            |
| FIRST_CHANGE#     | NUMBER         | First change number in the archived log                                                                                                   |
| NEXT_CHANGE#      | NUMBER         | First change number in the next log                                                                                                       |
| FIRST_TIME        | DATE           | Timestamp of the first change                                                                                                             |
| NEXT_TIME         | DATE           | Timestamp of the next change                                                                                                              |
| OUTPUT_BYTES      | NUMBER         | Total output bytes written                                                                                                                |

| Column               | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPLETION_TIME      | DATE            | Completion time                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OUTPUT_BYTES_DISPLAY | VARCHAR2 (3)    | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| KEEP                 | DATE            | Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                         |
| KEEP_UNTIL           | VARCHAR2 (11)   | If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.                                                                                                                                                                                                                                                                                                                                                                                                    |
| KEEP_OPTIONS         | VARCHAR2 (4000) | Additional retention options for this backup set: <ul style="list-style-type: none"> <li>LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated</li> <li>BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent</li> <li>NOLOGS - Indicates a consistent backup made when the database was mounted</li> <li>NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy</li> </ul> |
| CON_ID               | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                        |

## 9.139 V\$PROXY\_ARCHIVELOG\_SUMMARY

V\$PROXY\_ARCHIVELOG\_SUMMARY provides summary information about the output proxy archive log file.

| Column                    | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_FILES_BACKED          | NUMBER          | Number of archived log files backed up                                                                                                                                                                                                                                                                                                                                                                                                          |
| NUM_DISTINCT_FILES_BACKED | NUMBER          | Number of distinct archived log files backed up                                                                                                                                                                                                                                                                                                                                                                                                 |
| MIN_FIRST_CHANGE#         | NUMBER          | Minimum first change SCN                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MAX_NEXT_CHANGE#          | NUMBER          | Maximum first change SCN                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MIN_FIRST_TIME            | DATE            | Minimum first change time. Forms the redo range, along with MAX_NEXT_TIME.                                                                                                                                                                                                                                                                                                                                                                      |
| MAX_NEXT_TIME             | DATE            | Maximum next change time                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OUTPUT_BYTES              | NUMBER          | Total output size, in bytes                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OUTPUT_BYTES_DISPLAY      | VARCHAR2 (4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                    | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.140 V\$PROXY\_COPY\_DETAILS

V\$PROXY\_COPY\_DETAILS contains information about all available control file and datafile proxy copies.

| Column               | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| KEEP                 | VARCHAR2 (3)    | Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                            |
| KEEP_UNTIL           | DATE            | If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| KEEP_OPTIONS         | VARCHAR2 (11)   | Additional retention options for this backup set: <ul style="list-style-type: none"> <li>• LOGS - Indicates a long-term backup made with the <code>LOGS</code> keyword, which is now deprecated</li> <li>• BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent</li> <li>• NOLOGS - Indicates a consistent backup made when the database was mounted.</li> <li>• NULL - Indicates that this backup has no <code>KEEP</code> options and becomes obsolete based on the retention policy</li> </ul> |
| OUTPUT_BYTES_DISPLAY | VARCHAR2 (4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.141 V\$PROXY\_COPY\_SUMMARY

V\$PROXY\_COPY\_SUMMARY provides summary information about the output proxy datafile and control file.

| Column                 | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_COPIES             | NUMBER          | Number of copies created                                                                                                                                                                                                                                                                                                                                                                                                                    |
| NUM_DISTINCT_COPIES    | NUMBER          | Number of distinct copies (that contain datafiles with different checkpoints)                                                                                                                                                                                                                                                                                                                                                               |
| MIN_CHECKPOINT_CHANGE# | NUMBER          | Minimum checkpoint change SCN                                                                                                                                                                                                                                                                                                                                                                                                               |
| MAX_CHECKPOINT_CHANGE# | NUMBER          | Maximum checkpoint change SCN                                                                                                                                                                                                                                                                                                                                                                                                               |
| MIN_CHECKPOINT_TIME    | DATE            | Minimum checkpoint change time                                                                                                                                                                                                                                                                                                                                                                                                              |
| MAX_CHECKPOINT_TIME    | DATE            | Maximum checkpoint change time                                                                                                                                                                                                                                                                                                                                                                                                              |

## 9.142 V\$PROXY\_DATAFILE

V\$PROXY\_DATAFILE contains descriptions of datafile and control file backups that are taken with Proxy Copy. Each row represents a backup of one database file.

| Column      | Datatype       | Description                                                                                                                    |
|-------------|----------------|--------------------------------------------------------------------------------------------------------------------------------|
| RECID       | NUMBER         | Proxy copy record ID                                                                                                           |
| STAMP       | NUMBER         | Proxy copy record stamp                                                                                                        |
| DEVICE_TYPE | VARCHAR2 (17)  | Type of the device on which the copy resides                                                                                   |
| HANDLE      | VARCHAR2 (513) | Proxy copy handle identifies the copy for restore                                                                              |
| COMMENTS    | VARCHAR2 (81)  | Comment returned by the operating system or storage subsystem. This value is informational only. It is not needed for restore. |

| Column                 | Datatype      | Description                                                                                                                                                                                                                                                                                                                              |
|------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEDIA                  | VARCHAR2 (65) | Name of the media on which the copy resides. This value is informational only. It is not needed for restore.                                                                                                                                                                                                                             |
| MEDIA_POOL             | NUMBER        | Media pool in which the copy resides. This is the same value that was entered in the <code>POOL</code> operand of the Recovery Manager <code>BACKUP</code> command                                                                                                                                                                       |
| TAG                    | VARCHAR2 (32) | Proxy copy tag                                                                                                                                                                                                                                                                                                                           |
| STATUS                 | VARCHAR2 (1)  | Status of the backup set: <ul style="list-style-type: none"> <li>• A - Available</li> <li>• U - Unavailable</li> <li>• X - Expired</li> <li>• D - Deleted</li> </ul>                                                                                                                                                                     |
| DELETED                | VARCHAR2 (3)  | Indicates whether this record has been deleted (YES) or not (NO)                                                                                                                                                                                                                                                                         |
| FILE#                  | NUMBER        | Absolute datafile number, or 0 if this is a control file backup                                                                                                                                                                                                                                                                          |
| CREATION_CHANGE#       | NUMBER        | Datafile creation change number                                                                                                                                                                                                                                                                                                          |
| CREATION_TIME          | DATE          | Datafile creation Timestamp                                                                                                                                                                                                                                                                                                              |
| RESETLOGS_CHANGE#      | NUMBER        | Resetlogs change number of the datafile when the copy was made                                                                                                                                                                                                                                                                           |
| RESETLOGS_TIME         | DATE          | Resetlogs timestamp of the datafile when the copy was made                                                                                                                                                                                                                                                                               |
| CHECKPOINT_CHANGE#     | NUMBER        | Checkpoint change number of the datafile when the copy was made                                                                                                                                                                                                                                                                          |
| CHECKPOINT_TIME        | DATE          | Checkpoint timestamp of the datafile when the copy was made                                                                                                                                                                                                                                                                              |
| ABSOLUTE_FUZZY_CHANGE# | NUMBER        | Highest change in any block of the file, if known                                                                                                                                                                                                                                                                                        |
| RECOVERY_FUZZY_CHANGE# | NUMBER        | Highest change written to the file by media recovery                                                                                                                                                                                                                                                                                     |
| RECOVERY_FUZZY_TIME    | DATE          | Timestamp of the highest change written to the file by media recovery                                                                                                                                                                                                                                                                    |
| INCREMENTAL_LEVEL      | NUMBER        | If this backup is part of an incremental backup strategy, then 0. Otherwise null.                                                                                                                                                                                                                                                        |
| ONLINE_FUZZY           | VARCHAR2 (3)  | Indicates whether this copy was made after a crash or offline immediate (or is a copy of a copy which was taken improperly while the database was open) (YES) or not (NO). Recovery will need to apply all redo up to the next crash recovery marker to make the file consistent.                                                        |
| BACKUP_FUZZY           | VARCHAR2 (3)  | Indicates whether this is a copy taken using the <code>BEGIN BACKUP   END BACKUP</code> technique (YES) or not (NO). The <code>BEGIN BACKUP   END BACKUP</code> technique is used internally when proxy copies of open files are created. Recovery will need to apply all redo up to the end backup marker to make this copy consistent. |
| BLOCKS                 | NUMBER        | Size of the copy (in blocks). Also the size of the datafile when the copy was made.                                                                                                                                                                                                                                                      |
| BLOCK_SIZE             | NUMBER        | Block size of the datafile                                                                                                                                                                                                                                                                                                               |
| OLDEST_OFFLINE_RANGE   | NUMBER        | If the file number is 0 (that is, this is a control file backup), the RECID of the oldest offline range record in this control file copy. 0 for datafile copies.                                                                                                                                                                         |
| START_TIME             | DATE          | Starting time                                                                                                                                                                                                                                                                                                                            |
| COMPLETION_TIME        | DATE          | Completion time                                                                                                                                                                                                                                                                                                                          |
| ELAPSED_SECONDS        | NUMBER        | Number of elapsed seconds                                                                                                                                                                                                                                                                                                                |
| CONTROLFILE_TYPE       | VARCHAR2 (1)  | Type of control file: <ul style="list-style-type: none"> <li>• B - Normal control file</li> <li>• S - Standby control file</li> </ul>                                                                                                                                                                                                    |

| Column                   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEEP                     | VARCHAR2 (3)  | Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                          |
| KEEP_UNTIL               | DATE          | If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.                                                                                                                                                                                                                                                                                                                                                                                                     |
| KEEP_OPTIONS             | VARCHAR2 (11) | Additional retention options for this backup set: <ul style="list-style-type: none"> <li>LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated</li> <li>BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent</li> <li>NOLOGS - Indicates a consistent backup made when the database was mounted.</li> <li>NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy</li> </ul> |
| RMAN_STATUS_RECID        | NUMBER        | Owning V\$RMAN_STATUS record ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| RMAN_STATUS_STAMP        | NUMBER        | Owning V\$RMAN_STATUS stamp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FOREIGN_DBID             | NUMBER        | Foreign DBID of the database from which this datafile was transported. The value is 0 if the file backed up is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                                             |
| PLUGGED_READONLY         | VARCHAR2 (3)  | Indicates whether this is a proxy copy of a transported read-only foreign file (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PLUGIN_CHANGE#           | NUMBER        | SCN at which the foreign datafile was transported into the database. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                                                        |
| PLUGIN_RESETLOGS_CHANGE# | NUMBER        | SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                            |
| PLUGIN_RESETLOGS_TIME    | DATE          | Time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID                   | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                       |
| BACKED_BY_PDB            | VARCHAR2 (3)  | Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none"> <li>YES: The backup was taken when connected to the PDB</li> <li>NO: The backup was taken when connected to the root container</li> </ul>                                                                                                                                                                                                                         |
| GUID                     | RAW (16)      | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                                                                                                                                   |

## 9.143 V\$PROXY\_PDB\_TARGETS

V\$PROXY\_PDB\_TARGETS provides information about the target of a proxy PDB.

| Column         | Datatype       | Description                                                                                                                                      |
|----------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID         | NUMBER         | The ID of the container to which the data pertains. Possible values include:<br><i>n</i> : Where <i>n</i> is the container ID of a proxy PDB     |
| TARGET_PORT    | NUMBER         | Port number that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target  |
| TARGET_HOST    | VARCHAR2 (128) | Host name where the target of the proxy PDB is running, and which will be used by the proxy PDB to connect to the target                         |
| TARGET_SERVICE | VARCHAR2 (128) | Service name that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target |
| TARGET_USER    | VARCHAR2 (128) | User name used by the proxy PDB to connect to the target of the proxy PDB. If null, the name of the connected user will be used.                 |

**See Also:**

## 9.144 V\$PWFILERS\_USERS

V\$PWFILERS\_USERS lists all users in the password file, and indicates whether the user has been granted the SYSDBA, SYSOPER, SYSASM, SYSBACKUP, SYSDG, and SYSKM privileges.

| Column    | Datatype       | Description                                                                            |
|-----------|----------------|----------------------------------------------------------------------------------------|
| USERNAME  | VARCHAR2 (128) | Name of the user that is contained in the password file                                |
| SYSDBA    | VARCHAR2 (5)   | Indicates whether the user can connect with SYSDBA privileges (TRUE) or not (FALSE)    |
| SYSOPER   | VARCHAR2 (5)   | Indicates whether the user can connect with SYSOPER privileges (TRUE) or not (FALSE)   |
| SYSASM    | VARCHAR2 (5)   | Indicates whether the user can connect with SYSASM privileges (TRUE) or not (FALSE)    |
| SYSBACKUP | VARCHAR2 (5)   | Indicates whether the user can connect with SYSBACKUP privileges (TRUE) or not (FALSE) |
| SYSDG     | VARCHAR2 (5)   | Indicates whether the user can connect with SYSDG privileges (TRUE) or not (FALSE)     |
| SYSKM     | VARCHAR2 (5)   | Indicates whether the user can connect with SYSKM privileges (TRUE) or not (FALSE)     |

| Column              | Datatype                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACCOUNT_STATUS      | VARCHAR2 (30)                | <b>Account status:</b> <ul style="list-style-type: none"> <li>• OPEN</li> <li>• EXPIRED</li> <li>• EXPIRED (GRACE)</li> <li>• LOCKED (TIMED)</li> <li>• LOCKED</li> <li>• EXPIRED &amp; LOCKED (TIMED)</li> <li>• EXPIRED &amp; LOCKED</li> <li>• EXPIRED (GRACE) &amp; LOCKED</li> </ul>                                                                                                                                                                             |
| PASSWORD_PROFILE    | VARCHAR2 (128)               | <b>Password profile name</b>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LAST_LOGIN          | TIMESTAMP (9) WITH TIME ZONE | <b>The time of the last user login</b><br>This column is not populated when a user connects to the database with administrative privileges, that is, AS { SYSASM   SYSBACKUP   SYSDBA   SYSDBG   SYSOPER   SYSRAC   SYSKM }. The exception is as follows: If a user connects to the database with administrative privileges from a remote session, and the database password file format is 12.2 (V\$PASSWORDFILE_INFO.FORMAT = 12.2), then this column is populated. |
| LOCK_DATE           | DATE                         | Date the account was locked if account status was LOCKED                                                                                                                                                                                                                                                                                                                                                                                                              |
| EXPIRY_DATE         | DATE                         | Date of expiration of the account                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| EXTERNAL_NAME       | VARCHAR2 (1024)              | Shows Certificate DN or Principal Name of externally authenticated users                                                                                                                                                                                                                                                                                                                                                                                              |
| AUTHENTICATION_TYPE | VARCHAR2 (8)                 | <b>Indicates the authentication mechanism for the user:</b> <ul style="list-style-type: none"> <li>• EXTERNAL - CREATE USER <i>user1</i> IDENTIFIED EXTERNALLY;</li> <li>• GLOBAL - CREATE USER <i>user2</i> IDENTIFIED GLOBALLY;</li> <li>• PASSWORD - CREATE USER <i>user3</i> IDENTIFIED BY <i>password</i>;</li> </ul>                                                                                                                                            |
| COMMON              | VARCHAR2 (3)                 | This column has a value of YES if an administrative privilege (for example, SYSDBA) was granted with CONTAINER=ALL. Otherwise, the column has a value of NO.                                                                                                                                                                                                                                                                                                          |
| PASSWORD_VERSIONS   | VARCHAR2 (12)                | Shows the list of versions of the password hashes (also known as "verifiers") existing for the account.<br>The values for this column can include: <ul style="list-style-type: none"> <li>• 11G: If a SHA-1 hash exists</li> <li>• 12C: If a de-optimized PBKDF2-based hash exists</li> </ul> For more information about the 12C verifier, see <i>Oracle Database Concepts</i> .<br>Note that any combination of these verifiers can exist for any given account.     |
| CON_ID              | NUMBER                       | <b>The ID of the container to which the data pertains. Possible values include:</b> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>          |

## 9.145 V\$PX\_INSTANCE\_GROUP

V\$PX\_INSTANCE\_GROUP provides information about the instance groups being used for parallel operations by the current session.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QC_INSTANCE_GROUP | VARCHAR2 (64) | The instance group being used by this session for parallel operations. This value repeats for every row returned.                                                                                                                                                                                                                                                                                                                           |
| WHY               | VARCHAR2 (23) | Where the current instance group name comes from, as follows:<br>SERVICE - the instance group being used is from the session's service name<br>PARALLEL_INSTANCE_GROUP - the instance group being used is being used because the PARALLEL_INSTANCE_GROUP initialization parameter has been set.<br>The value repeats for every row returned.                                                                                                |
| INSTANCE_NUMBER   | NUMBER        | Instance number of the instance providing this instance group. There will be one row for each instance in the instance group that the Query Coordinator is using.                                                                                                                                                                                                                                                                           |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.146 V\$PX\_PROCESS

V\$PX\_PROCESS contains information about the sessions running parallel execution.

| Column      | Datatype      | Description                                           |
|-------------|---------------|-------------------------------------------------------|
| SERVER_NAME | VARCHAR2 (4)  | The name of the PX server (P000, P001, and so on)     |
| STATUS      | VARCHAR2 (9)  | The state of the PX server (IN USE or AVAILABLE)      |
| PID         | NUMBER        | The process identifier                                |
| SPID        | VARCHAR2 (24) | Operating system process ID                           |
| SID         | NUMBER        | The session ID of the PX server, if in use            |
| SERIAL#     | NUMBER        | The session serial number of the PX server, if in use |

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS_GV  | VARCHAR2 (5) | Indicates whether a PX server process in parallel is a normal process or a GV\$ process.<br>Possible values: <ul style="list-style-type: none"><li>FALSE: The PX server process in parallel is a normal process</li><li>TRUE: The PX server process in parallel is a GV\$ process</li></ul>                                                                                                                                                 |
| CON_ID | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.147 V\$PX\_PROCESS\_DETAIL

V\$PX\_PROCESS\_DETAIL lists statistics for each of the active PX (Parallel Execution) servers on an instance.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPID        | VARCHAR2 (24) | Operating system process ID                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SERVER_NAME | VARCHAR2 (7)  | Name of the PX server (P000, P001, and so on)                                                                                                                                                                                                                                                                                                                                                                                               |
| STATISTIC   | VARCHAR2 (30) | Name of the statistic: <ul style="list-style-type: none"><li>Start Time</li><li>Cleanup Start Time</li><li>Cleanup End Time</li></ul>                                                                                                                                                                                                                                                                                                       |
| VALUE       | VARCHAR2 (64) | String representation of the value the statistic<br>For example, if the value of the statistic is a timestamp, this column displays a string containing the timestamp information.                                                                                                                                                                                                                                                          |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

### Note:

This view is available starting with Oracle Database 23ai.

## 9.148 V\$PX\_PROCESS\_SYSSTAT

V\$PX\_PROCESS\_SYSSTAT contains information about the sessions running parallel execution.

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTIC | VARCHAR2 (30) | <p>Name of the statistic:</p> <ul style="list-style-type: none"> <li>• <b>Buffers Allocated</b> - Number of times a message buffer has been allocated</li> <li>• <b>Buffers Current</b> - Number of message buffers currently being used</li> <li>• <b>Buffers Freed</b> - Number of times a message buffer has been freed</li> <li>• <b>Buffers HWM</b> - Maximum number of concurrently allocated message buffers</li> <li>• <b>Chunk Lists</b> - Number of memory chunk lists</li> <li>• <b>Memory Chunks Allocated</b> - Number of large memory chunks allocated by PX servers</li> <li>• <b>Memory Chunks Current</b> - Number of large memory chunks currently being used</li> <li>• <b>Memory Chunks Freed</b> - Number of large memory chunks freed</li> <li>• <b>Memory Chunks HWM</b> - Maximum number of concurrently allocated chunks</li> <li>• <b>Memory Chunks Permanent</b> - Number of large memory chunks allocated permanently</li> <li>• <b>Server Sessions</b> - Total number of sessions created by all PX servers</li> <li>• <b>Servers Available</b> - Number of PX servers available to perform parallel operations</li> <li>• <b>Servers Cleaned Up</b> - Number of times PMON had to clean up a PX server. This should only happen during nonstandard termination of a parallel operation.<br/>If this number is large, then you should determine the cause.</li> <li>• <b>Servers Highwater</b> - Maximum number of concurrent PX server processes<br/>If this number is equal to the <code>PARALLEL_MAX_SERVERS</code> initialization parameter, then consider increasing the parameter. This could allow you to increase your throughput, especially if your system is under-utilized and the <code>V\$SYSTAT</code> statistic "Parallel operations downgraded to serial" is large.</li> <li>• <b>Servers In Use</b> - Number of PX servers currently performing parallel operations</li> <li>• <b>Servers Shutdown</b> - Number of times a PX server process has been shut down. A PX server process will be shut down if it has not been used recently.<br/>If this value is large, then consider increasing the parameter. This will improve performance by avoiding the latency of PX server process creation.</li> <li>• <b>Servers Started</b> - Number of times the system has had to create a PX server process</li> </ul> |
| VALUE     | NUMBER        | Value of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID    | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 9.149 V\$PX\_SERVER

V\$PX\_SERVER lists statistics for each of the active PX (Parallel Execution) servers on an instance.

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVER_NAME     | VARCHAR2 (4) | Name of the PX server                                                                                                                                                                                                                                                                                                                                                                                                                       |
| STATUS          | VARCHAR2 (4) | Current status of the PX server: <ul style="list-style-type: none"><li>BUSY</li><li>IDLE</li></ul>                                                                                                                                                                                                                                                                                                                                          |
| SESSIONS        | NUMBER       | Number of sessions that have used this PX server                                                                                                                                                                                                                                                                                                                                                                                            |
| IDLE_TIME_CUR   | NUMBER       | Amount of time spent idle while processing statements in the current session                                                                                                                                                                                                                                                                                                                                                                |
| BUSY_TIME_CUR   | NUMBER       | Amount of time spent busy while processing statements in the current session                                                                                                                                                                                                                                                                                                                                                                |
| CPU_SECS_CUR    | NUMBER       | Amount of CPU time (in seconds) spent on the current session                                                                                                                                                                                                                                                                                                                                                                                |
| MSG_SENT_CUR    | NUMBER       | Number of messages sent while processing statements for the current session                                                                                                                                                                                                                                                                                                                                                                 |
| MSG_RCVD_CUR    | NUMBER       | Number of messages received while processing statements for the current session                                                                                                                                                                                                                                                                                                                                                             |
| IDLE_TIME_TOTAL | NUMBER       | Total amount of time (in minutes) this PX server has been idle                                                                                                                                                                                                                                                                                                                                                                              |
| BUSY_TIME_TOTAL | NUMBER       | Total amount of time (in minutes) this PX server has been active                                                                                                                                                                                                                                                                                                                                                                            |
| CPU_SECS_TOTAL  | NUMBER       | Total amount of CPU time (in seconds) this PX server has used to process statements                                                                                                                                                                                                                                                                                                                                                         |
| MSG_SENT_TOTAL  | NUMBER       | Total number of messages this PX server has sent                                                                                                                                                                                                                                                                                                                                                                                            |
| MSG_RCVD_TOTAL  | NUMBER       | Total number of messages this PX server has received                                                                                                                                                                                                                                                                                                                                                                                        |

## 9.150 V\$PX\_SESSION

V\$PX\_SESSION contains information about the sessions running parallel execution.

| Column       | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SADDR        | RAW (4   8) | Session address                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SID          | NUMBER      | Session identifier                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SERIAL#      | NUMBER      | Session serial number                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| QCSID        | NUMBER      | Session identifier of the parallel coordinator                                                                                                                                                                                                                                                                                                                                                                                                         |
| QCSERIAL#    | NUMBER      | Session serial number of the parallel coordinator                                                                                                                                                                                                                                                                                                                                                                                                      |
| QCINST_ID    | NUMBER      | Instance number on which the parallel coordinator is running                                                                                                                                                                                                                                                                                                                                                                                           |
| SERVER_GROUP | NUMBER      | The logical group of PX servers to which this cluster database process belongs                                                                                                                                                                                                                                                                                                                                                                         |
| SERVER_SET   | NUMBER      | The logical set of PX servers to which this cluster database process belongs. A single PX server group will have at most two PX server sets.                                                                                                                                                                                                                                                                                                           |
| SERVER#      | NUMBER      | The logical number of the cluster database process within a PX server set                                                                                                                                                                                                                                                                                                                                                                              |
| DEGREE       | NUMBER      | The degree of parallelism being used by the PX server set                                                                                                                                                                                                                                                                                                                                                                                              |
| REQ_DEGREE   | NUMBER      | The degree of parallelism that was requested by the user when the statement was issued and before any resource, multiuser, or load balancing reductions                                                                                                                                                                                                                                                                                                |
| CON_ID       | NUMBER      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.151 V\$PX\_SESSTAT

V\$PX\_SESSTAT contains information about the sessions running parallel execution.

| Column       | Datatype    | Description                                                                                                                                 |
|--------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| SADDR        | RAW (4   8) | Session address                                                                                                                             |
| SID          | NUMBER      | Session identifier                                                                                                                          |

| CON_ID     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.152 V\$QMON\_COORDINATOR\_STATS

V\$QMON\_COORDINATOR\_STATS displays statistics of the non-sharded queue primary process. There is one row per instance. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column                 | Datatype                     | Description                                                                                                                                                                               |
|------------------------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QMNC_PID               | VARCHAR2 (24)                | Non-sharded queue primary process ID                                                                                                                                                      |
| STATUS                 | VARCHAR2 (24)                | Current status of the coordinator: <ul style="list-style-type: none"> <li>DEAD</li> <li>INITIALIZING</li> <li>RUNNING TASK COORDINATOR</li> <li>WAITING</li> <li>ADDING SERVER</li> </ul> |
| NUM_SERVERS            | NUMBER                       | Number of QMON servers currently running                                                                                                                                                  |
| LAST_SERVER_START_TIME | TIMESTAMP (3) WITH TIME ZONE | Last server startup time                                                                                                                                                                  |
| LAST_SERVER_PID        | VARCHAR2 (24)                | Process ID of the last server process (Qnnn) created                                                                                                                                      |
| NEXT_WAKEUP_TIME       | TIMESTAMP (3) WITH TIME ZONE | Next wakeup time of the coordinator                                                                                                                                                       |
| NEXT_READY_TIME        | TIMESTAMP (3) WITH TIME ZONE | Ready time of the first delayed task                                                                                                                                                      |
| NEXT_EXPIRY_TIME       | TIMESTAMP (3) WITH TIME ZONE | Expiry time of the next ready task                                                                                                                                                        |
| LAST_WAIT_TIME         | TIMESTAMP (3) WITH TIME ZONE | Time when the coordinator went to sleep                                                                                                                                                   |
| LAST_FAILURE           | VARCHAR2 (32)                | Last failure encountered                                                                                                                                                                  |
| LAST_FAILURE_TIME      | TIMESTAMP (3) WITH TIME ZONE | Last failure time                                                                                                                                                                         |
| MAX_TASK_LATENCY       | VARCHAR2 (40)                | Maximum task latency across all the servers (in seconds)                                                                                                                                  |
| MIN_TASK_LATENCY       | VARCHAR2 (40)                | Minimum task latency across all the servers (in seconds)                                                                                                                                  |
| TOTAL_TASK_LATENCY     | NUMBER                       | Cumulative latency across all the tasks (in seconds)                                                                                                                                      |
| TOTAL_TASKS_EXECUTED   | NUMBER                       | Cumulative number of tasks serviced by all the servers                                                                                                                                    |

| Column      | Datatype | Description                                                                                                                                          |
|-------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_SERVERS | NUMBER   | Maximum number of servers present at any point of time                                                                                               |
| CON_ID      | NUMBER   | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 9.153 V\$QMON\_SERVER\_STATS

V\$QMON\_SERVER\_STATS displays information and statistics about the active queue monitor server processes. There is one row per live queue monitor server process. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column               | Datatype                     | Description                                                                                                                                                              |
|----------------------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QMNC_PID             | VARCHAR2 (24)                | Non-sharded queue primary process ID                                                                                                                                     |
| SERVER_PID           | VARCHAR2 (24)                | Process ID of the server                                                                                                                                                 |

| NUM_TASKS            | NUMBER                       | Number of tasks processed by the server                                                                                                                                  |
| LAST_FAILURE         | VARCHAR2 (128)               | Last failure encountered by the server                                                                                                                                   |
| LAST_FAILURE_TIME    | TIMESTAMP (3) WITH TIME ZONE | Last failure time                                                                                                                                                        |
| LAST_FAILURE_TASK    | VARCHAR2 (32)                | Task being run at the time of the last failure                                                                                                                           |
| LAST_FAILURE_TASKNUM | NUMBER                       | Unique task number of the failed task                                                                                                                                    |
| CON_ID               | NUMBER                       | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.                     |

## 9.154 V\$QMON\_TASK\_STATS

V\$QMON\_TASK\_STATS displays information and statistics based on different queue monitor tasks in the system (spilling, time manager activity, and so on). There is one row per kind of task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column               | Datatype                     | Description                                                                                                                                          |
|----------------------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASK_NAME            | VARCHAR2 (32)                | Name of the task                                                                                                                                     |
| TASK_TYPE            | VARCHAR2 (40)                | Type of the task                                                                                                                                     |
| LAST_CREATED_TASKNUM | NUMBER                       | Unique task number last created for this task                                                                                                        |

| TOTAL_TASK_RUN_TIME  | NUMBER                       | Cumulative task run time                                                                                                                             |
| TOTAL_TASK_RUNS      | NUMBER                       | Cumulative task runs                                                                                                                                 |
| TOTAL_TASK_FAILURES  | NUMBER                       | Cumulative failures                                                                                                                                  |
| METRIC_TYPE          | VARCHAR2 (50)                | Type of metric gathered for this task type                                                                                                           |
| METRIC_VALUE         | NUMBER                       | Value of this metric                                                                                                                                 |
| LAST_FAILURE         | VARCHAR2 (32)                | Last failure encountered while executing this type of task                                                                                           |
| LAST_FAILURE_TIME    | TIMESTAMP (3) WITH TIME ZONE | Time when the last failure occurred                                                                                                                  |
| LAST_FAILURE_TASKNUM | NUMBER                       | Task number of the last failed task for this task                                                                                                    |
| REMARK               | VARCHAR2 (64)                | Remarks about the task                                                                                                                               |
| CON_ID               | NUMBER                       | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 9.155 V\$QMON\_TASKS

V\$QMON\_TASKS displays information and statistics about all queue background tasks in the system, which would be served by queue monitor servers. There is one row per task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

| Column           | Datatype                     | Description                               |
|------------------|------------------------------|-------------------------------------------|
| TASK_NAME        | VARCHAR2 (32)                | Task name                                 |
| TASK_NUMBER      | NUMBER                       | Unique task number                        |
| TASK_TYPE        | VARCHAR2 (40)                | Task type                                 |
| TASK_SUBMIT_TIME | TIMESTAMP (3) WITH TIME ZONE | Task submit time                          |
| TASK_READY_TIME  | TIMESTAMP (3) WITH TIME ZONE | Task ready time                           |
| TASK_EXPIRY_TIME | TIMESTAMP (3) WITH TIME ZONE | Time when this task expires               |
| TASK_START_TIME  | TIMESTAMP (3) WITH TIME ZONE | Last actual start time for the task       |
| TASK_STATUS      | VARCHAR2 (32)                | Status of the task                        |
| SERVER_NAME      | VARCHAR2 (48)                | Name of the QMON server running this task |

| Column       | Datatype | Description                                                                                                                                                       |
|--------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_RETRIES  | NUMBER   | Maximum retry count for the task                                                                                                                                  |
| NUM_RUNS     | NUMBER   | Number of runs of the task if repeatable                                                                                                                          |
| NUM_FAILURES | NUMBER   | Number of failures encountered while running the task                                                                                                             |
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. The <code>CON_ID</code> value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 9.156 V\$QUARANTINE

V\$QUARANTINE provides information about quarantined objects.

| Column    | Datatype                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT    | VARCHAR2 (64)                | Type of quarantined object (description of the memory)                                                                                                                                                                                                                                                                                                                                                                                      |
| ADDRESS   | RAW (8)                      | Address of the object                                                                                                                                                                                                                                                                                                                                                                                                                       |
| BYTES     | NUMBER                       | Amount of memory used by the object (this is the minimum amount; the actual amount may be unknown)                                                                                                                                                                                                                                                                                                                                          |
| ERROR     | VARCHAR2 (128)               | Oracle error causing quarantine                                                                                                                                                                                                                                                                                                                                                                                                             |
| TIMESTAMP | TIMESTAMP (6) WITH TIME ZONE | Time the object was quarantined                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID    | NUMBER                       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.157 V\$QUARANTINE\_SUMMARY

V\$QUARANTINE\_SUMMARY provides a summary of quarantine for each pluggable database (PDB).

| Column       | Datatype | Description                                                                              |
|--------------|----------|------------------------------------------------------------------------------------------|
| OBJECT_COUNT | NUMBER   | Number of objects in quarantine                                                          |
| OBJECT_LIMIT | NUMBER   | Limit on the number of objects that can be in quarantine before a termination will occur |
| MEMORY_TOTAL | NUMBER   | Number of bytes in quarantine                                                            |
| MEMORY_LIMIT | NUMBER   | Limit on the amount of memory that can be in quarantine before a termination will occur  |
| RECENT_COUNT | NUMBER   | Number of objects recently placed in quarantine (within the last hour)                   |
| RECENT_LIMIT | NUMBER   | Limit on the number of recently quarantined objects before a termination will occur      |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

"V\$QUARANTINE" for additional details on objects recently placed into quarantine

## 9.158 V\$QUEUE

V\$QUEUE contains information on the shared server message queues.

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PADDR  | RAW (4   8)   | Address of the process that owns the queue                                                                                                                                                                                                                                                                                                                                                                                                             |
| TYPE   | VARCHAR2 (10) | <p>Type of queue:</p> <ul style="list-style-type: none"> <li>COMMON - Processed by servers</li> <li>DISPATCHER</li> </ul>                                                                                                                                                                                                                                                                                                                              |
| QUEUED | NUMBER        | Number of items in the queue                                                                                                                                                                                                                                                                                                                                                                                                                           |
| WAIT   | NUMBER        | Total time that all items in this queue have waited (in hundredths of a second). Divide by TOTALQ for average wait per item.                                                                                                                                                                                                                                                                                                                           |
| TOTALQ | NUMBER        | Total number of items that have ever been in the queue                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.159 V\$QUEUEING\_MTH

V\$QUEUEING\_MTH displays all available queuing resource allocation methods.

| Column | Datatype      | Description                                    |
|--------|---------------|------------------------------------------------|
| NAME   | VARCHAR2 (40) | Name of the queuing resource allocation method |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.160 V\$RECOVER\_FILE

V\$RECOVER\_FILE displays the status of files needing media recovery.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#         | NUMBER        | File identifier number                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ONLINE        | VARCHAR2 (7)  | This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in ONLINE_STATUS.                                                                                                                                                                                                                                                                                                        |
| ONLINE_STATUS | VARCHAR2 (7)  | Online status (ONLINE, OFFLINE)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ERROR         | VARCHAR2 (18) | Why the file must be recovered: NULL if reason unknown, or OFFLINE NORMAL if recovery not needed                                                                                                                                                                                                                                                                                                                                                  |
| CHANGE#       | NUMBER        | SCN where recovery must start                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TIME          | DATE          | Time of SCN when recovery must start                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.161 V\$RECOVERY\_AREA\_USAGE

V\$RECOVERY\_AREA\_USAGE displays usage information about recovery areas.

| Column                    | Datatype      | Description                                                                                                                                                                                                           |
|---------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_TYPE                 | VARCHAR2 (23) | File type: <ul style="list-style-type: none"><li>• CONTROL FILE</li><li>• REDO LOG</li><li>• ARCHIVED LOG</li><li>• BACKUP PIECE</li><li>• IMAGE COPY</li><li>• FLASHBACK LOG</li><li>• REMOTE ARCHIVED LOG</li></ul> |
| PERCENT_SPACE_USED        | NUMBER        | Percent of the recovery area that is in use                                                                                                                                                                           |
| PERCENT_SPACE_RECLAIMABLE | NUMBER        | Percent of the recovery area that is reclaimable                                                                                                                                                                      |

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUMBER_OF_FILES | NUMBER   | Number of files in the recovery area                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.162 V\$RECOVERY\_FILE\_DEST

V\$RECOVERY\_FILE\_DEST displays information about the disk quota and current disk usage in the fast recovery area.

| Column            | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME              | VARCHAR2 (513) | Location name. This is the value specified in the DB_RECOVERY_FILE_DEST initialization parameter.                                                                                                                                                                                                                                                                                                                                                 |
| SPACE_LIMIT       | NUMBER         | Maximum amount of disk space (in bytes) that the database can use for the fast recovery area. This is the value specified in the DB_RECOVERY_FILE_DEST_SIZE initialization parameter.                                                                                                                                                                                                                                                             |
| SPACE_USED        | NUMBER         | Amount of disk space (in bytes) used by fast recovery area files created in current and all previous fast recovery areas. Changing fast recovery areas does not reset SPACE_USED to 0.                                                                                                                                                                                                                                                            |
| SPACE_RECLAIMABLE | NUMBER         | Total amount of disk space (in bytes) that can be created by deleting obsolete, redundant, and other low priority files from the fast recovery area                                                                                                                                                                                                                                                                                               |
| NUMBER_OF_FILES   | NUMBER         | Number of files in the fast recovery area                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID            | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.163 V\$RECOVERY\_FILE\_STATUS

V\$RECOVERY\_FILE\_STATUS contains one row for each datafile for each RECOVER statement. This view contains useful information only for the Oracle process doing the recovery. When

Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY\_FILE\_STATUS will be empty to all other Oracle users.

| Column   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILENUM  | NUMBER         | Number of the file being recovered                                                                                                                                                                                                                                                                                                                                                                                                                |
| FILENAME | VARCHAR2 (513) | Filename of the datafile being recovered                                                                                                                                                                                                                                                                                                                                                                                                          |
| STATUS   | VARCHAR2 (13)  | Status of the recovery: <ul style="list-style-type: none"><li>• IN RECOVERY</li><li>• CURRENT</li><li>• NOT RECOVERED</li></ul>                                                                                                                                                                                                                                                                                                                   |
| CON_ID   | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.164 V\$RECOVERY\_LOG

V\$RECOVERY\_LOG lists information about archived logs that are needed to complete media recovery. This information is derived from the log history view, V\$LOG\_HISTORY.

V\$RECOVERY\_LOG contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY\_LOG will be empty to all other Oracle users.

| Column       | Datatype       | Description                                                                                                                                                       |
|--------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| THREAD#      | NUMBER         | Thread number of the archived log                                                                                                                                 |
| SEQUENCE#    | NUMBER         | Sequence number of the archived log                                                                                                                               |
| TIME         | DATE           | Time of the first entry (lowest SCN) in the log                                                                                                                   |
| ARCHIVE_NAME | VARCHAR2 (513) | Name of the file when archived, using the naming convention specified by the LOG_ARCHIVE_FORMAT initialization parameter<br><b>See Also:</b> "LOG_ARCHIVE_FORMAT" |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.165 V\$RECOVERY\_PROGRESS

V\$RECOVERY\_PROGRESS can be used to track database recovery operations to ensure that they are not stalled, and also to estimate the time required to complete the operation in progress.

On non-coordinator instances, V\$RECOVERY\_PROGRESS is not populated.

On the coordinator instance (the instance where MRP0 was started to start recovery), V\$RECOVERY\_PROGRESS has the same set of rows as before, except the following rows in the ITEM column are always 0 (not used) with Multi-Instance Redo Apply:

- Active Apply
- Maximum Apply Rate
- Apply Time per Log
- Checkpoint Time per Log
- Recovery ID

V\$RECOVERY\_PROGRESS is a subview of V\$SESSION\_LONGOPS.

**Note:**

This view is populated on the instance where the MRP0 process is started if recovery is running in Multi-Instance Redo Apply mode. Not all the columns will be populated.

| Column     | Datatype      | Description                                                                                                                                                       |
|------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| START_TIME | DATE          | Start time of the recovery operation                                                                                                                              |
| TYPE       | VARCHAR2 (64) | Type of recovery operation being performed: <ul style="list-style-type: none"><li>• CRASH RECOVERY</li><li>• INSTANCE RECOVERY</li><li>• MEDIA RECOVERY</li></ul> |

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ITEM      | VARCHAR2 (32)  | <p>Item being measured.</p> <p>When TYPE is CRASH RECOVERY or INSTANCE RECOVERY, the possible values are:</p> <ul style="list-style-type: none"><li>• Log Files</li><li>• Redo Blocks</li></ul> <p>When TYPE is MEDIA RECOVERY, the possible values are:</p> <ul style="list-style-type: none"><li>• Active Apply Rate</li><li>• Average Apply Rate</li><li>• Maximum Apply Rate</li><li>• Redo Applied</li><li>• Log Files</li><li>• Last Applied Redo</li><li>• Active Time</li><li>• Elapsed Time</li><li>• Apply Time per Log</li><li>• Checkpoint Time per Log</li><li>• Standby Apply Lag</li><li>• Recovery ID</li></ul> |
| UNITS     | VARCHAR2 (32)  | The units of measurement for each item                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SOFAR     | NUMBER         | Amount of work done so far                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TOTAL     | NUMBER         | Total amount of work expected                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TIMESTAMP | DATE           | Timestamp of the last redo record applied                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| COMMENTS  | VARCHAR2 (248) | Miscellaneous notes; currently displays the SCN for the last applied redo                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID    | NUMBER         | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul>                                                                                                                                                                        |

## 9.166 V\$RECOVERY\_SLAVE

V\$RECOVERY\_SLAVE is used to track database media recovery processes to monitor their performance statistics and analyze a media recovery session.

### Note:

This view is deprecated. Oracle recommends that you instead use the V\$RECOVERY\_WORKER view.

### See Also:

"V\$RECOVERY\_WORKER"

## 9.167 V\$RECOVERY\_STATUS

V\$RECOVERY\_STATUS contains statistics of the current recovery process. This view contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY\_STATUS will be empty to all other Oracle users.

| Column              | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECOVERY_CHECKPOINT | DATE           | Point in time to which the recovery has occurred. If no logs have been applied, this is the point in time the recovery starts.                                                                                                                                                                                                                                                                                                                  |
| THREAD              | NUMBER         | Number of the redo thread currently being processed                                                                                                                                                                                                                                                                                                                                                                                             |
| SEQUENCE_NEEDED     | NUMBER         | Log sequence number of the log needed by the recovery process. The value is 0 if no log is needed.                                                                                                                                                                                                                                                                                                                                              |
| SCN_NEEDED          | VARCHAR2 (16)  | Low SCN of the log needed by recovery. The value is 0 if unknown or no log is needed.                                                                                                                                                                                                                                                                                                                                                           |
| TIME_NEEDED         | DATE           | Time when the log was created. The value is midnight on 1/1/88 if the time is unknown or if no log is needed.                                                                                                                                                                                                                                                                                                                                   |
| PREVIOUS_LOG_NAME   | VARCHAR2 (513) | Filename of the log                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PREVIOUS_LOG_STATUS | VARCHAR2 (13)  | Status of the previous log. Contains one of the following values: RELEASE; WRONG NAME; MISSING NAME; UNNEEDED NAME; NONE                                                                                                                                                                                                                                                                                                                        |
| REASON              | VARCHAR2 (13)  | Reason recovery is returning control to the user (NEED LOG LOG REUSED THREAD DISABLED)                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID              | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.169 V\$REDO\_DEST\_RESP\_HISTOGRAM

V\$REDO\_DEST\_RESP\_HISTOGRAM provides statistical information for each redo transport destination.

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEST_ID   | NUMBER        | A nonnegative integer value representing a SYNC standby destination                                                                                                                                                                                                                                                                                                                                                                               |
| TIME      | VARCHAR2 (20) | A text string that shows the last wall-clock time that a bucket was hit                                                                                                                                                                                                                                                                                                                                                                           |
| DURATION  | NUMBER        | A positive integer value that represents a bucket of seconds, 1, 2, 3, up to 300 seconds, followed by 5 additional buckets that represent 600, 1200, 2400, 4800, and 9600 (>= 4801) seconds                                                                                                                                                                                                                                                       |
| FREQUENCY | NUMBER        | A nonnegative integer that shows the number of times a particular bucket was hit by the destination specified by DEST_ID                                                                                                                                                                                                                                                                                                                          |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.170 V\$REQDIST

V\$REQDIST lists statistics for the histogram of shared server dispatcher request times, divided into 12 buckets, or ranges of time. The time ranges grow exponentially as a function of the bucket number.

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BUCKET | NUMBER   | Bucket number: 0 – 11; the maximum time for each bucket is $(4 * 2^N) / 100$ seconds                                                                                                                                                                                                                                                                                                                                                                        |
| COUNT  | NUMBER   | Count of requests whose total time to complete (excluding wait time) falls in this range                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><math>n</math>: Where <math>n</math> is the applicable container ID for the rows containing data</li> </ul> |

## 9.171 V\$RESERVED\_WORDS

V\$RESERVED\_WORDS displays a list of all SQL keywords. To determine whether a particular keyword is reserved in any way, check the RESERVED, RES\_TYPE, RES\_ATTR, and RES\_SEMI columns.

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEYWORD   | VARCHAR2 (128) | Name of the keyword                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LENGTH    | NUMBER         | Length of the keyword                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| RESERVED  | VARCHAR2 (1)   | Indicates whether the keyword cannot be used as an identifier (Y) or whether the keyword is not reserved (N)                                                                                                                                                                                                                                                                                                                                                |
| RES_TYPE  | VARCHAR2 (1)   | Indicates whether the keyword cannot be used as a type name (Y) or whether the keyword is not reserved (N)                                                                                                                                                                                                                                                                                                                                                  |
| RES_ATTR  | VARCHAR2 (1)   | Indicates whether the keyword cannot be used as an attribute name (Y) or whether the keyword is not reserved (N)                                                                                                                                                                                                                                                                                                                                            |
| RES_SEMI  | VARCHAR2 (1)   | Indicates whether the keyword is not allowed as an identifier in certain situations, such as in DML (Y) or whether the keyword is not reserved (N)                                                                                                                                                                                                                                                                                                          |
| DUPLICATE | VARCHAR2 (1)   | Indicates whether the keyword is a duplicate of another keyword (Y) or whether the keyword is not a duplicate (N)                                                                                                                                                                                                                                                                                                                                           |
| CON_ID    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><math>n</math>: Where <math>n</math> is the applicable container ID for the rows containing data</li> </ul> |

## 9.172 V\$RESOURCE

V\$RESOURCE contains resource name and address information.

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDR   | RAW (4   8)  | Address of the resource object                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TYPE   | VARCHAR2 (2) | Resource type; the resource types are listed in <a href="#">Table 9-1</a>                                                                                                                                                                                                                                                                                                                                                                       |
| ID1    | NUMBER       | Resource identifier #1                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ID2    | NUMBER       | Resource identifier #2                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.173 V\$RESOURCE\_LIMIT

V\$RESOURCE\_LIMIT displays information about global resource use for some of the system resources. Use this view to monitor the consumption of resources so that you can take corrective action, if necessary. Many of the resources correspond to initialization parameters listed in [Table 9-5](#).

Some resources, those used by DLM for example, have an initial allocation (soft limit), and the hard limit, which is theoretically infinite (although in practice it is limited by SGA size). During SGA reservation/initialization, a place is reserved in SGA for the INITIAL\_ALLOCATION of resources, but if this allocation is exceeded, additional resources are allocated up to the value indicated by LIMIT\_VALUE. The CURRENT\_UTILIZATION column indicates whether the initial allocation has been exceeded. When the initial allocation value is exceeded, the additional required resources are allocated from the shared pool, where they must compete for space with other resources.

A good choice for the value of INITIAL\_ALLOCATION will avoid the contention for space. For most resources, the value for INITIAL\_ALLOCATION is the same as the LIMIT\_VALUE. Exceeding LIMIT\_VALUE results in an error.

| Column              | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESOURCE_NAME       | VARCHAR2 (128) | Name of the resource (see <a href="#">Table 9-5</a> )                                                                                                                                                                                                                                                                                                                                                                                           |
| CURRENT_UTILIZATION | NUMBER         | Number of (resources, locks, or processes) currently being used                                                                                                                                                                                                                                                                                                                                                                                 |
| MAX_UTILIZATION     | NUMBER         | Maximum consumption of this resource since the last instance start-up                                                                                                                                                                                                                                                                                                                                                                           |
| INITIAL_ALLOCATION  | VARCHAR2 (40)  | Initial allocation. This will be equal to the value specified for the resource in the initialization parameter file (UNLIMITED for infinite allocation).                                                                                                                                                                                                                                                                                        |
| LIMIT_VALUE         | VARCHAR2 (40)  | Unlimited for resources and locks. This can be greater than the initial allocation value (UNLIMITED for infinite limit).                                                                                                                                                                                                                                                                                                                        |
| CON_ID              | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Table 9-5 Values for the RESOURCE\_NAME Column**

| Resource Name        | Corresponds to                                                                                                                         |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| DML_LOCKS            | See " <a href="#">DML_LOCKS</a> "                                                                                                      |
| ENQUEUE_LOCKS        | This value is computed by the Oracle Database. See <a href="#">V\$ENQUEUE_LOCK</a> to obtain more information about the enqueue locks. |
| GES_LOCKS            | Global Enqueue Service locks                                                                                                           |
| GES_PROCS            | Global Enqueue Service processes                                                                                                       |
| GES_RESS             | Global Enqueue Service resources                                                                                                       |
| MAX_SHARED_SERVERS   | See " <a href="#">MAX_SHARED_SERVERS</a> "                                                                                             |
| PARALLEL_MAX_SERVERS | See " <a href="#">PARALLEL_MAX_SERVERS</a> "                                                                                           |
| PROCESSES            | See " <a href="#">PROCESSES</a> "                                                                                                      |
| SESSIONS             | See " <a href="#">SESSIONS</a> "                                                                                                       |
| SORT_SEGMENT_LOCKS   | This value is computed by the Oracle Database                                                                                          |
| TEMPORARY_LOCKS      | This value is computed by the Oracle Database                                                                                          |
| TRANSACTIONS         | See " <a href="#">TRANSACTIONS</a> "                                                                                                   |

## 9.174 V\$RESTORE\_POINT

V\$RESTORE\_POINT displays information about restore points.

| Column                           | Datatype       | Description                                                                                                                                                                                                                                                      |
|----------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCN                              | NUMBER         | Database SCN when the restore point was created                                                                                                                                                                                                                  |
| DATABASE_INCARNATION#            | NUMBER         | Database incarnation number when the restore point was created                                                                                                                                                                                                   |
| GUARANTEE_FLASHBACK_DATA<br>BASE | VARCHAR2 (3)   | Indicates whether flashback log files will be kept to ensure a flashback to this point (YES) or not (NO)                                                                                                                                                         |
| STORAGE_SIZE                     | NUMBER         | Approximate number of bytes of disk space currently tied up supporting this restore point, and which would no longer be tied up if this restore point is the oldest restore point and it is dropped. This will always be zero for non-guaranteed restore points. |
| TIME                             | TIMESTAMP (9)  | Wall-clock time when the restore point was created                                                                                                                                                                                                               |
| RESTORE_POINT_TIME               | TIMESTAMP (9)  | Time that was specified when the restore point was created. If a time was not specified, this value is NULL.                                                                                                                                                     |
| PRESERVED                        | VARCHAR2 (3)   | Indicates whether the restore point must be explicitly deleted (YES) or not (NO)                                                                                                                                                                                 |
| NAME                             | VARCHAR2 (128) | Name of the restore point                                                                                                                                                                                                                                        |
| PDB_RESTORE_POINT                | VARCHAR2 (3)   | Indicates whether there is a PDB restore point for this PDB (YES) or not (NO)                                                                                                                                                                                    |
| CLEAN_PDB_RESTORE_POINT          | VARCHAR2 (3)   | Indicates whether there is a clean PDB restore point for this PDB (YES) or not (NO)                                                                                                                                                                              |
| PDB_INCARNATION#                 | NUMBER         | Pluggable database (PDB) incarnation number. This value is meaningful only for PDB restore points.                                                                                                                                                               |

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPLICATED | VARCHAR2 (3) | This column is useful in Oracle Data Guard environments. It indicates the method by which a restore point was created. Possible values: <ul style="list-style-type: none"> <li>• YES - The restore point was automatically replicated from the primary database to this database when this database was a standby database. The string <code>_PRIMARY</code> is appended to the name of such a restore point.</li> <li>• NO - The restore point was created by a user and was not replicated from the primary database.</li> </ul> |
| CON_ID     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                              |

## 9.175 V\$RESULT\_CACHE\_DEPENDENCY

V\$RESULT\_CACHE\_DEPENDENCY displays the depends-on relationship between cached results and dependencies.

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESULT_ID | NUMBER   | Cached result                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DEPEND_ID | NUMBER   | Dependency object                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OBJECT_NO | NUMBER   | Dictionary object number of the dependency object                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.176 V\$RESULT\_CACHE\_MEMORY

V\$RESULT\_CACHE\_MEMORY displays all the memory blocks and their status.

| Column      | Datatype     | Description                                                                                                                    |
|-------------|--------------|--------------------------------------------------------------------------------------------------------------------------------|
| ID          | NUMBER       | Unique block identifier (that is, the block number)                                                                            |
| CHUNK       | NUMBER       | Chunk to which the block belongs, relative to the subcache in which the memory object resides (the upper 27 bits of the ID)    |
| OFFSET      | NUMBER       | Offset of the block within its chunk, relative to the subcache in which the memory object resides (the lower 5 bits of the ID) |
| SUBCACHE_ID | NUMBER       | Subcache ID                                                                                                                    |
| FREE        | VARCHAR2 (3) | Indicates whether the block is free (YES) or not (NO)                                                                          |

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_ID | NUMBER   | Cache object to which the memory block belongs; NULL if the memory block is not allocated to a cache object (FREE = YES)                                                                                                                                                                                                                                                                                                                |
| POSITION  | NUMBER   | Position of the block in the cached object; NULL if the memory block is not allocated to a cache object (FREE = YES)                                                                                                                                                                                                                                                                                                                    |
| CON_ID    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 9.177 V\$RESULT\_CACHE\_OBJECTS

V\$RESULT\_CACHE\_OBJECTS displays all the objects (both cached results and dependencies) and their attributes.

| Column                    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                        | NUMBER         | Identifier for the cache object (also the ID of the first block)                                                                                                                                                                                                                                                                               |
| TYPE                      | VARCHAR2 (10)  | Type of the cache object: <ul style="list-style-type: none"> <li>• Dependency</li> <li>• Result</li> <li>• Temp</li> </ul>                                                                                                                                                                                                                     |
| STATUS                    | VARCHAR2 (9)   | Status of the object: <ul style="list-style-type: none"> <li>• New - Result is still under construction</li> <li>• Published - Result is available for use</li> <li>• Bypass - Result will be bypassed from use</li> <li>• Expired - Result has exceeded expiration time</li> <li>• Invalid - Result is no longer available for use</li> </ul> |
| BUCKET_NO                 | NUMBER         | Internal hash bucket for the object                                                                                                                                                                                                                                                                                                            |
| HASH                      | NUMBER         | Hash value for the object                                                                                                                                                                                                                                                                                                                      |

| OBJECT_NO <sup>2</sup>      | NUMBER         | Dictionary object number of the dependency object                                                                                                                                                                                                                                                                                                                                                                                       |
| INVALIDATIONS <sup>2</sup>  | NUMBER         | Number of times the object has invalidated its dependents                                                                                                                                                                                                                                                                                                                                                                               |
| TIME_SAVED                  | NUMBER         | Amount of time (in microseconds) saved by reuse                                                                                                                                                                                                                                                                                                                                                                                         |
| INVALIDATION_COST           | NUMBER         | Amount of time (in microseconds) spent on invalidation                                                                                                                                                                                                                                                                                                                                                                                  |
| SPACE_OVERHEAD <sup>1</sup> | NUMBER         | Overhead (in bytes) for the result                                                                                                                                                                                                                                                                                                                                                                                                      |
| SPACE_UNUSED <sup>1</sup>   | NUMBER         | Unused space (in bytes) for the result                                                                                                                                                                                                                                                                                                                                                                                                  |
| CACHE_ID                    | VARCHAR2 (387) | CacheId for the result (object name if it's a dependency)                                                                                                                                                                                                                                                                                                                                                                               |
| CACHE_KEY                   | VARCHAR2 (387) | CacheKey for the result (object name if it's a dependency)                                                                                                                                                                                                                                                                                                                                                                              |
| CHECKSUM                    | NUMBER         | Checksum for the result object. The checksum is computed over all the blocks in the result cache object minus the object header.                                                                                                                                                                                                                                                                                                        |
| EDITION_ID                  | NUMBER         | Shows the edition's object ID that was in use when the result was calculated                                                                                                                                                                                                                                                                                                                                                            |
| DB_LINK                     | VARCHAR2 (3)   | Possible values: <ul style="list-style-type: none"> <li>• YES: The result cache object references a remote database object</li> <li>• NO: The result cache object does not reference a remote database object</li> </ul>                                                                                                                                                                                                                |
| GLOBAL                      | VARCHAR2 (3)   | Possible values: <ul style="list-style-type: none"> <li>• YES: The object was fetched from the result cache of a remote database instance</li> <li>• NO: The object was recomputed on this instance, either because it was not available on a remote database instance or because the system deemed it was inefficient to fetch the object from a remote database instance</li> </ul>                                                   |
| SUBCACHE_ID                 | NUMBER         | Subcache ID                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> This column is valid only for TYPE = Result; otherwise, its value is NULL.

<sup>2</sup> This column is valid only for TYPE = Dependency; otherwise, its value is NULL.

## 9.178 V\$RESULT\_CACHE\_STATISTICS

V\$RESULT\_CACHE\_STATISTICS displays various result cache settings and usage statistics.

| Column | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID     | NUMBER         | Statistic number                                                                                                                                                                                                                                                                                                                                                                                                                            |
| NAME   | VARCHAR2 (128) | Name of the statistic (see <a href="#">Table 9-6</a> )                                                                                                                                                                                                                                                                                                                                                                                      |
| VALUE  | VARCHAR2 (81)  | Value of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

**Table 9-6 V\$RESULT\_CACHE\_STATISTICS and V\$RESULT\_SUBCACHE\_STATISTICS Statistics**

| Statistic Name               | Description                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Block Count Current          | Number of memory blocks currently allocated                                                                                             |
| Block Count Maximum          | Maximum number of memory blocks allowed                                                                                                 |
| Block Size (Bytes)           | Size of each memory block                                                                                                               |
| Create Count Failure         | Number of cache results that failed to create                                                                                           |
| Create Count Success         | Number of cache results successfully created                                                                                            |
| Delete Count Invalid         | Number of invalid cached results deleted                                                                                                |
| Delete Count Valid           | Number of valid cached results deleted                                                                                                  |
| Find Copy Count              | Number of results copied directly out of the cache                                                                                      |
| Find Count                   | Number of cached results that were successfully found                                                                                   |
| Global Load Rate             | Rate at which cached results were fetched from remote instances (in bytes per 10 milliseconds)                                          |
| Global Prune By Self Count   | Number of times this instance did not provide a cached result to a remote instance because this instance deemed it inefficient to do so |
| Global Prune Count           | Number of times this instance did not fetch a cached result from a remote instance because it was deemed inefficient to do so           |
| Hash Chain Length            | Average length of items in the hash chain                                                                                               |
| Invalidation Count           | Total number of invalidations                                                                                                           |
| Result Size Maximum (Blocks) | Maximum number of blocks allowed for a single result                                                                                    |
| Subcache Count               | Number of subcaches in the result cache                                                                                                 |

## 9.179 V\$RESULT\_SUBCACHE\_STATISTICS

V\$RESULT\_SUBCACHE\_STATISTICS displays various result cache settings and usage statistics on a per subcache basis.

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID          | NUMBER         | Statistic number                                                                                                                                                                                                                                                                                                                                                                                                              |
| NAME        | VARCHAR2 (128) | Name of the statistic<br><br>This view displays the same statistics as the V\$RESULT_CACHE_STATISTICS view. See <a href="#">Table 9-6</a> in the documentation for V\$RESULT_CACHE_STATISTICS.                                                                                                                                                                                                                                |
| VALUE       | VARCHAR2 (81)  | Value of the statistic                                                                                                                                                                                                                                                                                                                                                                                                        |
| SUBCACHE_ID | NUMBER         | Subcache ID                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li>n: Where n is the applicable container ID for the rows containing data</li></ul> |

## 9.180 V\$RMAN\_BACKUP\_JOB\_DETAILS

V\$RMAN\_BACKUP\_JOB\_DETAILS displays details about backup jobs.

| Column           | Datatype      | Description                                                                                            |
|------------------|---------------|--------------------------------------------------------------------------------------------------------|
| SESSION_KEY      | NUMBER        | Session identifier                                                                                     |
| SESSION_RECID    | NUMBER        | Together, with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V\$RMAN_OUTPUT |
| SESSION_STAMP    | NUMBER        | Together, with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V\$RMAN_OUTPUT |
| COMMAND_ID       | VARCHAR2 (33) | Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN                        |
| START_TIME       | DATE          | Start time of the first BACKUP command in the job                                                      |
| END_TIME         | DATE          | End time of the last BACKUP command in the job                                                         |
| INPUT_BYTES      | NUMBER        | Sum of all input file sizes backed up by this job                                                      |
| OUTPUT_BYTES     | NUMBER        | Output size of all pieces generated by this job                                                        |
| STATUS_WEIGHT    | NUMBER        | Used internally by Enterprise Manager                                                                  |
| OPTIMIZED_WEIGHT | NUMBER        | Used internally by Enterprise Manager                                                                  |

| Column                       | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_TYPE_WEIGHT           | NUMBER          | Used internally by Enterprise Manager                                                                                                                                                                                                                                                                                                                            |
| OUTPUT_DEVICE_TYPE           | VARCHAR2 (17)   | Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).                                                                                                                                                                                                                                                             |
| AUTOBACKUP_COUNT             | NUMBER          | Number of autobackups performed by this job                                                                                                                                                                                                                                                                                                                      |
| BACKED_BY_OSB                | VARCHAR2 (3)    | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                                                                                                                                                                                                                                        |
| AUTOBACKUP_DONE              | VARCHAR2 (3)    | YES or NO, depending upon whether or not a control file autobackup was done as part of this backup job                                                                                                                                                                                                                                                           |
| STATUS                       | VARCHAR2 (23)   | One of the following values: <ul style="list-style-type: none"> <li>RUNNING WITH WARNINGS</li> <li>RUNNING WITH ERRORS</li> <li>COMPLETED</li> <li>COMPLETED WITH WARNINGS</li> <li>COMPLETED WITH ERRORS</li> <li>FAILED</li> </ul>                                                                                                                             |
| INPUT_TYPE                   | VARCHAR2 (13)   | Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. <ul style="list-style-type: none"> <li>DB FULL</li> <li>RECVR AREA</li> <li>DB INCR</li> <li>DATAFILE FULL</li> <li>DATAFILE INCR</li> <li>ARCHIVELOG</li> <li>CONTROLFILE</li> <li>SPFILE</li> </ul> |
| OPTIMIZED                    | VARCHAR2 (3)    | YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.                                                                                                                                                                                                                                                                        |
| ELAPSED_SECONDS              | NUMBER          | Number of elapsed seconds                                                                                                                                                                                                                                                                                                                                        |
| COMPRESSION_RATIO            | NUMBER          | Compression ratio                                                                                                                                                                                                                                                                                                                                                |
| INPUT_BYTES_PER_SEC          | NUMBER          | Input read-rate-per-second                                                                                                                                                                                                                                                                                                                                       |
| OUTPUT_BYTES_PER_SEC         | NUMBER          | Output write-rate-per-second                                                                                                                                                                                                                                                                                                                                     |
| INPUT_BYTES_DISPLAY          | VARCHAR2 (4000) | Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                                                                |
| OUTPUT_BYTES_DISPLAY         | VARCHAR2 (4000) | Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on                                                                                                                                                                                                                                                                 |
| INPUT_BYTES_PER_SEC_DISPLAY  | VARCHAR2 (4000) | Input read-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                          |
| OUTPUT_BYTES_PER_SEC_DISPLAY | VARCHAR2 (4000) | Output write-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                        |
| TIME_TAKEN_DISPLAY           | VARCHAR2 (4000) | Time taken, shown in user-displayable format <nn>h:<nn>m:<nn>s                                                                                                                                                                                                                                                                                                   |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.181 V\$RMAN\_BACKUP\_SUBJOB\_DETAILS

V\$RMAN\_BACKUP\_SUBJOB\_DETAILS merges similar operations within an RMAN session into a single row. For example, if there are four BACKUP DATAFILE <n> commands, three RECOVERY COPY OF DATAFILE commands, and one BACKUP RECOVERY AREA command, this view will contain three rows - one each for BACKUP, ROLLFORWARD, and COPY\_DISK\_TO\_TAPE operation.

| Column             | Datatype      | Description                                                                                                                              |
|--------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_KEY        | NUMBER        | Session identifier                                                                                                                       |
| SESSION_RECID      | NUMBER        | Together with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V\$RMAN_OUTPUT                                    |
| SESSION_STAMP      | NUMBER        | Together with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V\$RMAN_OUTPUT                                    |
| OPERATION          | VARCHAR2 (33) | Can be BACKUP, ROLLFORWARD, VALIDATE, or COPY_DISK_TO_TAPE. A row for each suboperation type for the session will be in the output view. |
| COMMAND_ID         | VARCHAR2 (33) | Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN                                                          |
| START_TIME         | DATE          | Start time of the first BACKUP command in the job                                                                                        |
| END_TIME           | DATE          | End time of the last BACKUP command in the job                                                                                           |
| INPUT_BYTES        | NUMBER        | Sum of all input file sizes backed up by this job                                                                                        |
| OUTPUT_BYTES       | NUMBER        | Output size of all pieces generated by this job                                                                                          |
| STATUS_WEIGHT      | NUMBER        | Used internally by Enterprise Manager                                                                                                    |
| OBJECT_TYPE_WEIGHT | NUMBER        | Used internally by Enterprise Manager                                                                                                    |
| OPTIMIZED_WEIGHT   | NUMBER        | Used internally by Enterprise Manager                                                                                                    |
| OUTPUT_DEVICE_TYPE | VARCHAR2 (17) | Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).                                     |
| BACKED_BY_OSB      | VARCHAR2 (3)  | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                |
| AUTOBACKUP_DONE    | VARCHAR2 (3)  | YES or NO, depending upon whether or not a control file autobackup was done as part of this job                                          |

| Column               | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS               | VARCHAR2 (23)   | One of the following values: <ul style="list-style-type: none"> <li>RUNNING WITH WARNINGS</li> <li>RUNNING WITH ERRORS</li> <li>COMPLETED</li> <li>COMPLETED WITH WARNINGS</li> <li>COMPLETED WITH ERRORS</li> <li>FAILED</li> </ul>                                                                                                                                                                                                            |
| INPUT_TYPE           | VARCHAR2 (13)   | Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. <ul style="list-style-type: none"> <li>DB FULL</li> <li>RECVR AREA</li> <li>DB INCR</li> <li>DATAFILE FULL</li> <li>DATAFILE INCR</li> <li>ARCHIVELOG</li> <li>CONTROLFILE</li> <li>SPFILE</li> </ul>                                                                                |
| OPTIMIZED            | VARCHAR2 (3)    | YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.                                                                                                                                                                                                                                                                                                                                                       |
| AUTOBACKUP_COUNT     | NUMBER          | Number of autobackups performed by this job                                                                                                                                                                                                                                                                                                                                                                                                     |
| COMPRESSION_RATIO    | NUMBER          | Compression ratio                                                                                                                                                                                                                                                                                                                                                                                                                               |
| INPUT_BYTES_DISPLAY  | VARCHAR2 (4000) | Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                                                                                                                                               |
| OUTPUT_BYTES_DISPLAY | VARCHAR2 (4000) | Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.                                                                                                                                                                                                                                                                                                                                               |
| CON_ID               | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.182 V\$RMAN\_BACKUP\_TYPE

V\$RMAN\_BACKUP\_TYPE displays information about RMAN backup types.

| Column     | Datatype      | Description                                                                    |
|------------|---------------|--------------------------------------------------------------------------------|
| WEIGHT     | NUMBER        | Used to set precedence order of different backup types in reports.             |
| INPUT_TYPE | VARCHAR2 (13) | Used to represent possible filters used in creating various reporting screens. |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.183 V\$RMAN\_COMPRESSION\_ALGORITHM

V\$RMAN\_COMPRESSION\_ALGORITHM provides descriptions of supported compression algorithms. It is used by the RMAN client.

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ALGORITHM_ID            | NUMBER        | Algorithm ID                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ALGORITHM_NAME          | VARCHAR2 (64) | Name of the algorithm (for example, LOW, MEDIUM, DEFAULT, or HIGH)                                                                                                                                                                                                                                                                                                                                                                          |
| INITIAL_RELEASE         | VARCHAR2 (18) | First Oracle Database release when this compression algorithm was available                                                                                                                                                                                                                                                                                                                                                                 |
| TERMINAL_RELEASE        | VARCHAR2 (18) | Last Oracle Database release that supported using this compression algorithm to create new backups. Existing backups can always be restored, even if they use a deprecated compression algorithm.                                                                                                                                                                                                                                           |
| ALGORITHM_DESCRIPTION   | VARCHAR2 (64) | Description of the algorithm                                                                                                                                                                                                                                                                                                                                                                                                                |
| ALGORITHM_COMPATIBILITY | VARCHAR2 (18) | Required database compatibility level for the algorithm (for example, 11.2.0 for DEFAULT)                                                                                                                                                                                                                                                                                                                                                   |
| IS_VALID                | VARCHAR2 (3)  | Indicates whether the algorithm is valid with regard to the compatibility setting (YES) or not (NO). The value is YES if ALGORITHM_COMPATIBILITY <= DATABASE_COMPATIBILITY.                                                                                                                                                                                                                                                                 |
| REQUIRES_ACO            | VARCHAR2 (3)  | Indicates whether the algorithm requires the Advanced Compression Option (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                  |
| IS_DEFAULT              | VARCHAR2 (3)  | Indicates whether the algorithm is the default compression algorithm that RMAN uses to create compressed backup sets (YES) or not (NO)                                                                                                                                                                                                                                                                                                      |
| CON_ID                  | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.184 V\$RMAN\_CONFIGURATION

V\$RMAN\_CONFIGURATION lists information about RMAN persistent configuration settings.

| Column | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONF#  | NUMBER          | A unique key identifying this configuration record within the target database that owns it.                                                                                                                                                                                                                                                                                                                                                     |
| NAME   | VARCHAR2 (65)   | The type of configuration. All options of the <code>CONFIGURE</code> command are valid types except: <ul style="list-style-type: none"> <li>CONFIGURE EXCLUDE (described in <code>RC_TABLESPACE</code>)</li> <li>CONFIGURE AUXNAME (described in <code>RC_DATAFILE</code>)</li> <li>CONFIGURE SNAPSHOT CONTROLFILE (stored only in control file)</li> </ul>                                                                                     |
| VALUE  | VARCHAR2 (1025) | The <code>CONFIGURE</code> command setting. Example: <code>RETENTION POLICY TO RECOVERY WINDOW OF 10 DAYS</code>                                                                                                                                                                                                                                                                                                                                |
| CON_ID | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.185 V\$RMAN\_ENCRYPTION\_ALGORITHMS

`V$RMAN_ENCRYPTION_ALGORITHMS` displays supported encryption algorithms. It is used by the RMAN client to validate user-requested algorithms.

This view lists AES128, AES192, and AES256 encryption algorithms for the current release. The default algorithm is AES256.

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ALGORITHM_ID          | NUMBER        | Number to identify the algorithm                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ALGORITHM_NAME        | VARCHAR2 (64) | Name of the algorithm (for example, AES128, AES192, or AES256)                                                                                                                                                                                                                                                                                                                                                                                                 |
| ALGORITHM_DESCRIPTION | VARCHAR2 (64) | Description of the algorithm                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| IS_DEFAULT            | VARCHAR2 (3)  | Indicates whether this is the default encryption algorithm for CFB encryption mode (YES) or not (NO).<br><br>CFB encryption mode is used when the <code>COMPATIBLE</code> initialization parameter is set to a value less than 23.0.0.0. Otherwise, refer to the <code>IS_DEFAULTXTS</code> column.<br><br>This value is set by Oracle Database and may vary for each Release (that is, it is not dependent on user-specified RMAN configuration).             |
| RESTORE_ONLY          | VARCHAR2 (3)  | Indicates whether this algorithm can be used for restore only (YES) or not (NO). If the value is NO, then the algorithm is also allowed for backup. This column is useful in determining whether an encryption algorithm is deprecated for backup purpose.                                                                                                                                                                                                     |
| IS_DEFAULTXTS         | VARCHAR2 (3)  | Indicates whether this is the default encryption algorithm for XTS encryption mode (YES) or not (NO).<br><br>XTS encryption mode is used when the <code>COMPATIBLE</code> initialization parameter is set to a value greater than or equal to 23.0.0.0. Otherwise, refer to the <code>IS_DEFAULT</code> column.<br><br>This value is set by Oracle Database and may vary for each Release (that is, it is not dependent on user-specified RMAN configuration). |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.186 V\$RMAN\_OUTPUT

V\$RMAN\_OUTPUT displays messages reported by RMAN.

This is an in-memory view and is not recorded in the controlfile. The view can hold 32768 rows.

| Column            | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID               | NUMBER         | Session ID of the session which is running this RMAN operation                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| RECID             | NUMBER         | Record ID of the corresponding V\$RMAN_STATUS row                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| STAMP             | NUMBER         | Timestamp of the corresponding V\$RMAN_STATUS row                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 9.187 V\$RMAN\_STATUS

V\$RMAN\_STATUS displays the finished and on-going RMAN jobs. For on-going jobs, this view displays progress and status. The jobs which are in progress are stored only in memory while the finished jobs are stored in the controlfile.

| Column             | Datatype      | Description                                                                                                                                                                                                                                       |
|--------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                | NUMBER        | Session ID of the session which is running this RMAN operation                                                                                                                                                                                    |
| RECID              | NUMBER        | Record ID of the row in the controlfile                                                                                                                                                                                                           |
| STAMP              | NUMBER        | Timestamp of the row (RECID + STAMP is unique)                                                                                                                                                                                                    |
| PARENT_RECID       | NUMBER        | Record ID of the parent row of this row (corresponding V\$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1)                                                                                                                                         |
| PARENT_STAMP       | NUMBER        | Timestamp of the parent row of this row (corresponding V\$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1)                                                                                                                                         |
| SESSION_RECID      | NUMBER        | Record ID of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)                                                                                                                                                                    |
| SESSION_STAMP      | NUMBER        | Timestamp of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)                                                                                                                                                                    |
| ROW_LEVEL          | NUMBER        | Level of the row. The session has level 0.                                                                                                                                                                                                        |
| ROW_TYPE           | VARCHAR2 (19) | Type of the row: <ul style="list-style-type: none"> <li>SESSION</li> <li>COMMAND</li> <li>RECURSIVE OPERATION</li> </ul>                                                                                                                          |
| COMMAND_ID         | VARCHAR2 (33) | Command ID set by the RMAN SET COMMAND ID command. If not set, then RMAN will create a unique number.                                                                                                                                             |
| OPERATION          | VARCHAR2 (33) | Name of the command in the execution explained by this row                                                                                                                                                                                        |
| STATUS             | VARCHAR2 (23) | Status of the operation: <ul style="list-style-type: none"> <li>RUNNING</li> <li>RUNNING WITH WARNINGS</li> <li>RUNNING WITH ERRORS</li> <li>COMPLETED</li> <li>COMPLETED WITH WARNINGS</li> <li>COMPLETED WITH ERRORS</li> <li>FAILED</li> </ul> |
| MBYTES_PROCESSED   | NUMBER        | Percentage of the job completed; null if not applicable for the operation                                                                                                                                                                         |
| START_TIME         | DATE          | Start time of the job                                                                                                                                                                                                                             |
| END_TIME           | DATE          | End time of the job                                                                                                                                                                                                                               |
| INPUT_BYTES        | NUMBER        | Number of input bytes read                                                                                                                                                                                                                        |
| OUTPUT_BYTES       | NUMBER        | Number of output bytes written                                                                                                                                                                                                                    |
| OPTIMIZED          | VARCHAR2 (3)  | YES, if backup optimization was applied during the backup job. Otherwise, NO.                                                                                                                                                                     |
| OBJECT_TYPE        | VARCHAR2 (13) | Identifies types of objects backed up                                                                                                                                                                                                             |
| OUTPUT_DEVICE_TYPE | VARCHAR2 (17) | DISK, SBT_TAPE, or *. An * indicates that output was written to more than one device type.                                                                                                                                                        |
| OSB_ALLOCATED      | VARCHAR2 (3)  | A value of YES means an Oracle Secure Backup channel was allocated during the specified operation identified by the V\$RMAN_STATUS view.                                                                                                          |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.188 V\$RO\_USER\_ACCOUNT

V\$RO\_USER\_ACCOUNT is populated only on Oracle databases that are open in read-only mode. When a database is read-only, security data cannot be stored in normal catalogue tables. Instead, the security data is stored in an in-memory table that is queried through this view. In an Oracle Data Guard environment, some of the security information for user accounts on the standby is inherited from the primary server. For example, if the account is locked out unlimited on the primary, then it will be locked on the standby database(s). The information stored on the standby is volatile information that user actions on the standby database(s) can affect, such as the number of failed logins, and the time the account was locked on the standby due to failed access attempts. Note that failed login attempts on standbys do not affect the account status on primaries.

If this view is queried from the root in a multitenant container database (CDB), then only common users and the SYS user are returned.

If this view is queried from a pluggable database (PDB), only rows that pertain to the current PDB are returned.

| Column                 | Datatype      | Description                                                                                                        |
|------------------------|---------------|--------------------------------------------------------------------------------------------------------------------|
| USERID                 | NUMBER        | User ID number                                                                                                     |
| PASSW_EXPIRED          | NUMBER        | Indicates whether the password has expired (1) or not (0)                                                          |
| PASSW_IN_GRACE         | NUMBER        | Indicates whether the account is in grace (1) or not (0)                                                           |
| PASSW_LOCKED           | NUMBER        | Indicates whether the account is locked (1) or not (0)                                                             |
| PASSW_LOCK_UNLIM       | NUMBER        | Indicates whether the account is locked for an unlimited time (1) or not (0)                                       |
| FAILED_LOGINS          | NUMBER        | The number of failed login attempts. The count is not cumulative; it is reset upon successful logon to the account |
| EXPIRATION_AFTER_GRACE | TIMESTAMP (3) | The expiration time after grace                                                                                    |
| PASSW_LOCK_TIME        | TIMESTAMP (3) | The time the account was locked out                                                                                |

| Column   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID   | NUMBER         | <p>The ID of the container where the failed login occurred.</p> <p>For users that are not common users, the CON_ID is the PDB ID where the failed login attempt occurred.</p> <p>For common users, the CON_ID is 0.</p> <p>The login attempts that occurred on a PDB are not displayed when you query V\$RO_USER_ACCOUNT from another PDB. You only see the failed login attempts of any users (that are not common users) if those failed login attempts occurred on the same PDB from which you are querying V\$RO_USER_ACCOUNT.</p> <p>The failed login attempts of common users (and of the SYS user) are only displayed when V\$RO_USER_ACCOUNT is queried from the root of a CDB, not when it is queried from a PDB.</p> <p>In a non-CDB, the value is always 0.</p> |
| USERNAME | VARCHAR2 (128) | User name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 9.189 V\$ROLLNAME

V\$ROLLNAME lists the names of all online rollback segments. It can only be accessed when the database is open.

| Column | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USN    | NUMBER        |          | Rollback (undo) segment number                                                                                                                                                                                                                                                                                                                                                                                                                         |
| NAME   | VARCHAR2 (30) | NOT NULL | Rollback segment name                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID | NUMBER        |          | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.190 V\$ROLLSTAT

V\$ROLLSTAT contains rollback segment statistics.

| Column  | Datatype | Description                                                                                                                                                                                                                                                                                                       |
|---------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USN     | NUMBER   | Rollback segment number                                                                                                                                                                                                                                                                                           |
| LATCH   | NUMBER   | Latch for the rollback segment                                                                                                                                                                                                                                                                                    |
| EXTENTS | NUMBER   | Number of extents in the rollback segment                                                                                                                                                                                                                                                                         |
| RSSIZE  | NUMBER   | <p>Size (in bytes) of the rollback segment. This value differs by the number of bytes in one database block from the value of the BYTES column of the *_SEGMENTS view.</p> <p><b>See Also:</b> <i>Oracle Database Administrator's Guide</i> for more information about space management for rollback segments</p> |
| WRITES  | NUMBER   | Number of bytes written to the rollback segment                                                                                                                                                                                                                                                                   |

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XACTS     | NUMBER        | Number of active transactions                                                                                                                                                                                                                                                                                                                                                                                                                         |
| GETS      | NUMBER        | Number of header gets                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| WAITS     | NUMBER        | Number of header waits                                                                                                                                                                                                                                                                                                                                                                                                                                |
| OPTSIZE   | NUMBER        | Optimal size of the rollback segment                                                                                                                                                                                                                                                                                                                                                                                                                  |
| HWMSIZE   | NUMBER        | High watermark of the rollback segment size                                                                                                                                                                                                                                                                                                                                                                                                           |
| SHRINKS   | NUMBER        | Number of times the size of a rollback segment decreases                                                                                                                                                                                                                                                                                                                                                                                              |
| WRAPS     | NUMBER        | Number of times rollback segment is wrapped                                                                                                                                                                                                                                                                                                                                                                                                           |
| EXTENDS   | NUMBER        | Number of times rollback segment size is extended                                                                                                                                                                                                                                                                                                                                                                                                     |
| AVESHRINK | NUMBER        | Average shrink size                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| AVEACTIVE | NUMBER        | Current size of active extents, averaged over time.                                                                                                                                                                                                                                                                                                                                                                                                   |
| STATUS    | VARCHAR2 (15) | Rollback segment status: <ul style="list-style-type: none"> <li>• ONLINE</li> <li>• PENDING OFFLINE</li> <li>• OFFLINE</li> <li>• FULL</li> </ul>                                                                                                                                                                                                                                                                                                     |
| CUREXT    | NUMBER        | Current extent                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CURBLK    | NUMBER        | Current block                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.191 V\$ROWCACHE

V\$ROWCACHE displays statistics for data dictionary activity. Each row contains statistics for one data dictionary cache.

| Column       | Datatype      | Description                                                                                             |
|--------------|---------------|---------------------------------------------------------------------------------------------------------|
| CACHE#       | NUMBER        | Row cache ID number                                                                                     |
| TYPE         | VARCHAR2 (11) | Parent or subordinate row cache type                                                                    |
| SUBORDINATE# | NUMBER        | Subordinate set number                                                                                  |
| PARAMETER    | VARCHAR2 (32) | Name of the initialization parameter that determines the number of entries in the data dictionary cache |
| COUNT        | NUMBER        | Total number of entries in the cache                                                                    |
| USAGE        | NUMBER        | Number of cache entries that contain valid data                                                         |
| FIXED        | NUMBER        | Number of fixed entries in the cache                                                                    |
| GETS         | NUMBER        | Total number of requests for information on the data object                                             |
| FASTGETS     | NUMBER        | Reserved for internal use                                                                               |
| GETMISSES    | NUMBER        | Number of data requests resulting in cache misses                                                       |
| SCANS        | NUMBER        | Number of scan requests                                                                                 |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCANMISSES    | NUMBER   | Number of times a scan failed to find the data in the cache                                                                                                                                                                                                                                                                                                                                                                                           |
| SCANCOMPLETES | NUMBER   | For a list of subordinate entries, the number of times the list was scanned completely                                                                                                                                                                                                                                                                                                                                                                |
| MODIFICATIONS | NUMBER   | Number of inserts, updates, and deletions                                                                                                                                                                                                                                                                                                                                                                                                             |
| FLUSHES       | NUMBER   | Number of times flushed to disk                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DLM_REQUESTS  | NUMBER   | Number of DLM requests                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DLM_CONFLICTS | NUMBER   | Number of DLM conflicts                                                                                                                                                                                                                                                                                                                                                                                                                               |
|               |          | This column is obsolete and is maintained for backward compatibility.                                                                                                                                                                                                                                                                                                                                                                                 |

|               |          | This column is obsolete and is maintained for backward compatibility.                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.192 V\$ROWCACHE\_PARENT

V\$ROWCACHE\_PARENT displays information for parent objects in the data dictionary. There is one row per lock owner, and one waiter for each object. This row shows the mode held or requested. For objects with no owners or waiters, a single row is displayed.

| Column            | Datatype      | Description                                                                                                 |
|-------------------|---------------|-------------------------------------------------------------------------------------------------------------|
| INDX              | NUMBER        | Index of the row                                                                                            |
| HASH              | NUMBER        | Hash value                                                                                                  |
| ADDRESS           | RAW (4   8)   | Address of the parent object                                                                                |
| CACHE#            | NUMBER        | Parent cache ID                                                                                             |
| CACHE_NAME        | VARCHAR2 (64) | Parent cache name                                                                                           |
| EXISTENT          | VARCHAR2 (1)  | Indicates whether the object is an existing object                                                          |
| LOCK_MODE         | NUMBER        | Mode the lock is held in                                                                                    |
| LOCK_REQUEST      | NUMBER        | Mode the lock is requested in                                                                               |
| TXN               | RAW (4   8)   | Transaction currently locking the object                                                                    |
| SADDR             | RAW (4   8)   | Address of the session                                                                                      |
| INST_LOCK_REQUEST | NUMBER        | Mode in which instance lock is being requested. This column is only relevant for Real Application Clusters. |
| INST_LOCK_RELEASE | NUMBER        | Whether the instance lock needs to be released. This column is only relevant for Real Application Clusters. |
| INST_LOCK_TYPE    | VARCHAR2 (2)  | Type of instance lock. This column is only relevant for Real Application Clusters.                          |
| INST_LOCK_ID1     | RAW (4)       | ID associated with the instance lock. This column is only relevant for Real Application Clusters.           |

| Column        | Datatype  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INST_LOCK_ID2 | RAW (4)   | ID associated with the instance lock. This column is only relevant for Real Application Clusters.                                                                                                                                                                                                                                                                                                                                           |
| KEY           | RAW (100) | Contents of the key. This column is only relevant for Real Application Clusters.                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID        | NUMBER    | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.193 V\$ROWCACHE\_SUBORDINATE

V\$ROWCACHE\_SUBORDINATE displays information for subordinate objects in the data dictionary.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INDX          | NUMBER        | The index                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| HASH          | NUMBER        | The hash value                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ADDRESS       | RAW (4   8)   | Address of the subordinate object                                                                                                                                                                                                                                                                                                                                                                                                           |
| CACHE#        | NUMBER        | The parent cache ID                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SUBCACHE#     | NUMBER        | The subcache ID                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SUBCACHE_NAME | VARCHAR2 (64) | The subcache name                                                                                                                                                                                                                                                                                                                                                                                                                           |
| EXISTENT      | VARCHAR2 (1)  | Whether the object is an existing object                                                                                                                                                                                                                                                                                                                                                                                                    |
| PARENT        | RAW (4   8)   | Address of the parent object                                                                                                                                                                                                                                                                                                                                                                                                                |
| KEY           | RAW (100)     | The contents of the key                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.194 V\$RSRC\_CONS\_GROUP\_HISTORY

V\$RSRC\_CONS\_GROUP\_HISTORY displays a history of consumer group statistics for each entry in V\$RSRC\_PLAN\_HISTORY that has a non-NULL plan.

When the STATISTICS\_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

A new window is created in V\$RSRC\_CONS\_GROUP\_HISTORY when a pluggable database (PDB) changes its resource plan. The plan windows inside a PDB are not impacted by a multitenant container database (CDB) resource plan change.

Since PDB plans can be set independently across different PDBs, V\$RSRC\_CONS\_GROUP\_HISTORY will not cover the same time period across different PDBs. Therefore, this view is not useful for comparing statistics across different PDBs.

| Column                    | Datatype      | Description                                                                                                                                                                                                                                                                                                                 |
|---------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEQUENCE#                 | NUMBER        | A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.                                                                                                                                    |
| ID                        | NUMBER        | Consumer group object ID (a unique number, consistent across database shutdowns and startups)                                                                                                                                                                                                                               |
| NAME                      | VARCHAR2 (30) | Name of the consumer group                                                                                                                                                                                                                                                                                                  |
| REQUESTS                  | NUMBER        | Cumulative number of requests that were executed in the consumer group                                                                                                                                                                                                                                                      |
| CPU_WAIT_TIME             | NUMBER        | Cumulative amount of time that sessions waited for CPU on the resmgr: cpu quantum wait event because of resource management (in milliseconds). This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.          |
| CPU_WAITS                 | NUMBER        | Cumulative number of times all sessions in the consumer group had to wait for CPU on the resmgr: cpu quantum wait event because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |
| CONSUMED_CPU_TIME         | NUMBER        | Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)                                                                                                                                                                                                                              |
| YIELDS                    | NUMBER        | Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.                                                                                                              |
| CPU_DECISIONS             | NUMBER        | Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                                                                         |
| CPU_DECISIONS_EXCLUSIVE   | NUMBER        | Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                             |
| CPU_DECISIONS_WON         | NUMBER        | Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                                                                                  |
| ACTIVE_SESS_LIMIT_HIT     | NUMBER        | Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit                                                                                                                                                                                                 |
| UNDO_LIMIT_HIT            | NUMBER        | Number of times that queries in the consumer group were canceled because the consumer group reached its UNDO_POOL limit                                                                                                                                                                                                     |
| SWITCHES_IN_CPU_TIME      | NUMBER        | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit                                                                                                                                                                                                                         |
| SWITCHES_OUT_CPU_TIME     | NUMBER        | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit                                                                                                                                                                                                                       |
| SWITCHES_IN_IO_MEGABYTES  | NUMBER        | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit                                                                                                                                                                                                                 |
| SWITCHES_OUT_IO_MEGABYTES | NUMBER        | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit                                                                                                                                                                                                               |
| SWITCHES_IN_IO_REQUESTS   | NUMBER        | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit                                                                                                                                                                                                                      |

| Column                    | Datatype | Description                                                                                                                                                                                                                    |
|---------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SWITCHES_OUT_IO_REQUESTS  | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit                                                                                                                       |
| SWITCHES_IN_IO_LOGICAL    | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit                                                                                                                      |
| SWITCHES_OUT_IO_LOGICAL   | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit                                                                                                                    |
| SWITCHES_IN_ELAPSED_TIME  | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit                                                                                                                    |
| SWITCHES_OUT_ELAPSED_TIME | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit                                                                                                                  |
| SQL_CANCELED              | NUMBER   | Number of times that SQL queries running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and CANCEL_SQL was specified as the Resource Manager plan's SWITCH_GROUP |
| ACTIVE_SESS_KILLED        | NUMBER   | Number of times that sessions running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and KILL_SESSION was specified as the Resource Manager plan's SWITCH_GROUP  |
| IDLE_SESS_KILLED          | NUMBER   | Number of times that sessions in the consumer group were terminated because they were idle for too long (reached MAX_IDLE_TIME)                                                                                                |
| IDLE_BLK_R_SESS_KILLED    | NUMBER   | Number of times that sessions in the consumer group were terminated because they were idle too long (reached MAX_IDLE_BLOCKER_TIME) and were blocking other sessions                                                           |
| QUEUED_TIME               | NUMBER   | Total amount of time that sessions in the consumer group have spent in the QUEUED state because of the active session limit (in milliseconds)                                                                                  |
| QUEUE_TIME_OUTS           | NUMBER   | Number of times that requests from sessions in the consumer group timed out because they were queued for too long (reached QUEUEING_P1)                                                                                        |
| IO_SERVICE_TIME           | NUMBER   | Cumulative I/O wait time (in milliseconds)                                                                                                                                                                                     |
| IO_SERVICE_WAITS          | NUMBER   | Total number of wait requests                                                                                                                                                                                                  |
| SMALL_READ_MEGABYTES      | NUMBER   | Number of single block megabytes read                                                                                                                                                                                          |
| SMALL_WRITE_MEGABYTES     | NUMBER   | Number of single block megabytes written                                                                                                                                                                                       |
| LARGE_READ_MEGABYTES      | NUMBER   | Number of multiblock megabytes read                                                                                                                                                                                            |
| LARGE_WRITE_MEGABYTES     | NUMBER   | Number of multiblock megabytes written                                                                                                                                                                                         |
| SMALL_READ_REQUESTS       | NUMBER   | Number of single block read requests                                                                                                                                                                                           |
| SMALL_WRITE_REQUESTS      | NUMBER   | Number of single block write requests                                                                                                                                                                                          |
| LARGE_READ_REQUESTS       | NUMBER   | Number of multiblock read requests                                                                                                                                                                                             |
| LARGE_WRITE_REQUESTS      | NUMBER   | Number of multiblock write requests                                                                                                                                                                                            |
| PQS_COMPLETED             | NUMBER   | Total number of completed parallel statements in the consumer group                                                                                                                                                            |
| PQ_SERVERS_USED           | NUMBER   | Total number of parallel servers used by completed parallel statements in the consumer group                                                                                                                                   |
| PQS_QUEUED                | NUMBER   | Number of times that sessions in the consumer group were queued when trying to run parallel statements                                                                                                                         |
| PQ_ACTIVE_TIME            | NUMBER   | Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)                                                                                                      |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PQ_QUEUED_TIME            | NUMBER   | Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)                                                                                                                                                                                                                                                                                                                     |
| PQ_QUEUE_TIME_OUTS        | NUMBER   | Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's <code>PARALLEL_QUEUE_TIMEOUT</code> limit                                                                                                                                                                                                                                                    |
| PGA_LIMIT_SESSIONS_KILLED | NUMBER   | Number of times that sessions in the consumer group were terminated because their untunable PGA usage exceeded the <code>SESSION_PGA_LIMIT</code> limit                                                                                                                                                                                                                                                                                           |
| CON_ID                    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.195 V\$RSRC\_CONSUMER\_GROUP

V\$RSRC\_CONSUMER\_GROUP displays data related to currently active resource consumer groups.

When the `STATISTICS_LEVEL` is set to `TYPICAL` or `ALL`, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

Statistics in V\$RSRC\_CONSUMER\_GROUP are reset when a pluggable database (PDB) changes its resource plan. They are not impacted by multitenant container database (CDB) resource plan changes.

Since PDB plans can be set independently across different PDBs, V\$RSRC\_CONSUMER\_GROUP will not cover the same time period across different PDBs. Therefore, this view is not useful for comparing statistics across different PDBs.

| Column            | Datatype      | Description                                                                                                   |
|-------------------|---------------|---------------------------------------------------------------------------------------------------------------|
| ID                | NUMBER        | Consumer group object ID (a unique number, consistent across database shutdowns and startups)                 |
| NAME              | VARCHAR2 (32) | Name of the consumer group                                                                                    |
| ACTIVE_SESSIONS   | NUMBER        | Number of currently active sessions in the consumer group                                                     |
| EXECUTION_WAITERS | NUMBER        | Number of currently active sessions waiting for an execution time slice in which they will be able to use CPU |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                 |
|---------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REQUESTS                  | NUMBER   | Cumulative number of requests that were executed in the consumer group                                                                                                                                                                                                                                                      |
| CPU_WAIT_TIME             | NUMBER   | Cumulative amount of time that sessions waited for CPU on the resmgr: cpu quantum wait event because of resource management (in milliseconds). This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.          |
| CPU_WAITS                 | NUMBER   | Cumulative number of times all sessions in the consumer group had to wait for CPU on the resmgr: cpu quantum wait event because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |
| CONSUMED_CPU_TIME         | NUMBER   | Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)                                                                                                                                                                                                                              |
| YIELDS                    | NUMBER   | Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.                                                                                                              |
| CPU_DECISIONS             | NUMBER   | Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                                                                         |
| CPU_DECISIONS_EXCLUSIVE   | NUMBER   | Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                             |
| CPU_DECISIONS_WON         | NUMBER   | Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                                                                                  |
| QUEUE_LENGTH              | NUMBER   | Number of sessions waiting in the queue                                                                                                                                                                                                                                                                                     |
| CURRENT_UNDO_CONSUMPTION  | NUMBER   | Current amount (in KB) of undo consumed by the consumer group                                                                                                                                                                                                                                                               |
| ACTIVE_SESSION_LIMIT_HIT  | NUMBER   | Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit                                                                                                                                                                                                 |
| UNDO_LIMIT_HIT            | NUMBER   | Number of times that queries in the consumer group were canceled because the consumer group reached its UNDO_POOL limit                                                                                                                                                                                                     |
| SWITCHES_IN_CPU_TIME      | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit                                                                                                                                                                                                                         |
| SWITCHES_OUT_CPU_TIME     | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit                                                                                                                                                                                                                       |
| SWITCHES_IN_IO_MEGABYTES  | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit                                                                                                                                                                                                                 |
| SWITCHES_OUT_IO_MEGABYTES | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit                                                                                                                                                                                                               |
| SWITCHES_IN_IO_REQUESTS   | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit                                                                                                                                                                                                                      |
| SWITCHES_OUT_IO_REQUESTS  | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit                                                                                                                                                                                                                    |
| SWITCHES_IN_IO_LOGICAL    | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit                                                                                                                                                                                                                   |
| SWITCHES_OUT_IO_LOGICAL   | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit                                                                                                                                                                                                                 |

| Column                    | Datatype | Description                                                                                                                                                                                                                    |
|---------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SWITCHES_IN_ELAPSED_TIME  | NUMBER   | Number of switches into the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit                                                                                                                    |
| SWITCHES_OUT_ELAPSED_TIME | NUMBER   | Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit                                                                                                                  |
| SQL_CANCELED              | NUMBER   | Number of times that SQL queries running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and CANCEL_SQL was specified as the Resource Manager plan's SWITCH_GROUP |
| ACTIVE_SESSIONS_KILLED    | NUMBER   | Number of times that sessions running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and KILL_SESSION was specified as the Resource Manager plan's SWITCH_GROUP  |
| IDLE_SESSIONS_KILLED      | NUMBER   | Number of times that sessions in the consumer group were terminated because they were idle for too long (reached MAX_IDLE_TIME)                                                                                                |
| IDLE_BLK_SESSIONS_KILLED  | NUMBER   | Number of times that sessions in the consumer group were terminated because they were idle too long (reached MAX_IDLE_BLOCKER_TIME) and were blocking other sessions                                                           |
| QUEUED_TIME               | NUMBER   | Total amount of time that sessions in the consumer group have spent in the QUEUED state because of the active session limit (in milliseconds)                                                                                  |
| QUEUE_TIME_OUTS           | NUMBER   | Number of times that requests from sessions in the consumer group timed out because they were queued for too long (reached QUEUING_P1)                                                                                         |
| IO_SERVICE_TIME           | NUMBER   | Cumulative I/O wait time (in milliseconds)                                                                                                                                                                                     |
| IO_SERVICE_WAITS          | NUMBER   | Total number of wait requests                                                                                                                                                                                                  |
| SMALL_READ_MEGABYTES      | NUMBER   | Number of single block megabytes read                                                                                                                                                                                          |
| SMALL_WRITE_MEGABYTES     | NUMBER   | Number of single block megabytes written                                                                                                                                                                                       |
| LARGE_READ_MEGABYTES      | NUMBER   | Number of multiblock megabytes read                                                                                                                                                                                            |
| LARGE_WRITE_MEGABYTES     | NUMBER   | Number of multiblock megabytes written                                                                                                                                                                                         |
| SMALL_READ_REQUESTS       | NUMBER   | Number of single block read requests                                                                                                                                                                                           |
| SMALL_WRITE_REQUESTS      | NUMBER   | Number of single block write requests                                                                                                                                                                                          |
| LARGE_READ_REQUESTS       | NUMBER   | Number of multiblock read requests                                                                                                                                                                                             |
| LARGE_WRITE_REQUESTS      | NUMBER   | Number of multiblock write requests                                                                                                                                                                                            |
| CURRENT_PQS_ACTIVE        | NUMBER   | Number of active parallel statements in the consumer group. This value does not include parallel statements that are never queued, such as GV\$ queries.                                                                       |
| CURRENT_PQ_SERVERS_ACTIVE | NUMBER   | Number of active parallel servers in the consumer group. This value does not include servers running parallel statements that are never queued, such as GV\$ queries.                                                          |
| PQS_QUEUED                | NUMBER   | Number of times that sessions in the consumer group were queued when trying to run parallel statements                                                                                                                         |
| PQS_COMPLETED             | NUMBER   | Total number of completed parallel statements in the consumer group                                                                                                                                                            |
| PQ_SERVERS_USED           | NUMBER   | Total number of parallel servers used by completed parallel statements in the consumer group                                                                                                                                   |
| PQ_ACTIVE_TIME            | NUMBER   | Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)                                                                                                      |
| CURRENT_PQS_QUEUED        | NUMBER   | Number of sessions in the consumer group that are waiting in the parallel statement queue trying to run parallel statements                                                                                                    |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PQ_QUEUED_TIME            | NUMBER   | Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)                                                                                                                                                                                                                                                                                                                     |
| PQ_QUEUE_TIME_OUTS        | NUMBER   | Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's <code>PARALLEL_QUEUE_TIMEOUT</code> limit                                                                                                                                                                                                                                                    |
| PGA_LIMIT_SESSIONS_KILLED | NUMBER   | Number of times that sessions in the consumer group were terminated because their untunable PGA usage exceeded the <code>SESSION_PGA_LIMIT</code> limit                                                                                                                                                                                                                                                                                           |
| CON_ID                    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.197 V\$RSRC\_PDB

`V$RSRC_PDB` displays data related to currently active resource consumer groups by pluggable database (PDB).

When the `STATISTICS_LEVEL` is set to `TYPICAL` or `ALL`, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

Statistics in `V$RSRC_PDB` are reset when a multitenant container database (CDB) changes its resource plan. They are not impacted by PDB resource plan changes.

`V$RSRC_PDB` covers the same time period for all PDBs. This view is specifically designed for comparing statistics across different PDBs.

Since `V$RSRC_PDB` does not contain information at the consumer group level, it is not useful for comparing consumer groups inside a PDB.

| Column                             | Datatype                   | Description                                                                                                                                                                                                                                                                           |
|------------------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>PDB_NAME</code>              | <code>VARCHAR2 (32)</code> | PDB name                                                                                                                                                                                                                                                                              |
| <code>CPU_WAIT_TIME</code>         | <code>NUMBER</code>        | Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.                            |
| <code>CPU_WAITS</code>             | <code>NUMBER</code>        | Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |
| <code>CONSUMED_CPU_TIME</code>     | <code>NUMBER</code>        | Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)                                                                                                                                                                                        |
| <code>YIELDS</code>                | <code>NUMBER</code>        | Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.                                                                        |
| <code>IO_SERVICE_TIME</code>       | <code>NUMBER</code>        | Cumulative I/O wait time (in milliseconds)                                                                                                                                                                                                                                            |
| <code>IO_SERVICE_WAITS</code>      | <code>NUMBER</code>        | Total number of wait requests                                                                                                                                                                                                                                                         |
| <code>SMALL_READ_MEGABYTES</code>  | <code>NUMBER</code>        | Number of single block megabytes read                                                                                                                                                                                                                                                 |
| <code>SMALL_WRITE_MEGABYTES</code> | <code>NUMBER</code>        | Number of single block megabytes written                                                                                                                                                                                                                                              |
| <code>LARGE_READ_MEGABYTES</code>  | <code>NUMBER</code>        | Number of multiblock megabytes read                                                                                                                                                                                                                                                   |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| SMALL_WRITE_REQUESTS      | NUMBER   | Number of single block write requests                                                                                                                                                                                                                                                                                                                                                                                                           |
| LARGE_READ_REQUESTS       | NUMBER   | Number of multiblock read requests                                                                                                                                                                                                                                                                                                                                                                                                              |
| LARGE_WRITE_REQUESTS      | NUMBER   | Number of multiblock write requests                                                                                                                                                                                                                                                                                                                                                                                                             |
| PQS_COMPLETED             | NUMBER   | Total number of completed parallel statements in the consumer group                                                                                                                                                                                                                                                                                                                                                                             |
| PQ_SERVERS_USED           | NUMBER   | Total number of parallel servers used by completed parallel statements in the consumer group                                                                                                                                                                                                                                                                                                                                                    |
| PQS_QUEUED                | NUMBER   | Number of times that sessions in the consumer group were queued when trying to run parallel statements                                                                                                                                                                                                                                                                                                                                          |
| PQ_ACTIVE_TIME            | NUMBER   | Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)                                                                                                                                                                                                                                                                                                                       |
| PQ_QUEUED_TIME            | NUMBER   | Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)                                                                                                                                                                                                                                                                                                                   |
| PQ_QUEUE_TIME_OUTS        | NUMBER   | Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit                                                                                                                                                                                                                                                               |
| CURRENT_PQS_ACTIVE        | NUMBER   | Number of active parallel statements in the consumer group. This value does not include parallel statements that are never queued, such as GV\$ queries.                                                                                                                                                                                                                                                                                        |
| CURRENT_PQ_SERVERS_ACTIVE | NUMBER   | Number of active parallel servers in the consumer group. This value does not include servers running parallel statements that are never queued, such as GV\$ queries.                                                                                                                                                                                                                                                                           |
| CURRENT_PQS_QUEUED        | NUMBER   | Number of sessions in the consumer group that are waiting in the parallel statement queue trying to run parallel statements                                                                                                                                                                                                                                                                                                                     |
| SGA_BYTES                 | NUMBER   | The current SGA usage by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                                      |
| BUFFER_CACHE_BYTES        | NUMBER   | The current usage of buffer cache by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                          |
| SHARED_POOL_BYTES         | NUMBER   | The current usage of shared pool by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                           |
| PGA_BYTES                 | NUMBER   | The current usage of PGA by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID                    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

"V\$RSRC\_CONSUMER\_GROUP"

## 9.198 V\$RSRC\_PDB\_HISTORY

V\$RSRC\_PDB\_HISTORY displays a history of consumer group statistics for each entry in V\$RSRC\_PDB that has a non-NULL plan by pluggable database (PDB).

When the STATISTICS\_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

A new window is created in V\$RSRC\_PDB\_HISTORY when a multitenant container database (CDB) changes its resource plan. The plan windows for the CDB are not impacted by a PDB resource plan change.

V\$RSRC\_PDB\_HISTORY covers the same time period for all PDBs. This view is specifically designed for comparing statistics across different PDBs.

Since V\$RSRC\_PDB\_HISTORY does not contain information at the consumer group level, it is not useful for comparing consumer groups inside a PDB.

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                           |
|-----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEQUENCE#             | NUMBER        | A sequential counter that uniquely describes the V\$RSRC_PDB entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.                                                                                                       |
| PDB_NAME              | VARCHAR2 (32) | PBD name                                                                                                                                                                                                                                                                              |
| CPU_WAIT_TIME         | NUMBER        | Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.                            |
| CPU_WAITS             | NUMBER        | Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |
| CONSUMED_CPU_TIME     | NUMBER        | Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)                                                                                                                                                                                        |
| YIELDS                | NUMBER        | Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.                                                                        |
| IO_SERVICE_TIME       | NUMBER        | Cumulative I/O wait time (in milliseconds)                                                                                                                                                                                                                                            |
| IO_SERVICE_WAITS      | NUMBER        | Total number of wait requests                                                                                                                                                                                                                                                         |
| SMALL_READ_MEGABYTES  | NUMBER        | Number of single block megabytes read                                                                                                                                                                                                                                                 |
| SMALL_WRITE_MEGABYTES | NUMBER        | Number of single block megabytes written                                                                                                                                                                                                                                              |
| LARGE_READ_MEGABYTES  | NUMBER        | Number of multiblock megabytes read                                                                                                                                                                                                                                                   |
| LARGE_WRITE_MEGABYTES | NUMBER        | Number of multiblock megabytes written                                                                                                                                                                                                                                                |

| INSTANCE_CAGING            | VARCHAR2 (3)  | Indicates whether instance caging is enabled (ON) or disabled (OFF). Instance caging is enabled if the CPU_COUNT initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PARALLEL_SERVERS_ACTIVE    | NUMBER        | Total number of active parallel servers on the instance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PARALLEL_SERVERS_TOTAL     | NUMBER        | The value of PARALLEL_SERVERS_TARGET for the instance. Parallel statements are queued if the total number of active parallel servers exceeds this value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PARALLEL_EXECUTION_MANAGED | VARCHAR2 (32) | <p>State of parallel statement queuing:</p> <ul style="list-style-type: none"> <li>• OFF - Parallel statement queuing is disabled</li> <li>• STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes</li> <li>• FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue</li> <li>• FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (MGMT_P*) is enabled.</li> <li>• DISABLED - Parallel statement queuing is disabled. This state can occur when memory is unavailable for use by parallel statement queuing in the System Global Area (SGA). Restart the Oracle instance to re-enable parallel statement queuing.</li> </ul> <p>For an Oracle RAC database, only the instance running as primary Database Resource Manager (DBRM) shows the correct state of parallel statement queuing. All other instances default to the value FULL. A single instance database always shows the correct value for this field.</p> |
| CON_ID                     | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 9.200 V\$RSRC\_PLAN\_CPU\_MTH

V\$RSRC\_PLAN\_CPU\_MTH displays all available CPU resource allocation methods defined for resource plans.

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2 (40) | Name of the resource allocation method                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.201 V\$RSRC\_PLAN\_HISTORY

`V$RSRC_PLAN_HISTORY` displays a history of when a resource plan was enabled, disabled, or modified on the instance. Up to 15 of the most recent entries are shown. Once the database is opened, this view shows at least one row. The row with the most recent `START_TIME` and with `END_TIME` equal to `NULL` gives information about the current resource plan.

| Column                     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEQUENCE#                  | NUMBER         | A sequential counter that uniquely describes a row. When the instance is restarted, this value is reset to zero.                                                                                                                                                                                                                                                                                                                                                                                        |
| ID                         | NUMBER         | Resource plan ID; <code>NULL</code> if the Resource Manager was disabled                                                                                                                                                                                                                                                                                                                                                                                                                                |
| NAME                       | VARCHAR2 (30)  | Resource plan name; <code>NULL</code> if the Resource Manager was disabled                                                                                                                                                                                                                                                                                                                                                                                                                              |
| START_TIME                 | DATE           | Time that the resource plan was enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| END_TIME                   | DATE           | Time that the resource plan was disabled; <code>NULL</code> if the row contains the current resource plan information                                                                                                                                                                                                                                                                                                                                                                                   |
| ENABLED_BY_SCHEDULER       | VARCHAR2 (5)   | Indicates whether the plan was enabled by a Job Scheduler window ( <code>TRUE</code> ) or not ( <code>FALSE</code> )                                                                                                                                                                                                                                                                                                                                                                                    |
| WINDOW_NAME                | VARCHAR2 (128) | Job Scheduler window that triggered the resource plan event; <code>NULL</code> if a user triggered the resource plan event                                                                                                                                                                                                                                                                                                                                                                              |
| ALLOWED_AUTOMATED_SWITCHES | VARCHAR2 (5)   | Indicates whether automated plan switches were allowed after this resource plan event ( <code>TRUE</code> ) or whether automated plan switches were disabled after this resource plan event ( <code>FALSE</code> )<br><b>See Also:</b> the <code>SWITCH_PLAN</code> procedure                                                                                                                                                                                                                           |
| CPU_MANAGED                | VARCHAR2 (3)   | Indicates whether the resource plan has parameters that specify a policy for how the Resource Manager should schedule sessions to manage CPU usage ( <code>ON</code> ) or whether Resource Manager is not managing CPU usage ( <code>OFF</code> )                                                                                                                                                                                                                                                       |
| CPU_SCOPE                  | VARCHAR2 (13)  | Scope of the policy for how the Resource Manager should schedule sessions to manage CPU usage. Possible values: <ul style="list-style-type: none"> <li>• <code>OFF</code> - Resource Manager is not managing CPU usage (<code>CPU_MANAGED = OFF</code>)</li> <li>• <code>INSTANCE_ONLY</code> - Resource Manager is managing CPU usage only within the database instance</li> <li>• <code>SERVER_WIDE</code> - Resource Manager is using server-level inter-instance CPU resource management</li> </ul> |
| INSTANCE_CAGING            | VARCHAR2 (3)   | Indicates whether instance caging is enabled ( <code>ON</code> ) or disabled ( <code>OFF</code> ). Instance caging is enabled if the <code>CPU_COUNT</code> initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.                                                                                                                                                                                                                                    |

| Column                     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARALLEL_EXECUTION_MANAGED | VARCHAR2 (32) | <p>State of parallel statement queuing:</p> <ul style="list-style-type: none"> <li>• OFF - Parallel statement queuing is disabled</li> <li>• STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes</li> <li>• FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue</li> <li>• FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (MGMT_P*) is enabled.</li> <li>• DISABLED - Parallel statement queuing is disabled. This state can occur when memory is unavailable for use by parallel statement queuing in the System Global Area (SGA). Restart the Oracle instance to re-enable parallel statement queuing.</li> </ul> <p>For an Oracle RAC database, only the instance running as primary Database Resource Manager (DBRM) shows the correct state of parallel statement queuing. All other instances default to the value FULL. A single instance database always shows the correct value for this field.</p> |
| CPU_COUNT                  | NUMBER        | Value of the CPU_COUNT initialization parameter in the container to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CPU_MIN_COUNT              | NUMBER        | Value of the CPU_MIN_COUNT initialization parameter in the container to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID                     | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 9.202 V\$RSRC\_SESSION\_INFO

V\$RSRC\_SESSION\_INFO displays Resource Manager statistics per session.

| Column                    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                       | NUMBER        | Session identifier                                                                                                                                                                                                                                                                                                                                                                                                             |
| CURRENT_CONSUMER_GROUP_ID | NUMBER        | Object ID of the consumer group in which the session currently belongs; NULL if the session has not yet logged in                                                                                                                                                                                                                                                                                                              |
| CURRENT_CONSUMER_GROUP    | VARCHAR2 (32) | The name of the consumer group in which the session currently belongs                                                                                                                                                                                                                                                                                                                                                          |
| ORIG_CONSUMER_GROUP_ID    | NUMBER        | <p>Object ID of the consumer group in which the session was placed by the consumer group mappings; NULL if the session has not yet logged in</p> <p>This group may not be the current group because the SWITCH_GROUP directive in the current plan may have changed the session's current group. This group may not equal the MAPPED_CONSUMER_GROUP because the MAPPED_CONSUMER_GROUP may not be part of the current plan.</p> |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAPPING_ATTRIBUTE     | VARCHAR2 (32) | Session attribute that was used to map the session into its original consumer group; NULL if no mapping was used<br><b>See Also:</b> "DBA_RSRC_GROUP_MAPPINGS" for more details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAPPED_CONSUMER_GROUP | VARCHAR2 (32) | Consumer group to which the session was originally mapped; NULL if no mapping was used<br>This may not correspond to the original consumer group, because the mapped group may not be part of the current plan.<br><b>See Also:</b> "DBA_RSRC_GROUP_MAPPINGS" for more details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STATE                 | VARCHAR2 (32) | Current state of the session: <ul style="list-style-type: none"> <li>NOT MANAGED - Session has not logged in or the current Resource Manager plan does not require the session to be managed at this point in time</li> <li>RUNNING - Session is currently running on the CPU</li> <li>WAITING FOR CPU - Session is ready to run. It is waiting for a CPU quantum to run.</li> <li>QUEUED - Session is queued because the active session limit was reached</li> <li>IDLE - Session is idle</li> <li>IDLE BLKR - Session is idle and blocking another session</li> <li>WAITING - Session is currently in a wait<br/><b>See Also:</b> "V\$SESSION_WAIT" for the wait type</li> <li>WAITING_FOR_IO - Session is waiting to submit an I/O request</li> <li>UNBOUND - Session is not bound to any process</li> <li>EXITING - Session is about to terminate</li> </ul> |
| ACTIVE                | VARCHAR2 (5)  | Indicates whether the session is currently active (TRUE) or not (FALSE). This includes when one of the following conditions is true: <ul style="list-style-type: none"> <li>Session is in the top call</li> <li>Session has a transaction in progress</li> <li>Session is using temporary space objects</li> <li>Session holds user enqueues</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CURRENT_IDLE_TIME     | NUMBER        | Number of seconds the session has been idle (in states IDLE or IDLE BLKR) while in this consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This value is reset to zero when the session becomes active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CURRENT_CPU_WAIT_TIME | NUMBER        | Amount of time (in milliseconds) the session has waited for CPU because of resource management (in state WAIT FOR CPU) while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This does not include waits due to latch or enqueue contention, I/O waits, and so on. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CPU_WAIT_TIME         | NUMBER        | Cumulative amount of time (in milliseconds) the session has waited for CPU (in its lifetime) because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CURRENT_CPU_WAITS     | NUMBER        | Number of times the session had to wait for CPU because of resource management while in this consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This does not include waits due to latch or enqueue contention, I/O waits, and so on. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Column                        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU_WAITS                     | NUMBER   | Cumulative number of times the session had to wait for CPU (in its lifetime) because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.                                                                                                                                                                                                        |
| CURRENT_CONSUMED_CPU_TIME     | NUMBER   | Amount of CPU time (in milliseconds) consumed by the session while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.                                                                                                                                   |
| CONSUMED_CPU_TIME             | NUMBER   | Cumulative amount of CPU time consumed by the session (in its lifetime) (in milliseconds)                                                                                                                                                                                                                                                                                                                 |
| CURRENT_ACTIVE_TIME           | NUMBER   | Amount of time (in milliseconds) the session has been active while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. Active time is time spent running and waiting while executing a call. It does not include the time a session waited for CPU resources. If SWITCH_TIME_IN_CALL is used, then this is reset at the end of every call. |
| ACTIVE_TIME                   | NUMBER   | Cumulative amount of active time (in milliseconds) consumed by the session (in its lifetime)                                                                                                                                                                                                                                                                                                              |
| CURRENT_QUEUED_TIME           | NUMBER   | Amount of time (in milliseconds) the current request from the session has been queued (in state QUEUED). If the session does not have a request currently queued up, then this number will be zero.                                                                                                                                                                                                       |
| QUEUED_TIME                   | NUMBER   | Total amount of time (in milliseconds) the session has spent in the QUEUED state (in its lifetime)                                                                                                                                                                                                                                                                                                        |
| CURRENT_YIELDS                | NUMBER   | Number of times the session had to yield the CPU to other sessions (due to quantum expiration) while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. If SWITCH_TIME_IN_CALL is used, then this is reset at the end of every call.                                                                                                      |
| YIELDS                        | NUMBER   | Cumulative number of times the session had to yield CPU to other sessions due to quantum expiration (in its lifetime)                                                                                                                                                                                                                                                                                     |
| CURRENT_UNDO_CONSUMPTION      | NUMBER   | Current amount (in KB) of undo consumed by the session; NULL if the current Resource Manager plan does not have an UNDO_POOL directive                                                                                                                                                                                                                                                                    |
| MAX_UNDO_CONSUMPTION          | NUMBER   | Maximum amount of undo consumed (in KB) during the session's lifetime. This value may not be updated because the current Resource Manager plan may not have an UNDO_POOL directive.                                                                                                                                                                                                                       |
| SQL_CANCELED                  | NUMBER   | Number of times SQL queries running in the session were canceled due to exceeding the Resource Manager plan's SWITCH_TIME limit.                                                                                                                                                                                                                                                                          |
| QUEUE_TIME_OUTS               | NUMBER   | Number of times requests from the session timed out because they queued longer than the Resource Manager plan's limit                                                                                                                                                                                                                                                                                     |
| ESTIMATED_EXECUTION_LIMIT_HIT | NUMBER   | Number of times requests from the session were not run because the optimizer's estimated time to execute the query exceeded the MAX_EST_EXEC_TIME limit                                                                                                                                                                                                                                                   |
| CURRENT_IO_SERVICE_TIME       | NUMBER   | Current I/O wait time of the session (in milliseconds) for the current SQL operation                                                                                                                                                                                                                                                                                                                      |
| IO_SERVICE_TIME               | NUMBER   | Cumulative amount of I/O wait time by the session (in its lifetime) (in milliseconds)                                                                                                                                                                                                                                                                                                                     |
| CURRENT_IO_SERVICE_WAITS      | NUMBER   | Current I/O waits by session for the current SQL operation                                                                                                                                                                                                                                                                                                                                                |

| CURRENT_LARGE_READ_REQUESTS   | NUMBER   | Number of multiblock read requests by the session for the current SQL operation                                                                                                                                                                              |
| LARGE_READ_REQUESTS           | NUMBER   | Total number of multiblock read requests by the session (in its lifetime)                                                                                                                                                                                    |
| CURRENT_LARGE_WRITE_REQUESTS  | NUMBER   | Number of multiblock write requests by the session for the current SQL operation                                                                                                                                                                             |
| LARGE_WRITE_REQUESTS          | NUMBER   | Total number of multiblock write requests by the session (in its lifetime)                                                                                                                                                                                   |
| CURRENT_PQ_ACTIVE_TIME        | NUMBER   | Amount of time that the current active parallel statement has been executing for the current SQL operation, not including the amount of time that the statement has been queued (in milliseconds). If the parallel statement is queued, then the value is 0. |
| PQ_ACTIVE_TIME                | NUMBER   | Cumulative amount of time that parallel statements have been executed over the lifetime of the session (in milliseconds)                                                                                                                                     |
| DOP                           | NUMBER   | Degree of parallelism for the active or queued parallel statement, if there are any in the session                                                                                                                                                           |
| PQ_SERVERS                    | NUMBER   | The number of active parallel servers if the session is active and running the parallel query. If the query is queued, the number of parallel servers that this query is trying to run with is shown.                                                        |
| ESTIMATED_EXECUTION_TIME      | NUMBER   | Estimated execution time for the parallel statement, as estimated by the optimizer (in milliseconds). You can compare this value to <code>CURRENT_PQ_ACTIVE_TIME</code> to estimate how much longer the parallel statement will run.                         |
| CURRENT_PQ_QUEUED_TIME        | NUMBER   | Amount of time that the current parallel statement in the session has been queued (in milliseconds) for the current SQL operation. If the session does not have a queued parallel statement, then the value is 0.                                            |
| PQ_QUEUED_TIME                | NUMBER   | Total amount of time that the session has spent in the <code>PQ_QUEUED</code> state in its lifetime (in milliseconds)                                                                                                                                        |

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.203 V\$RSRCMGRMETRIC

V\$RSRCMGRMETRIC displays information about resources consumed and wait times per consumer group.

When the STATISTICS\_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources. Metrics are collected and stored every minute when CPU utilization is not being monitored.

|------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME             | DATE          | Begin time of the interval                                                                                                                                                                                                                                                      |
| END_TIME               | DATE          | End time of the interval                                                                                                                                                                                                                                                        |
| INTSIZE_CSEC           | NUMBER        | Interval size (in hundredths of a second)                                                                                                                                                                                                                                       |
| SEQUENCE#              | NUMBER        | A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.                                                                                        |
| CONSUMER_GROUP_ID      | NUMBER        | Consumer group object ID (a unique number, consistent across database shutdowns and startups)                                                                                                                                                                                   |
| CONSUMER_GROUP_NAME    | VARCHAR2 (30) | Name of the consumer group                                                                                                                                                                                                                                                      |
| CPU_CONSUMED_TIME      | NUMBER        | Cumulative amount of CPU time consumed by all sessions in the consumer group, in milliseconds                                                                                                                                                                                   |
| CPU_WAIT_TIME          | NUMBER        | Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.     |
| CPU_EXHAUSTED          | NUMBER        | Percentage of time that CPUs are exhausted, out of the total number of checks in the consumer group                                                                                                                                                                             |
| NUM_CPUS               | NUMBER        | Number of CPUs that the Resource Manager is utilizing. If instance caging is enabled, then this column is equal to the value of the CPU_COUNT initialization parameter. If instance caging is not enabled, then this column is equal to the total number of CPUs in the system. |
| RUNNING_SESSIONS_LIMIT | NUMBER        | Maximum number of sessions in the consumer group that can run simultaneously. The value of this column is NUM_CPUS multiplied by the consumer group's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.                                                     |
| AVG_RUNNING_SESSIONS   | NUMBER        | Average number of sessions in the consumer group that are currently running                                                                                                                                                                                                     |

| Column                      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVG_WAITING_SESSIONS        | NUMBER        | Average number of sessions in the consumer group that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.                                                                                                                                                                                                                                                             |
| CPU_UTILIZATION_LIMIT       | NUMBER        | Maximum percentage of CPU that the consumer group can use at any time, with respect to the total number of CPUs in the system. The value of this column is <code>RUNNING_SESSIONS_LIMIT</code> divided by the number of CPUs in the system. If instance caging is enabled, then this value is derived using the <code>CPU_COUNT</code> initialization parameter.                                                                                |
| AVG_CPU_UTILIZATION         | NUMBER        | Average percentage of CPU consumed by the consumer group, with respect to the total number of CPUs in the system                                                                                                                                                                                                                                                                                                                                |
| CPU_DECISIONS               | NUMBER        | Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.                                                                                                                                                                                                                                                                  |
| CPU_DECISIONS_EXCLUSIVE     | NUMBER        | Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.                                                                                                                                                                                                                      |
| CPU_DECISIONS_WON           | NUMBER        | Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.                                                                                                                                                                                                                                                                           |
| IO_REQUESTS                 | NUMBER        | I/O requests                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IO_MEGABYTES                | NUMBER        | I/O megabytes                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| AVG_ACTIVE_PARALLEL_STMTS   | NUMBER        | The average number of parallel statements that were running during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                                   |
| AVG_QUEUED_PARALLEL_STMTS   | NUMBER        | The average number of parallel statements that were queued during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                                    |
| AVG_ACTIVE_PARALLEL_SERVERS | NUMBER        | The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window                                                                                                                                                                                                                                                                                                             |
| AVG_QUEUED_PARALLEL_SERVERS | NUMBER        | The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window                                                                                                                                                                                                                                                                                                                      |
| PARALLEL_SERVERS_LIMIT      | NUMBER        | The number of parallel servers allowed to be used by this consumer group during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                      |
| PLAN_NAME                   | VARCHAR2 (30) | Resource Manager plan name                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID                      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.204 V\$RSRCMGRMETRIC\_HISTORY

V\$RSRCMGRMETRIC\_HISTORY displays a history (the last one hour) of resource manager metrics, taken from V\$RSRCMGRMETRIC. When a resource plan is set, this history is cleared and restarted. This view provides information about resources consumed and wait times per consumer group. The columns for V\$RSRCMGRMETRIC\_HISTORY are the same as those for V\$RSRCMGRMETRIC.

**See Also:**

## 9.205 V\$SRPCPDBMETRIC

V\$SRPCPDBMETRIC displays information about resources consumed and wait times per PDB.

When the STATISTICS\_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources. Metrics are collected and stored every minute when CPU utilization is not being monitored.

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                     |
|------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME             | DATE     | Begin time of the interval                                                                                                                                                                                                                                                      |
| END_TIME               | DATE     | End time of the interval                                                                                                                                                                                                                                                        |
| INTSIZE_CSEC           | NUMBER   | Interval size (in hundredths of a second)                                                                                                                                                                                                                                       |
| SEQUENCE#              | NUMBER   | A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these PDB statistics apply. When the instance is restarted, this value is reset to zero.                                                                                                   |
| CPU_CONSUMED_TIME      | NUMBER   | Cumulative amount of CPU time consumed by all sessions in the PDB, in milliseconds                                                                                                                                                                                              |
| CPU_WAIT_TIME          | NUMBER   | Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.     |
| CPU_EXHAUSTED          | NUMBER   | Percentage of time that CPUs are exhausted, out of the total number of checks in the PDB                                                                                                                                                                                        |
| NUM_CPUS               | NUMBER   | Number of CPUs that the Resource Manager is utilizing. If instance caging is enabled, then this column is equal to the value of the CPU_COUNT initialization parameter. If instance caging is not enabled, then this column is equal to the total number of CPUs in the system. |
| RUNNING_SESSIONS_LIMIT | NUMBER   | Maximum number of sessions in the PDB that can run simultaneously. The value of this column is NUM_CPUS multiplied by the PDB's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.                                                                           |
| AVG_RUNNING_SESSIONS   | NUMBER   | Average number of sessions in the PDB that are currently running                                                                                                                                                                                                                |
| AVG_WAITING_SESSIONS   | NUMBER   | Average number of sessions in the PDB that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.                                                                                                        |

| Column                      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU_UTILIZATION_LIMIT       | NUMBER        | Maximum percentage of CPU that the PDB can use at any time, with respect to the total number of CPUs in the system. The value of this column is <code>RUNNING_SESSIONS_LIMIT</code> divided by the number of CPUs in the system. If instance caging is enabled, then this value is derived using the <code>CPU_COUNT</code> initialization parameter.                                                                                                                    |
| AVG_CPU_UTILIZATION         | NUMBER        | Average percentage of CPU consumed by the PDB, with respect to the total number of CPUs in the system                                                                                                                                                                                                                                                                                                                                                                    |
| IOPS                        | NUMBER        | I/O operations per second during the previous minute for this PDB                                                                                                                                                                                                                                                                                                                                                                                                        |
| IOMBPS                      | NUMBER        | I/O megabytes per second during the previous minute for this PDB                                                                                                                                                                                                                                                                                                                                                                                                         |
| IOPS_THROTTLE_EXEMPT        | NUMBER        | Indicates how much of the I/O per second in the current PDB was exempted from throttling.<br><br>For example, if the value in the <code>IOPS</code> column is 20 I/Os and the value in the <code>IOPS_THROTTLE_EXEMPT</code> column is 5 I/Os, then 5 I/Os of the 20 I/Os in that second were exempted from throttling.<br><br>I/O throttling is defined by the <code>MAX_IOPS</code> database initialization parameter.                                                 |
| IOMBPS_THROTTLE_EXEMPT      | NUMBER        | Indicates how many megabytes of I/O executed per second in the current PDB were exempted from throttling.<br><br>For example, if the value in the <code>IOMBPS</code> column is 200 megabytes and the value in the <code>IOMBPS_THROTTLE_EXEMPT</code> column is 50 megabytes, then 50 megabytes of the 200 megabytes were exempt from throttling.<br><br>I/O megabytes per second throttling is defined by the <code>MAX_MBPS</code> database initialization parameter. |
| AVG_IO_THROTTLE             | NUMBER        | Average throttle time per I/O operation in milliseconds during the previous minute for this PDB                                                                                                                                                                                                                                                                                                                                                                          |
| AVG_ACTIVE_PARALLEL_STMTS   | NUMBER        | The average number of parallel statements that were running during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                                                            |
| AVG_QUEUED_PARALLEL_STMTS   | NUMBER        | The average number of parallel statements that were queued during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                                                             |
| AVG_ACTIVE_PARALLEL_SERVERS | NUMBER        | The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                      |
| AVG_QUEUED_PARALLEL_SERVERS | NUMBER        | The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                               |
| PARALLEL_SERVERS_LIMIT      | NUMBER        | The number of parallel servers allowed to be used by this PDB during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                                                          |
| SGA_BYTES                   | NUMBER        | The current SGA usage by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                                                               |
| BUFFER_CACHE_BYTES          | NUMBER        | The current usage of the buffer cache by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                                               |
| SHARED_POOL_BYTES           | NUMBER        | The current usage of the shared pool by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                                                |
| PGA_BYTES                   | NUMBER        | The current PGA usage by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                                                               |
| PLAN_NAME                   | VARCHAR2 (30) | Resource Manager plan name                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>:<br/>Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                      |

## 9.206 V\$RSRCPDBMETRIC\_HISTORY

V\$RSRCPDBMETRIC\_HISTORY displays a history (the last one hour) of resource manager metrics for a PDB, taken from V\$RSRCPDBMETRIC. When a resource plan is set, this history is cleared and restarted. This view provides information about resources consumed and wait times per consumer group.

The columns for V\$RSRCPDBMETRIC\_HISTORY are the same as those for V\$RSRCPDBMETRIC.

**See Also:**["V\\$RSRCPDBMETRIC"](#)

## 9.207 V\$RULE

V\$RULE displays rule statistics. This view has a row for every rule loaded into shared memory.

| Column                       | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RULE_SET_OBJECT_ID           | NUMBER         | Rule set object ID                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EVALUATION_CONTEXT_OBJECT_ID | NUMBER         | Evaluation context object ID                                                                                                                                                                                                                                                                                                                                                                                                                    |
| RULE_OWNER                   | VARCHAR2 (128) | Owner of the rule                                                                                                                                                                                                                                                                                                                                                                                                                               |
| RULE_NAME                    | VARCHAR2 (128) | Name of the rule                                                                                                                                                                                                                                                                                                                                                                                                                                |
| RULE_CONDITION               | VARCHAR2 (200) | Rule condition                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TRUE_HITS                    | NUMBER         | Number of times the rule evaluated to TRUE                                                                                                                                                                                                                                                                                                                                                                                                      |
| MAYBE_HITS                   | NUMBER         | Number of times the rule evaluated to MAYBE                                                                                                                                                                                                                                                                                                                                                                                                     |
| SQL_EVALUATIONS              | NUMBER         | Number of evaluations of the rule that were performed by issuing SQL                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                       | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 9.208 V\$RULE\_SET

V\$RULE\_SET displays rule set statistics. This view has a row for every rule set loaded into shared memory.

### Note:

Querying the V\$RULE\_SET view may have a negative impact on performance if a database has a large library cache.

| Column                         | Datatype       | Description                                                                                                                                                                                           |
|--------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER                          | VARCHAR2 (128) | Owner of the rule set                                                                                                                                                                                 |
| NAME                           | VARCHAR2 (128) | Name of the rule set                                                                                                                                                                                  |
| CPU_TIME                       | NUMBER         | Total CPU time (in hundredths of a second) spent in evaluation of the rule set                                                                                                                        |
| ELAPSED_TIME                   | NUMBER         | Total elapsed time (in hundredths of a second) spent in evaluation of the rule set                                                                                                                    |
| FIRST_LOAD_TIME                | DATE           | First time the current cached copy of the rule set was loaded                                                                                                                                         |
| LAST_LOAD_TIME                 | DATE           | Last time the current cached copy of the rule set was loaded                                                                                                                                          |
| LAST_LOADING_TIME              | NUMBER         | Total elapsed time (in hundredths of a second) spent to load the rule set the last time it was loaded                                                                                                 |
| SHARABLE_MEM                   | NUMBER         | Shared memory (in bytes) used by the rule set                                                                                                                                                         |
| RELOADS                        | NUMBER         | Number of times the rule set object was reloaded in shared memory                                                                                                                                     |
| INVALIDATIONS                  | NUMBER         | Number of times the rule set object was invalidated                                                                                                                                                   |
| EVALUATIONS                    | NUMBER         | Number of evaluations on the rule set                                                                                                                                                                 |
| FIRST_HIT_EVALUATIONS          | NUMBER         | Number of evaluations on the rule set, with stop_on_first_hit set to TRUE                                                                                                                             |
| SIMPLE_RULES_ONLY_EVALUATIONS  | NUMBER         | Number of evaluations on the rule set, with simple_rules_only set to TRUE                                                                                                                             |
| SQL_FREE_EVALUATIONS           | NUMBER         | Number of evaluations on the rule set which did not internally issue SQL to evaluate rules                                                                                                            |
| SQL_EXECUTIONS                 | NUMBER         | Total number of SQL statements executed during evaluation of the rule set                                                                                                                             |
| CONDITIONS_PROCESSED           | NUMBER         | Total number of fast (indexed) conditions processed during evaluation of the rule set                                                                                                                 |
| TRUE_RULES                     | NUMBER         | Total number of TRUE rules returned during evaluation of the rule set                                                                                                                                 |
| MAYBE_RULES                    | NUMBER         | Total number of MAYBE rules returned during evaluation of the rule set                                                                                                                                |
| VARIABLE_VALUE_FUNCTION_CALLS  | NUMBER         | Total number of calls made to user-defined functions to retrieve variable values (specified by the variable_value_function field in RE\$VARIABLE_TYPE) made during evaluation of the rule set         |
| VARIABLE_METHOD_FUNCTION_CALLS | NUMBER         | Total number of calls made to user-defined functions to retrieve variable method values (specified by the variable_method_function field in RE\$VARIABLE_TYPE) made during evaluation of the rule set |

| Column                    | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVALUATION_FUNCTION_CALLS | NUMBER       | Total number of calls made to user-defined evaluation functions (specified as the <code>evaluation_function</code> argument to the <code>DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT</code> procedure) made during evaluation of the rule set                                                                                                                                                                                                         |
| RESULT_CACHE_HITS         | NUMBER       | Number of result cache hits across all the sessions evaluating this rule set                                                                                                                                                                                                                                                                                                                                                                      |
| IS_RESULT_CACHE           | VARCHAR2 (3) | Indicates whether this rule set result can be cached (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                            |
| RESULT_CACHE_ELEMENTS     | NUMBER       | Number of elements cached within the result cache                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                    | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 9.209 V\$RULE\_SET\_AGGREGATE\_STATS

V\$RULE\_SET\_AGGREGATE\_STATS displays statistics aggregated over all evaluations on all rule sets. This view has a row for each type of statistic.

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Dynamic Performance (V\$) Views: V\$SCHEDULER\_IN\_MEMORY\_TRACE to V\$ZONEMAP\_USAGE\_STATS

This chapter contains the dynamic performance views V\$SCHEDULER\_IN\_MEMORY\_TRACE to V\$ZONEMAP\_USAGE\_STATS.

### 10.1 V\$SCHEDULER\_IN\_MEMORY\_TRACE

V\$SCHEDULER\_IN\_MEMORY\_TRACE displays in-memory trace and other information about all processes executing scheduler-related actions.

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID         | NUMBER         | ID of the session generating scheduler trace                                                                                                                                                                                                                                                                                                                                                                                                      |

| EXTENTS_SEALED    | NUMBER                         | Number of candidate extents selected and sealed during the shrink task                                                                                                                                                 |
| AUTOMATIC         | NUMBER                         | Indicates whether the shrink task was started automatically (1) or manually (0)                                                                                                                                        |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note:**

This view is available starting with Oracle Database 23ai.

## 10.4 V\$SECUREFILE\_TIMER

V\$SECUREFILE\_TIMER displays information about time taken (in microseconds) by functions of SecureFiles. These timer values are collected per session.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME        | VARCHAR2 (50) | Name of the function                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| OWNTIME     | NUMBER        | Total time taken by the function                                                                                                                                                                                                                                                                                                                                                                                                                       |
| MAXTIME     | NUMBER        | Maximum time taken by a single call                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MINTIME     | NUMBER        | Minimum time taken by a single call                                                                                                                                                                                                                                                                                                                                                                                                                    |
| INVOCATIONS | NUMBER        | Number of times the function was invoked                                                                                                                                                                                                                                                                                                                                                                                                               |
| LAYER_NAME  | VARCHAR2 (50) | Name of the layer to which the function belongs                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID      | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.5 V\$SEGMENT\_STATISTICS

V\$SEGMENT\_STATISTICS displays information about segment-level statistics.

| Column          | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128) | Owner of the object                                                                                                                                                                                                                                                                                                                                                                                                                         |
| OBJECT_NAME     | VARCHAR2 (128) | Name of the object                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SUBOBJECT_NAME  | VARCHAR2 (128) | Name of the subobject                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TABLESPACE_NAME | VARCHAR2 (30)  | Name of the table space to which the object belongs                                                                                                                                                                                                                                                                                                                                                                                         |
| TS#             | NUMBER         | Tablespace number                                                                                                                                                                                                                                                                                                                                                                                                                           |
| OBJ#            | NUMBER         | Dictionary object number of the object                                                                                                                                                                                                                                                                                                                                                                                                      |
| DATAOBJ#        | NUMBER         | Data object number of the object                                                                                                                                                                                                                                                                                                                                                                                                            |
| OBJECT_TYPE     | VARCHAR2 (18)  | Type of the object                                                                                                                                                                                                                                                                                                                                                                                                                          |
| STATISTIC_NAME  | VARCHAR2 (64)  | Name of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                       |
| STATISTIC#      | NUMBER         | Statistic number                                                                                                                                                                                                                                                                                                                                                                                                                            |
| VALUE           | NUMBER         | Statistic value                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID          | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.6 V\$SEGSTAT

V\$SEGSTAT displays information about segment-level statistics.

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TS#            | NUMBER        | Tablespace number                                                                                                                                                                                                                                                                                                                                                                                                                           |
| OBJ#           | NUMBER        | Dictionary object number                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 10.7 V\$SEGSTAT\_NAME

V\$SEGSTAT\_NAME displays information about segment-level statistics properties.

| Column     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTIC# | NUMBER        | Statistic number                                                                                                                                                                                                                                                                                                                                                                                                                                |
| NAME       | VARCHAR2 (64) | Name of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SAMPLED    | VARCHAR2 (3)  | Indicates whether the statistic was collected by sampling (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID     | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.8 V\$SERV\_MOD\_ACT\_STATS

V\$SERV\_MOD\_ACT\_STATS displays the same set of performance statistics as V\$SERVICE\_STATS except for a specific combination of service/module/action names.

When aggregation is enabled for the service name, module, and action name, then this view provides the timing and work done for calls issued for the business transaction.

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AGGREGATION_TYPE | VARCHAR2 (21) | Aggregation statistic type: <ul style="list-style-type: none"> <li>SERVICE_MODULE - Action value is NULL and the entry is an aggregate for all actions within a given module</li> <li>SERVICE_MODULE_ACTION - Action value is NULL only for an empty action, and the aggregation is on the level of service/module/action</li> </ul>                                                                                                            |

## 10.9 V\$SERVICE\_DRAIN\_TIMEOUT\_ADVICE

V\$SERVICE\_DRAIN\_TIMEOUT\_ADVICE displays information about connection draining.

This view allows you monitor the performance of the draining process, so you can make informed decisions about tuning the drain timeout configuration.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                     |

| MAX_WAIT          | NUMBER        | Maximum amount of time waited for the event by the service (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                          |
| TIME_WAITED_MICRO | NUMBER        | Total amount of time waited for the event by the service (in microseconds)                                                                                                                                                                                                                                                                                                                                                                      |
| CPU               | NUMBER        | Total amount of CPU time consumed by the service while implementing the wait event itself (in microseconds)                                                                                                                                                                                                                                                                                                                                     |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.11 V\$SERVICE\_REGION\_METRIC

V\$SERVICE\_REGION\_METRIC displays the metric values captured for the most recent 30-second intervals for the workload against each service region available on the database.

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME           | DATE           | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_TIME             | DATE           | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INTSIZE_CSEC         | NUMBER         | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                       |
| SERVICE_ID           | NUMBER         | Service number (internal)                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SERVICE_NETWORK_NAME | VARCHAR2 (512) | Network name for the service                                                                                                                                                                                                                                                                                                                                                                                                                    |
| REGION_NAME          | VARCHAR2 (30)  | Region name                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CALLSPERSEC          | NUMBER         | Number of user calls per second to the services                                                                                                                                                                                                                                                                                                                                                                                                 |

## 10.12 V\$SERVICE\_STATS

V\$SERVICE\_STATS displays a minimal set of performance statistics. These call rate statistics are used for making run-time routing decisions, for tracking service levels, and for per-instance diagnostics per call rate. The elapsed timing for each call provides a relative value across instances for how well a node is processing SQL calls issued under a service name. When aggregation is enabled for the Service Name, then this view provides the timing and work done for calls issued for the whole service.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_NAME_HASH | NUMBER        | Service name hash from V\$SERVICES                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 10.13 V\$SERVICE\_WAIT\_CLASS

V\$SERVICE\_WAIT\_CLASS displays aggregated wait counts and wait times for each wait statistic.

An aggregation of these wait classes is used when thresholds are imported.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_NAME      | VARCHAR2 (64) | Service name from V\$SERVICES                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SERVICE_NAME_HASH | NUMBER        | Service name hash from V\$SERVICES                                                                                                                                                                                                                                                                                                                                                                                                              |
| WAIT_CLASS_ID     | NUMBER        | Identifier of the wait class                                                                                                                                                                                                                                                                                                                                                                                                                    |
| WAIT_CLASS#       | NUMBER        | Number of the wait class                                                                                                                                                                                                                                                                                                                                                                                                                        |
| WAIT_CLASS        | VARCHAR2 (64) | Name of the wait class                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TOTAL_WAITS       | NUMBER        | Total number waits from this wait class by the service                                                                                                                                                                                                                                                                                                                                                                                          |
| TIME_WAITED       | NUMBER        | Total amount of time spent in waits from this wait class by the service (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                             |
| TIME_WAITED_MICRO | NUMBER        | Total amount of time spent in waits from this wait class by the service (in microseconds)                                                                                                                                                                                                                                                                                                                                                       |
| CPU               | NUMBER        | Total amount of CPU time consumed by the service while implementing waits from this wait class (in microseconds)                                                                                                                                                                                                                                                                                                                                |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.14 V\$SERVICEMETRIC

V\$SERVICEMETRIC displays metric values measured on the most recent time interval period for services executing inside the database. Service metrics are measured in 5-second and 1-minute intervals.

| Column            | Datatype      | Description                                                                                              |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------|
| BEGIN_TIME        | DATE          | Begin timestamp for the interval period                                                                  |
| END_TIME          | DATE          | End timestamp for the interval period                                                                    |
| INTSIZE_CSEC      | NUMBER        | Interval size (in hundredths of a second)                                                                |
| GROUP_ID          | NUMBER        | Group ID for the service metric group                                                                    |
| SERVICE_NAME_HASH | NUMBER        | Service name hash                                                                                        |
| SERVICE_NAME      | VARCHAR2 (64) | Service name                                                                                             |
| CTMHASH           | NUMBER        | Service create timestamp hash value                                                                      |
| ELAPSEDPERCALL    | NUMBER        | Elapsed time per call (in microseconds). This column is deprecated in favor of the DBTIMEPERCALL column. |
| CPUPERCALL        | NUMBER        | CPU time per call (in microseconds)                                                                      |
| DBTIMEPERCALL     | NUMBER        | Elapsed time per call (in microseconds)                                                                  |

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CALLSPERSEC  | NUMBER   | Number of user calls per second                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DBTIMEPERSEC | NUMBER   | Database time per second                                                                                                                                                                                                                                                                                                                                                                                                                        |
| GOODNESS     | NUMBER   | Indicates how attractive a given instance is with respect to processing the workload that is presented to the service. A lower number is better. This number is internally computed based on the GOAL (LONG or SHORT) that is specified for the particular service.                                                                                                                                                                             |
| DELTA        | NUMBER   | Indicates the predicted increase in the goodness for every additional session that is routed to this instance                                                                                                                                                                                                                                                                                                                                   |
| FLAGS        | NUMBER   | Flags that can be any of the following values: <ul style="list-style-type: none"> <li>0x01 - Service is BLOCKED from accepting new connections</li> <li>0x02 - Service is VIOLATING the set threshold on some metric</li> <li>0x04 - Goodness is UNKNOWN</li> </ul>                                                                                                                                                                             |
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.15 V\$SERVICEMETRIC\_HISTORY

V\$SERVICEMETRIC\_HISTORY displays a recent history of the metric values measured in predefined time interval periods for services executing inside the database. Service metrics are measured in 5-second and 1-minute intervals.

| Column            | Datatype      | Description                                                                                              |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------|
| BEGIN_TIME        | DATE          | Begin timestamp for the interval period                                                                  |
| END_TIME          | DATE          | End timestamp for the interval period                                                                    |
| INTSIZE_CSEC      | NUMBER        | Interval size (in hundredths of a second)                                                                |
| GROUP_ID          | NUMBER        | Group ID for the service metric group                                                                    |
| SERVICE_NAME_HASH | NUMBER        | Service name hash                                                                                        |
| SERVICE_NAME      | VARCHAR2 (64) | Service name                                                                                             |
| CTMHASH           | NUMBER        | Service create timestamp hash value                                                                      |
| ELAPSEDPERCALL    | NUMBER        | Elapsed time per call (in microseconds). This column is deprecated in favor of the DBTIMEPERCALL column. |
| CPUPERCALL        | NUMBER        | CPU time per call (in microseconds)                                                                      |
| DBTIMEPERCALL     | NUMBER        | Elapsed time per call (in microseconds)                                                                  |
| CALLSPERSEC       | NUMBER        | Number of user calls per second                                                                          |
| DBTIMEPERSEC      | NUMBER        | Database time per second                                                                                 |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.16 V\$SERVICES

V\$SERVICES displays information about the services in the database.

| Column             | Datatype       | Description                                                                                                                                                                                                                                                                                                                                   |
|--------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_ID         | NUMBER         | Service ID                                                                                                                                                                                                                                                                                                                                    |
| NAME               | VARCHAR2 (64)  | Name of the service                                                                                                                                                                                                                                                                                                                           |
| NAME_HASH          | NUMBER         | Service name hash                                                                                                                                                                                                                                                                                                                             |
| NETWORK_NAME       | VARCHAR2 (512) | Network name                                                                                                                                                                                                                                                                                                                                  |
| CREATION_DATE      | DATE           | Creation date                                                                                                                                                                                                                                                                                                                                 |
| CREATION_DATE_HASH | NUMBER         | Creation date hash                                                                                                                                                                                                                                                                                                                            |
| GOAL               | VARCHAR2 (12)  | <p>Runtime Load Balancing Goal being used to create run-time load balancing and connection load balancing advice:</p> <ul style="list-style-type: none"> <li>NONE</li> <li>SERVICE_TIME - Connections are balanced by response time</li> <li>THROUGHPUT - Connections are balanced by throughput</li> </ul>                                   |
| DTP                | VARCHAR2 (1)   | <p>Indicates whether or not Distributed Transaction Processing is enabled for this service. When Distributed Transaction Processing is set to Y (YES), it means that the service is offered at exactly one instance at a time for XA affinity. Possible values:</p> <ul style="list-style-type: none"> <li>Y - YES</li> <li>N - NO</li> </ul> |
| AQ_HA_NOTIFICATION | VARCHAR2 (3)   | Indicates whether FAN - Fast Application Notification for OCI connections is set (YES) or not (NO)                                                                                                                                                                                                                                            |
| CLB_GOAL           | VARCHAR2 (5)   | <p>Connection load balancing goal used with statistics that are sent to the listeners to determine how new connections are distributed:</p> <ul style="list-style-type: none"> <li>LONG - is using session count</li> <li>SHORT - is using service time or throughput</li> </ul>                                                              |

| Column                    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMIT_OUTCOME            | VARCHAR2 (3)   | <p>For Transaction Guard and Database Native Transaction Guard, indicates whether the database service associated with the user session has the COMMIT_OUTCOME service attribute enabled (YES) or not (NO). This attribute applies on a per session basis and is set at connect time.</p> <p>When the value of this column is YES, the commit status is managed for all supported transaction types and the outcome of a COMMIT transaction is preserved after the COMMIT has executed. Refer to the COMMIT_OUTCOME_FASTPATH column to view the preferred method for preserving the commit outcome.</p> <p><b>See Also:</b> <i>Oracle Database Development Guide</i> for information about preserving the commit outcome</p> |
| RETENTION_TIME            | NUMBER         | For Transaction Guard and Database Native Transaction Guard, when COMMIT_OUTCOME = YES, this value indicates the amount of time (in seconds) that the commit outcome is retained in the database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| REPLAY_INITIATION_TIMEOUT | NUMBER         | For Application Continuity, this option specifies the difference between the time (in seconds) of original execution of the first operation of a request and the time that the replay is ready to start after a successful reconnect. Application Continuity will not replay after the specified amount of time has passed. This option is intended to avoid the unintentional execution of a request when a system is recovered after a long period of time. The default is 5 minutes (300 seconds).                                                                                                                                                                                                                        |
| SESSION_STATE_CONSISTENCY | VARCHAR2 (128) | Describes how non-transactional is changed during a request. This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If non-transactional values change after the request starts, the default value of DYNAMIC should be set. Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.                                                                                                                                                                                      |
| GLOBAL                    | VARCHAR2 (3)   | <p>Indicates whether the service is global. A global service is managed by Global Service Manager (GSM) and can be provided by multiple databases that contain replicated data. Possible values:</p> <ul style="list-style-type: none"> <li>• YES: Indicates the service is global</li> <li>• NO: Indicates the service is not global</li> </ul>                                                                                                                                                                                                                                                                                                                                                                             |
| PDB                       | VARCHAR2 (128) | Name of a pluggable database (PDB) associated with a given service. Will contain NULL if a database is a non-CDB or if the service is not associated with a PDB (that is, connecting to a CDB using this service will cause a user to connect to the root.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SQL_TRANSLATION_PROFILE   | VARCHAR2 (261) | A non-NULL value specifies the initial SQL translation profile for subsequent database connections that use the service and do not specify a SQL translation profile. A NULL value has no effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| MAX_LAG_TIME              | VARCHAR2 (128) | The maximum replication lag (in seconds) that is acceptable for a data replica to be used for providing the database service. Can only be specified for global services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| STOP_OPTION               | VARCHAR2 (128) | Stop option for sessions of this service for planned maintenance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FAILOVER_RESTORE          | VARCHAR2 (128) | Indicates whether sessions recover their commonly used session state (like NLS, schema) when they are failed over with TAF                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DRAIN_TIMEOUT             | NUMBER         | Number of seconds to wait for sessions to be drained                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| TABLE_FAMILY_ID           | NUMBER         | Sharded table family ID associated with the service                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PLACEMENT_TEMPLATE        | VARCHAR2 (64)  | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMIT_OUTCOME_FASTPATH | VARCHAR2 (3)  | <p>For Transaction Guard and Database Native Transaction Guard, when COMMIT_OUTCOME = YES, the value of this column indicates the preferred method for preserving the commit outcome. Possible values:</p> <ul style="list-style-type: none"> <li>YES - Database Native Transaction Guard is used. Each transaction is assigned a unique transaction identifier (DB XID) in the database. The DB XID and status of the corresponding transaction are maintained persistently in a transaction table. Note that if COMMIT_OUTCOME = YES, then the value of COMMIT_OUTCOME_FASTPATH defaults to YES.</li> <li>NO - Transaction Guard is used. A logical transaction ID (LTXID) is set for each user session at login and at each successful commit. LTXIDs are used only when the commit is not in the same round-trip to the database as the start of the transaction. Moreover, some transaction types, such as commit on success transactions, DDL transactions, and PL/SQL transactions, will continue to use LTXIDs in the same round-trip. When Transaction Guard is used, the outcome of a COMMIT transaction is known. If there is an outage, the application can use DBMS_APP_CONT.GET_LTXID_OUTCOME to return a reliable status for the last in-flight work.</li> </ul> <p><b>See Also:</b> <i>Oracle Real Application Clusters Administration and Deployment Guide</i> for information about logical transaction IDs</p> |
| TRUE_CACHE_SERVICE      | VARCHAR2 (64) | True Cache service associated with this database service                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID                  | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 10.17 V\$SES\_OPTIMIZER\_ENV

V\$SES\_OPTIMIZER\_ENV displays the contents of the optimizer environment used by each session. When a new session is first created, it automatically inherits its optimizer environment from the optimizer environment defined at the instance level by V\$SYS\_OPTIMIZER\_ENV. The value of certain parameters can be dynamically modified by issuing an ALTER SESSION statement.

| Column      | Datatype      | Description                                                                            |
|-------------|---------------|----------------------------------------------------------------------------------------|
| SID         | NUMBER        | Session identifier. This column can be used to join with V\$SESSION on the SID column. |
| ID          | NUMBER        | Unique identifier of the parameter in the optimizer environment                        |
| NAME        | VARCHAR2 (40) | Name of the parameter                                                                  |
| SQL_FEATURE | VARCHAR2 (64) | Associated feature control ID                                                          |
| ISDEFAULT   | VARCHAR2 (3)  | Indicates whether the parameter is set to the default value (YES) or not (NO)          |
| VALUE       | VARCHAR2 (25) | Value of the parameter for the session                                                 |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| CONSISTENT_GETS          | NUMBER   | Consistent gets for this session                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PHYSICAL_READS           | NUMBER   | Physical reads for this session                                                                                                                                                                                                                                                                                                                                                                                                                        |
| BLOCK_CHANGES            | NUMBER   | Block changes for this session                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CONSISTENT_CHANGES       | NUMBER   | Consistent changes for this session                                                                                                                                                                                                                                                                                                                                                                                                                    |
| OPTIMIZED_PHYSICAL_READS | NUMBER   | Number of physical reads from Database Smart Flash Cache for this session                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID                   | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.19 V\$SESS\_TIME\_MODEL

V\$SESS\_TIME\_MODEL displays the session-accumulated time for various operations. The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.

The time values are 8-byte integers and can therefore hold approximately 580,000 years of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID       | NUMBER        | Session ID (same as in V\$SESSION)                                                                                                                                                                                                                                                                                                                                                                                                              |
| STAT_ID   | NUMBER        | Statistic identifier for the time statistic                                                                                                                                                                                                                                                                                                                                                                                                     |
| STAT_NAME | VARCHAR2 (64) | Name of the statistic (see <a href="#">Table 10-1</a> )                                                                                                                                                                                                                                                                                                                                                                                         |
| VALUE     | NUMBER        | Amount of time (in microseconds) that the session has spent in this operation                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Table 10-1 V\$SESS\_TIME\_MODEL and V\$SYS\_TIME\_MODEL Statistics**

| Statistic Name                                   | Description                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB time                                          | Amount of elapsed time (in microseconds) spent performing Database user-level calls. This does not include the elapsed time spent on instance background processes such as PMON.                                                                                                                                                             |
| DB CPU                                           | Amount of CPU time (in microseconds) spent on database user-level calls. This does not include the CPU time spent on instance background processes such as PMON.                                                                                                                                                                             |
| background elapsed time                          | Amount of elapsed time (in microseconds) consumed by database background processes.                                                                                                                                                                                                                                                          |
| background CPU time                              | Amount of CPU time (in microseconds) consumed by database background processes.                                                                                                                                                                                                                                                              |
| sequence load elapsed time                       | Amount of elapsed time spent getting the next sequence number from the data dictionary. If a sequence is cached, then this is the amount of time spent replenishing the cache when it runs out. No time is charged when a sequence number is found in the cache. For non-cached sequences, some time will be charged for every nextval call. |
| parse time elapsed                               | Amount of elapsed time spent parsing SQL statements. It includes both soft and hard parse time.                                                                                                                                                                                                                                              |
| hard parse elapsed time                          | Amount of elapsed time spent hard parsing SQL statements.                                                                                                                                                                                                                                                                                    |
| SQL execute elapsed time                         | Amount of elapsed time SQL statements are executing. Note that for select statements this also includes the amount of time spent performing fetches of query results.                                                                                                                                                                        |
| connection management call elapsed time          | Amount of elapsed time spent performing session connect and disconnect calls.                                                                                                                                                                                                                                                                |
| failed parse elapsed time                        | Amount of time spent performing SQL parses which ultimately fail with some parse error.                                                                                                                                                                                                                                                      |
| failed parse (out of shared memory) elapsed time | Amount of time spent performing SQL parses which ultimately fail with error ORA-04031.                                                                                                                                                                                                                                                       |
| hard parse (sharing criteria) elapsed time       | Amount of elapsed time spent performing SQL hard parses when the hard parse resulted from not being able to share an existing cursor in the SQL cache.                                                                                                                                                                                       |
| hard parse (bind mismatch) elapsed time          | Amount of elapsed time spent performing SQL hard parses when the hard parse resulted from bind type or bind size mismatch with an existing cursor in the SQL cache.                                                                                                                                                                          |

**Table 10-1 (Cont.) V\$SESS\_TIME\_MODEL and V\$SYS\_TIME\_MODEL Statistics**

| Statistic Name                  | Description                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PL/SQL execution elapsed time   | Amount of elapsed time spent running the PL/SQL interpreter. This does not include time spent recursively executing/parsing SQL statements or time spent recursively executing the Java VM.             |
| PL/SQL compilation elapsed time | Amount of elapsed time spent running the PL/SQL compiler.                                                                                                                                               |
| inbound PL/SQL rpc elapsed time | Time inbound PL/SQL remote procedure calls have spent executing. It includes all time spent recursively executing SQL and JAVA, and therefore is not easily related to "PL/SQL execution elapsed time". |
| Java execution elapsed time     | Amount of elapsed time spent running the Java VM. This does not include time spent recursively executing/parsing SQL statements or time spent recursively executing PL/SQL.                             |
| RMAN cpu time (backup/restore)  | Amount of CPU time (in microseconds) spent in RMAN backup and restore operations.                                                                                                                       |
| repeated bind elapsed time      | Amount of elapsed time spent giving new values to bind variables (rebinding).                                                                                                                           |
| OLAP engine elapsed time        | Amount of time spent performing OLAP session transactions. This includes time spent on database user-level calls, SQL statement execution, and PL/SQL execution within the OLAP transaction.            |
| OLAP engine CPU time            | Amount of CPU time spent on OLAP session transactions. This includes time spent on database user-level calls, SQL statement execution, and PL/SQL execution within the OLAP transaction.                |

The relationships between the statistics listed in [Table 10-1](#) form two trees in which all the time reported by a child in the tree is contained within the parent in the tree. The following are the relationship trees; the number is the level in the given tree.

```

1) background elapsed time
 2) background cpu time
 3) RMAN cpu time (backup/restore)
1) DB time
 2) DB CPU
 2) connection management call elapsed time
 2) sequence load elapsed time
 2) sql execute elapsed time
 2) parse time elapsed
 3) hard parse elapsed time
 4) hard parse (sharing criteria) elapsed time
 5) hard parse (bind mismatch) elapsed time
 3) failed parse elapsed time
 4) failed parse (out of shared memory) elapsed time
 2) PL/SQL execution elapsed time
 2) inbound PL/SQL rpc elapsed time
 2) PL/SQL compilation elapsed time
 2) Java execution elapsed time
 2) repeated bind elapsed time

```

The relationship between a parent and a child in the tree indicates containment only. Keep the following in mind regarding the tree:

- Children do not necessarily add up to the parent.
- Children are not necessarily exclusive (that is, they may overlap).
- The union of children does not necessarily cover the whole of the parent.

## 10.20 V\$SESSION

V\$SESSION displays session information for each current session.

| Column   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                            |
|----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SADDR    | RAW(4   8)    | Session address                                                                                                                                                                                                                                                                                                                                        |
| SID      | NUMBER        | Session identifier                                                                                                                                                                                                                                                                                                                                     |
| SERIAL#  | NUMBER        | Session serial number. Used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID.                                                                                                                       |
| AUDSID   | NUMBER        | Auditing session ID <ul style="list-style-type: none"> <li>If the database is configured for unified auditing, then this column displays the unified auditing session ID</li> <li>If the database is configured for mixed mode auditing, then this column displays the traditional auditing session ID</li> </ul>                                      |
| PADDR    | RAW(4   8)    | Address of the process that owns the session                                                                                                                                                                                                                                                                                                           |
| USER#    | NUMBER        | Oracle user identifier                                                                                                                                                                                                                                                                                                                                 |
| USERNAME | VARCHAR2(128) | Oracle username                                                                                                                                                                                                                                                                                                                                        |
| COMMAND  | NUMBER        | Command in progress (last statement parsed).<br>You can find the command name for any value <i>n</i> returned in this <b>COMMAND</b> column by running this SQL query:<br><br><pre>SELECT command_name   FROM v\$sqlcommand  WHERE command_type = n;</pre> A value of 0 in this <b>COMMAND</b> column means the command is not recorded in V\$SESSION. |
| OWNERID  | NUMBER        | Identifier of the user who owns the migratable session; the column contents are invalid if the value is 2147483644<br><br>For operations using parallel worker processes, interpret this value as a 4-byte value. The low-order 2 bytes represent the session number and the high-order bytes represent the instance ID of the query coordinator.      |
| TADDR    | VARCHAR2(16)  | Address of the transaction state object                                                                                                                                                                                                                                                                                                                |
| LOCKWAIT | VARCHAR2(16)  | Address of the lock the session is waiting for; NULL if none                                                                                                                                                                                                                                                                                           |

| Column                    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                    | VARCHAR2 (8)   | Status of the session: <ul style="list-style-type: none"> <li>ACTIVE - Session currently executing SQL</li> <li>INACTIVE - Session which is inactive and either has no configured limits or has not yet exceeded the configured limits</li> <li>KILLED - Session marked to be terminated</li> <li>CACHED - Session temporarily cached for use by Oracle*XA</li> <li>SNIPED - An inactive session that has exceeded some configured limits (for example, resource limits specified for the resource manager consumer group or idle_time specified in the user's profile). Such sessions will not be allowed to become active again.</li> </ul> |

| CLIENT_INFO          | VARCHAR2 (64) | Information set by the DBMS_APPLICATION_INFO.SET_CLIENT_INFO procedure                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FIXED_TABLE_SEQUENCE | NUMBER        | This contains a number that increases every time the session completes a call to the database and there has been an intervening select from a dynamic performance table. This column can be used by performance monitors to monitor statistics in the database. Each time the performance monitor looks at the database, it only needs to look at sessions that are currently active or have a higher value in this column than the highest value that the performance monitor saw the last time. All the other sessions have been idle since the last time the performance monitor looked at the database. |
| ROW_WAIT_OBJ#        | NUMBER        | Object ID for the table containing the row specified in ROW_WAIT_ROW#                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ROW_WAIT_FILE#       | NUMBER        | Identifier for the data file containing the row specified in ROW_WAIT_ROW#. This column is valid only if the session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.                                                                                                                                                                                                                                                                                                                                                                                       |
| ROW_WAIT_BLOCK#      | NUMBER        | Identifier for the block containing the row specified in ROW_WAIT_ROW#. This column is valid only if the session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.                                                                                                                                                                                                                                                                                                                                                                                           |
| ROW_WAIT_ROW#        | NUMBER        | Current row being locked. This column is valid only if the session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 10.21 V\$SESSION\_BLOCKERS

V\$SESSION\_BLOCKERS displays the blocker sessions for each blocked session. Each row represents a blocked and blocker session pair. If a session is blocked by multiple sessions there will be multiple rows for that blocked session. The maximum number of blocker sessions displayed for a single blocked session is 30. If a session is not blocked by other sessions, then there will be no row in this view for that session.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.22 V\$SESSION\_CONNECT\_INFO

V\$SESSION\_CONNECT\_INFO displays information about network connections for all currently logged in sessions.

| Column | Datatype | Description                                                        |
|--------|----------|--------------------------------------------------------------------|
| SID    | NUMBER   | Session identifier (can be used to join this view with V\$SESSION) |

| Column                   | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERIAL#                  | NUMBER          | Session serial number. Used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID. (Can be used to join this view with V\$SESSION.)                                                                                                                                                                             |
| AUTHENTICATION_TYPE      | VARCHAR2 (26)   | How the user was authenticated: <ul style="list-style-type: none"> <li>DATABASE - Username/password authentication</li> <li>OS - Operating system external user authentication</li> <li>NETWORK - Network protocol or ANO authentication</li> <li>PROXY - OCI proxy connection authentication</li> <li>SERVER</li> <li>PASSWORD</li> <li>EXTERNAL ADAPTERS</li> <li>INTERNAL</li> <li>GLOBAL</li> <li>EXTERNAL</li> <li>PASSWORD BASED GLOBAL USER</li> </ul> |
| OSUSER                   | VARCHAR2 (128)  | External username for this database user                                                                                                                                                                                                                                                                                                                                                                                                                      |
| NETWORK_SERVICE_BANNER   | VARCHAR2 (4000) | Product banners for each Oracle Net service used for this connection (one row per banner)                                                                                                                                                                                                                                                                                                                                                                     |
| CLIENT_CHARSET           | VARCHAR2 (40)   | Client character set as specified in the NLS_LANG environment variable or in the OCIEnvNlsCreate() call; Unknown if the Oracle client is older than release 11.1 or the connection is through the JDBC thin driver                                                                                                                                                                                                                                            |
| CLIENT_CONNECTION        | VARCHAR2 (13)   | Client server connection flags: <ul style="list-style-type: none"> <li>Heterogeneous</li> <li>Homogeneous</li> </ul>                                                                                                                                                                                                                                                                                                                                          |
| CLIENT_OCI_LIBRARY       | VARCHAR2 (27)   | OCI client library: <ul style="list-style-type: none"> <li>Home-based</li> <li>Full Instant Client</li> <li>Light Weight Instant Client</li> <li>OCI</li> <li>Unknown</li> </ul>                                                                                                                                                                                                                                                                              |
| CLIENT_VERSION           | VARCHAR2 (40)   | Client library version number                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CLIENT_DRIVER            | VARCHAR2 (30)   | Client driver name                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CLIENT_LOBATTR           | VARCHAR2 (23)   | Client LOB flags: <ul style="list-style-type: none"> <li>Client Temp Lob Rfc On</li> <li>Client Temp Lob Rfc Off</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| CLIENT_REGID             | NUMBER          | Query cache registration ID sent by the client                                                                                                                                                                                                                                                                                                                                                                                                                |
| CLIENT_CONNECTION_STRING | VARCHAR2 (4000) | Connection string used to establish the connection                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                   | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                             |

## 10.23 V\$SESSION\_CURSOR\_CACHE

V\$SESSION\_CURSOR\_CACHE displays information on cursor usage for the current session.

 **Note:**  
The V\$SESSION\_CURSOR\_CACHE view is not a measure of the effectiveness of the SESSION\_CACHED\_CURSORS initialization parameter.

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAXIMUM   | NUMBER   | Maximum number of cursors to cache. Once you hit this number, some cursors will need to be closed in order to open more. The value in this column is derived from the initialization parameter SESSION_CACHED_CURSORS.                                                                                                                                                                                                                          |
| COUNT     | NUMBER   | Current number of cursors (whether they are in use or not)                                                                                                                                                                                                                                                                                                                                                                                      |
| OPENS     | NUMBER   | Cumulative total of cursor opens minus one. This is because the cursor that is currently open and being used for this query is not counted in the OPENS statistic.                                                                                                                                                                                                                                                                              |
| HITS      | NUMBER   | Cumulative total of cursor open hits                                                                                                                                                                                                                                                                                                                                                                                                            |
| HIT_RATIO | NUMBER   | Ratio of the number of times an open cursor was found divided by the number of times a cursor was sought                                                                                                                                                                                                                                                                                                                                        |
| CON_ID    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.24 V\$SESSION\_EVENT

V\$SESSION\_EVENT displays information on waits for an event by a session. Note that the TIME\_WAITED and AVERAGE\_WAIT columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you

want this column to reflect true wait times, then you must set `TIMED_STATISTICS` to `true` in the parameter file; doing this will have a small negative effect on system performance.

| TIME_WAITED_MICRO | NUMBER        | Total amount of time waited for the event by the session (in microseconds)                                                                                                                                                                                                                                                                                                                                                                      |
| CPU               | NUMBER        | Total amount of CPU time consumed by the session while implementing the wait event itself (in microseconds)                                                                                                                                                                                                                                                                                                                                     |
| EVENT_ID          | NUMBER        | Identifier of the wait event                                                                                                                                                                                                                                                                                                                                                                                                                    |
| WAIT_CLASS_ID     | NUMBER        | Identifier of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                  |
| WAIT_CLASS#       | NUMBER        | Number of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                      |
| WAIT_CLASS        | VARCHAR2 (64) | Name of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.25 V\$SESSION\_FIX\_CONTROL

`V$SESSION_FIX_CONTROL` displays information about Fix Control (enabled/disabled) for the current session.

| Column      | Datatype      | Description                                                                      |
|-------------|---------------|----------------------------------------------------------------------------------|
| SESSION_ID  | NUMBER        | Session identifier (can be used to join this view with <code>V\$SESSION</code> ) |
| BUGNO       | NUMBER        | Bug number (as fix control identifier)                                           |
| VALUE       | NUMBER        | Current value set for the fix control                                            |
| SQL_FEATURE | VARCHAR2 (64) | Feature control ID                                                               |

| Column                   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DESCRIPTION              | VARCHAR2 (64) | Description of the fix control                                                                                                                                                                                                                                                                                                                                                                                                                  |
| OPTIMIZER_FEATURE_ENABLE | VARCHAR2 (25) | Version on (and after) which the fix is enabled by default                                                                                                                                                                                                                                                                                                                                                                                      |
| EVENT                    | NUMBER        | Event formerly used to control the fix                                                                                                                                                                                                                                                                                                                                                                                                          |
| IS_DEFAULT               | NUMBER        | Indicates whether the current value is the same as the default (1) or not (0)                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID                   | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.26 V\$SESSION\_LONGOPS

V\$SESSION\_LONGOPS displays the status of various operations that run for longer than 6 seconds (in absolute time). These operations currently include many backup and recovery functions, statistics gathering, and query execution, and more operations are added for every Oracle release.

To monitor query execution progress, you must be using the cost-based optimizer and you must:

- Set the `TIMED_STATISTICS` or `SQL_TRACE` parameters to `true`
- Gather statistics for your objects with the `DBMS_STATS` package

You can add information to this view about application-specific long-running operations by using the `DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS` procedure.

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID              | NUMBER        | Identifier of the session processing the long-running operation. If multiple sessions are cooperating in the long-running operation, then <code>SID</code> corresponds to the main session.                                                                                                                                                                                                                                          |
| SERIAL#          | NUMBER        | Serial number of the session processing the long-running operation. If multiple sessions are cooperating in the long-running operation, then <code>SERIAL#</code> corresponds to the main session. <code>SERIAL#</code> is used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID. |
| OPNAME           | VARCHAR2 (64) | Brief description of the operation                                                                                                                                                                                                                                                                                                                                                                                                   |
| TARGET           | VARCHAR2 (64) | Object on which the operation is carried out                                                                                                                                                                                                                                                                                                                                                                                         |
| TARGET_DESC      | VARCHAR2 (32) | Description of the target                                                                                                                                                                                                                                                                                                                                                                                                            |
| SOFAR            | NUMBER        | Units of work done so far for the operation specified in the <code>OPNAME</code> column                                                                                                                                                                                                                                                                                                                                              |
| TOTALWORK        | NUMBER        | Total units of work for the operation specified in the <code>OPNAME</code> column                                                                                                                                                                                                                                                                                                                                                    |
| UNITS            | VARCHAR2 (32) | Units of measurement                                                                                                                                                                                                                                                                                                                                                                                                                 |
| START_TIME       | DATE          | Starting time of the operation                                                                                                                                                                                                                                                                                                                                                                                                       |
| LAST_UPDATE_TIME | DATE          | Time when statistics were last updated for the operation                                                                                                                                                                                                                                                                                                                                                                             |

| Column              | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIMESTAMP           | DATE           | Timestamp specific to the operation                                                                                                                                                                                                                                                                                                                                                                                                             |
| TIME_REMAINING      | NUMBER         | Estimate (in seconds) of time remaining for the operation to complete                                                                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_SECONDS     | NUMBER         | Number of elapsed seconds from the start of the operations                                                                                                                                                                                                                                                                                                                                                                                      |
| CONTEXT             | NUMBER         | Context                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| MESSAGE             | VARCHAR2 (512) | Statistics summary message                                                                                                                                                                                                                                                                                                                                                                                                                      |
| USERNAME            | VARCHAR2 (30)  | User ID of the user performing the operation                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_ADDRESS         | RAW (4   8)    | Used with the value of the <code>SQL_HASH_VALUE</code> column to identify the SQL statement associated with the operation                                                                                                                                                                                                                                                                                                                       |
| SQL_HASH_VALUE      | NUMBER         | Used with the value of the <code>SQL_ADDRESS</code> column to identify the SQL statement associated with the operation                                                                                                                                                                                                                                                                                                                          |
| SQL_ID              | VARCHAR2 (13)  | SQL identifier of the SQL statement associated with the long operation, if any                                                                                                                                                                                                                                                                                                                                                                  |
| SQL_PLAN_HASH_VALUE | NUMBER         | SQL plan hash value; NULL if <code>SQL_ID</code> is NULL                                                                                                                                                                                                                                                                                                                                                                                        |
| SQL_EXEC_START      | DATE           | Time when the execution of the SQL started; NULL if <code>SQL_ID</code> is NULL                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_EXEC_ID         | NUMBER         | SQL execution identifier (see <code>V\$SQL_MONITOR</code> )                                                                                                                                                                                                                                                                                                                                                                                     |
| SQL_PLAN_LINE_ID    | NUMBER         | SQL plan line ID corresponding to the long operation; NULL if the long operation is not associated with a line of the execution plan                                                                                                                                                                                                                                                                                                            |
| SQL_PLAN_OPERATION  | VARCHAR2 (30)  | Plan operation name; NULL if <code>SQL_PLAN_LINE_ID</code> is NULL                                                                                                                                                                                                                                                                                                                                                                              |
| SQL_PLAN_OPTIONS    | VARCHAR2 (30)  | Plan operation options; NULL if <code>SQL_PLAN_LINE_ID</code> is NULL                                                                                                                                                                                                                                                                                                                                                                           |
| QCSID               | NUMBER         | Session identifier of the parallel coordinator                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID              | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.27 V\$SESSION\_OBJECT\_CACHE

`V$SESSION_OBJECT_CACHE` displays object cache statistics for the current user session on the local server (instance).

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PINS             | NUMBER   | Number of object pins or look-ups in the cache                                                                                                                                                                                                                                                                                                                                                                                                        |
| HITS             | NUMBER   | Number of object pins that found the object already in the cache                                                                                                                                                                                                                                                                                                                                                                                      |
| TRUE_HITS        | NUMBER   | Number of object pins that found the object already in the cache and in the desired state (thus, not requiring refresh from the database)                                                                                                                                                                                                                                                                                                             |
| HIT_RATIO        | NUMBER   | Ratio of HITS / PINS                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TRUE_HIT_RATIO   | NUMBER   | Ratio of TRUE_HITS/PINS                                                                                                                                                                                                                                                                                                                                                                                                                               |
| OBJECT_REFRESHES | NUMBER   | Number of objects in the cache that were refreshed with a new value from the database                                                                                                                                                                                                                                                                                                                                                                 |
| CACHE_REFRESHES  | NUMBER   | Number of times the whole cache (all objects) were refreshed                                                                                                                                                                                                                                                                                                                                                                                          |
| OBJECT_FLUSHES   | NUMBER   | Number of objects in the cache that were flushed to the database                                                                                                                                                                                                                                                                                                                                                                                      |
| CACHE_FLUSHES    | NUMBER   | Number of times the whole cache (all objects) were flushed to the database                                                                                                                                                                                                                                                                                                                                                                            |
| CACHE_SHRINKS    | NUMBER   | Number of times the cache was shrunk to the optimal size                                                                                                                                                                                                                                                                                                                                                                                              |
| CACHED_OBJECTS   | NUMBER   | Number of objects currently cached                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PINNED_OBJECTS   | NUMBER   | Number of objects currently pinned                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CACHE_SIZE       | NUMBER   | Current size of the cache (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                  |
| OPTIMAL_SIZE     | NUMBER   | Optimal size of the cache (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAXIMUM_SIZE     | NUMBER   | Maximum size of the cache (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.28 V\$SESSION\_WAIT

V\$SESSION\_WAIT displays the current or last wait for each session.

| Column | Datatype      | Description                                                                                                                                                                                                                                        |
|--------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID    | NUMBER        | Session identifier; maps to V\$SESSION.SID                                                                                                                                                                                                         |
| SEQ#   | NUMBER        | A number that uniquely identifies the current or last wait (incremented for each wait)                                                                                                                                                             |
| EVENT  | VARCHAR2 (64) | If the session is currently waiting, then the resource or event for which the session is waiting. If the session is not in a wait, then the resource or event for which the session most recently waited.<br><b>See Also:</b> "Oracle Wait Events" |
| P1TEXT | VARCHAR2 (64) | Description of the first wait event parameter                                                                                                                                                                                                      |
| P1     | NUMBER        | First wait event parameter (in decimal)                                                                                                                                                                                                            |
| P1RAW  | RAW (8)       | First wait event parameter (in hexadecimal) <sup>1</sup>                                                                                                                                                                                           |
| P2TEXT | VARCHAR2 (64) | Description of the second wait event parameter                                                                                                                                                                                                     |
| P2     | NUMBER        | Second wait event parameter (in decimal)                                                                                                                                                                                                           |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| WAIT_TIME_MICRO            | NUMBER        | Amount of time waited (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                         |
| TIME_SINCE_LAST_WAIT_MICRO | NUMBER        | Time elapsed (in microseconds) since the end of the previous wait in the wait history                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID                     | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.31 V\$SESSIONS\_COUNT

V\$SESSIONS\_COUNT displays the current number of sessions for each PDB.

| Column                  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| USER_SESSION_COUNT      | NUMBER   | Displays the current number of user sessions for the PDB                                                                                                                                                                                                                                                                                                                                                                                        |
| RECURSIVE_SESSION_COUNT | NUMBER   | Displays the current number of recursive sessions for the PDB                                                                                                                                                                                                                                                                                                                                                                                   |

## 10.32 V\$SESSMETRIC

V\$SESSMETRIC displays the metric values for all sessions.

| Column             | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME         | DATE     | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                  |
| END_TIME           | DATE     | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                    |
| INTSIZE_CSEC       | NUMBER   | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                   |
| SESSION_ID         | NUMBER   | Session ID                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SESSION_SERIAL_NUM | NUMBER   | Session serial number                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CPU                | NUMBER   | CPU usage                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PHYSICAL_READS     | NUMBER   | Number of physical reads                                                                                                                                                                                                                                                                                                                                                                                                                    |
| LOGICAL_READS      | NUMBER   | Number of logical reads                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PGA_MEMORY         | NUMBER   | PGA size at the end of the interval                                                                                                                                                                                                                                                                                                                                                                                                         |
| HARD_PARSSES       | NUMBER   | Number of hard parses                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SOFT_PARSSES       | NUMBER   | Number of soft parses                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PHYSICAL_READ_PCT  | NUMBER   | Physical read ratio                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LOGICAL_READ_PCT   | NUMBER   | Logical read ratio                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID             | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.33 V\$SESSTAT

V\$SESSTAT displays user session statistics. To find the name of the statistic associated with each statistic number (STATISTIC#), query the V\$STATNAME view.

| Column     | Datatype | Description                                                                                                                                                                                                           |
|------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID        | NUMBER   | Session identifier                                                                                                                                                                                                    |
| STATISTIC# | NUMBER   | Statistic number<br><b>Note:</b> Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications. |
| VALUE      | NUMBER   | Statistic value                                                                                                                                                                                                       |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 10.34 V\$SGA

V\$SGA displays summary information about the system global area (SGA).

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2 (20) | SGA component group                                                                                                                                                                                                                                                                                                                                                                                                                             |
| VALUE  | NUMBER        | Memory size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.35 V\$SGA\_CURRENT\_RESIZE\_OPS

V\$SGA\_CURRENT\_RESIZE\_OPS displays information about SGA resize operations which are currently in progress. An operation can be a grow or a shrink of a dynamic SGA component. All sizes are expressed in bytes.

| Column    | Datatype      | Description                                                                                                                                                           |
|-----------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT | VARCHAR2 (64) | Component name                                                                                                                                                        |
| OPER_TYPE | VARCHAR2 (13) | Operation type: <ul style="list-style-type: none"> <li>STATIC</li> <li>INITIALIZING</li> <li>DISABLED</li> <li>GROW</li> <li>SHRINK</li> <li>SHRINK_CANCEL</li> </ul> |

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPER_MODE        | VARCHAR2 (9)  | Operation mode: <ul style="list-style-type: none"> <li>MANUAL</li> <li>DEFERRED</li> <li>IMMEDIATE</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| PARAMETER        | VARCHAR2 (80) | Name of the parameter for the resize operation                                                                                                                                                                                                                                                                                                                                                                                                  |
| INITIAL_SIZE     | NUMBER        | Parameter value at the start of the operation                                                                                                                                                                                                                                                                                                                                                                                                   |
| TARGET_SIZE      | NUMBER        | Desired value of the parameter after the resize                                                                                                                                                                                                                                                                                                                                                                                                 |
| CURRENT_SIZE     | NUMBER        | Current value of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                  |
| START_TIME       | DATE          | Start time of the operation                                                                                                                                                                                                                                                                                                                                                                                                                     |
| LAST_UPDATE_TIME | DATE          | Last time progress was made for the operation                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.36 V\$SGA\_DYNAMIC\_COMPONENTS

V\$SGA\_DYNAMIC\_COMPONENTS displays information about the dynamic SGA components. This view summarizes information based on all completed SGA resize operations since instance startup. All sizes are expressed in bytes.

| Column              | Datatype      | Description                                                                                                                                                                                       |
|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT           | VARCHAR2 (64) | Component name                                                                                                                                                                                    |
| CURRENT_SIZE        | NUMBER        | Current size of the component                                                                                                                                                                     |
| MIN_SIZE            | NUMBER        | Minimum size of the component since instance startup                                                                                                                                              |
| MAX_SIZE            | NUMBER        | Maximum size of the component since instance startup                                                                                                                                              |
| USER_SPECIFIED_SIZE | NUMBER        | Value of the user parameter for the component                                                                                                                                                     |
| OPER_COUNT          | NUMBER        | Number of operations since instance startup                                                                                                                                                       |
| LAST_OPER_TYPE      | VARCHAR2 (13) | Last completed operation for the component: <ul style="list-style-type: none"> <li>STATIC</li> <li>INITIALIZING</li> <li>DISABLED</li> <li>GROW</li> <li>SHRINK</li> <li>SHRINK_CANCEL</li> </ul> |
| LAST_OPER_MODE      | VARCHAR2 (9)  | Mode of the last completed operation: <ul style="list-style-type: none"> <li>MANUAL</li> <li>DEFERRED</li> <li>IMMEDIATE</li> </ul>                                                               |
| LAST_OPER_TIME      | DATE          | Start time of the last completed operation                                                                                                                                                        |
| GRANULE_SIZE        | NUMBER        | Granularity of the grow or the shrink operation                                                                                                                                                   |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.37 V\$SGA\_DYNAMIC\_FREE\_MEMORY

V\$SGA\_DYNAMIC\_FREE\_MEMORY displays information about the amount of SGA memory available for future dynamic SGA resize operations.

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CURRENT_SIZE | NUMBER   | Amount of available memory (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID       | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.38 V\$SGA\_RESIZE\_OPS

V\$SGA\_RESIZE\_OPS displays information about the last 800 completed SGA resize operations. This does not include in-progress operations. All sizes are expressed in bytes.

| Column       | Datatype      | Description                                                                                                                                                                  |
|--------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT    | VARCHAR2 (64) | Component name                                                                                                                                                               |
| OPER_TYPE    | VARCHAR2 (13) | <p>Operation type:</p> <ul style="list-style-type: none"> <li>STATIC</li> <li>INITIALIZING</li> <li>DISABLED</li> <li>GROW</li> <li>SHRINK</li> <li>SHRINK_CANCEL</li> </ul> |
| OPER_MODE    | VARCHAR2 (9)  | <p>Operation mode:</p> <ul style="list-style-type: none"> <li>MANUAL</li> <li>DEFERRED</li> <li>IMMEDIATE</li> </ul>                                                         |
| PARAMETER    | VARCHAR2 (80) | Name of the parameter for the resize operation                                                                                                                               |
| INITIAL_SIZE | NUMBER        | Parameter value at the start of the operation                                                                                                                                |
| TARGET_SIZE  | NUMBER        | Requested value of the parameter after the resize                                                                                                                            |
| FINAL_SIZE   | NUMBER        | Real value of the parameter after the resize                                                                                                                                 |

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS     | VARCHAR2 (9) | Completion status of the operation: <ul style="list-style-type: none"><li>• INACTIVE</li><li>• PENDING</li><li>• COMPLETE</li><li>• CANCELLED</li><li>• ERROR</li></ul>                                                                                                                                                                                                                                                                           |
| START_TIME | DATE         | Start time of the operation                                                                                                                                                                                                                                                                                                                                                                                                                       |
| END_TIME   | DATE         | End time of the operation                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.39 V\$SGA\_TARGET\_ADVICE

V\$SGA\_TARGET\_ADVICE displays information about the SGA\_TARGET initialization parameter.

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SGA_SIZE               | NUMBER   | Size of the SGA                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SGA_SIZE_FACTOR        | NUMBER   | Ratio between the SGA_SIZE and the current size of the SGA                                                                                                                                                                                                                                                                                                                                                                                        |
| ESTD_DB_TIME           | NUMBER   | Estimated DB_TIME for this SGA_SIZE                                                                                                                                                                                                                                                                                                                                                                                                               |
| ESTD_DB_TIME_FACTOR    | NUMBER   | Ratio between ESTD_DB_TIME and DB_TIME for the current size of the SGA                                                                                                                                                                                                                                                                                                                                                                            |
| ESTD_PHYSICAL_READS    | NUMBER   | Estimated number of physical reads                                                                                                                                                                                                                                                                                                                                                                                                                |
| ESTD_BUFFER_CACHE_SIZE | NUMBER   | Estimated size of the buffer cache                                                                                                                                                                                                                                                                                                                                                                                                                |
| ESTD_SHARED_POOL_SIZE  | NUMBER   | Estimated size of the shared pool                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                 | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.41 V\$SGASTAT

V\$SGASTAT displays detailed information on the system global area (SGA).

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POOL   | VARCHAR2 (14) | Designates the pool in which the memory in NAME resides: <ul style="list-style-type: none"><li>in-memory pool - Memory is allocated from the In-Memory pool</li><li>java pool - Memory is allocated from the Java pool</li><li>large pool - Memory is allocated from the large pool</li><li>numa pool - Memory is allocated from the NUMA pool</li><li>shared pool - Memory is allocated from the shared pool</li><li>streams pool - Memory is allocated from the Streams pool</li></ul> |
| NAME   | VARCHAR2 (26) | SGA component name                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| BYTES  | NUMBER        | Memory size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul>                                              |

## 10.42 V\$SHARD\_ACK\_RECEIVER

V\$SHARD\_ACK\_RECEIVER displays information about ACK receiver processes.

| Column                      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                         | NUMBER        | Session identifier of the ACK receiver process                                                                                                                                                                                                                                                                                                                                                                                                        |
| SERIAL#                     | NUMBER        | Session serial number of the ACK receiver process                                                                                                                                                                                                                                                                                                                                                                                                     |
| RU_ID                       | NUMBER        | Replication unit (RU) identifier                                                                                                                                                                                                                                                                                                                                                                                                                      |
| STARTUP_TIME                | DATE          | ACK receiver start time                                                                                                                                                                                                                                                                                                                                                                                                                               |
| STATE                       | VARCHAR2 (27) | State of the ACK receiver: <ul style="list-style-type: none"> <li>• ACTIVE</li> <li>• INITIALIZING</li> <li>• POSTING USER TRANSACTION</li> <li>• WAITING FOR ACK FROM SENDER</li> <li>• WAITING FOR EOS FROM SENDER</li> </ul>                                                                                                                                                                                                                       |
| STATE_CHANGED_TIME          | DATE          | Time at which the ACK receiver state last changed                                                                                                                                                                                                                                                                                                                                                                                                     |
| ACK_SENDER_PEER_ID          | NUMBER        | ACK sender's database identifier of the follower                                                                                                                                                                                                                                                                                                                                                                                                      |

## 10.44 V\$SHARD\_APPLY\_COORDINATOR

V\$SHARD\_APPLY\_COORDINATOR displays information about apply coordinator processes.

| Column  | Datatype | Description                                            |
|---------|----------|--------------------------------------------------------|
| SID     | NUMBER   | Session identifier of the apply coordinator process    |
| SERIAL# | NUMBER   | Session serial number of the apply coordinator process |

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                                  |
|--------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE                    | VARCHAR2 (21)  | <p>Apply coordinator state:</p> <ul style="list-style-type: none"> <li>ABORTING - Stopping because of an apply error</li> <li>APPLYING - Passing transactions to apply servers</li> <li>IDLE - Performing no work</li> <li>INITIALIZING - Initializing</li> <li>SHUTTING DOWN CLEANLY - Stopping without an error</li> </ul> |
| APPLY#                   | NUMBER         | <p>Apply process number</p> <p>An apply process is an Oracle background process, prefixed by ap.</p>                                                                                                                                                                                                                         |
| APPLY_NAME               | VARCHAR2 (128) | Name of the apply process                                                                                                                                                                                                                                                                                                    |
| TOTAL_APPLIED            | NUMBER         | Number of transactions applied by the apply process since the apply process was last started                                                                                                                                                                                                                                 |
| TOTAL_WAIT_DEPS          | NUMBER         | Number of times, since the apply process was last started, that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction, because of a dependency between the transactions                                                                            |
| TOTAL_WAIT_COMMITS       | NUMBER         | Number of times, since the apply process was last started, that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits                                                                                                                                       |
| TOTAL_ADMIN              | NUMBER         | Number of administrative jobs issued since the apply process was last started                                                                                                                                                                                                                                                |
| TOTAL_ASSIGNED           | NUMBER         | Number of transactions assigned to apply servers since the apply process was last started                                                                                                                                                                                                                                    |
| TOTAL_RECEIVED           | NUMBER         | Number of transactions received by the coordinator process since the apply process was last started                                                                                                                                                                                                                          |
| TOTAL_IGNORED            | NUMBER         | Number of transactions that were received by the coordinator, but were ignored because they had been previously applied                                                                                                                                                                                                      |
| TOTAL_ROLLBACKS          | NUMBER         | Number of transactions that were rolled back due to unexpected contention                                                                                                                                                                                                                                                    |
| TOTAL_ERRORS             | NUMBER         | Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started                                                                                                                                                                                                 |
| UNASSIGNED_COMPLETE_TXNS | NUMBER         | Number of unassigned complete transactions                                                                                                                                                                                                                                                                                   |
| AUTO_TXN_BUFFER_SIZE     | NUMBER         | Auto-tuned transaction buffer size                                                                                                                                                                                                                                                                                           |
| LWM_TIME                 | DATE           | <p>Time at which the LCR with the lowest log index was recorded</p> <p>The creation time of the LCR with the lowest LCR log index was also recorded at this time.</p>                                                                                                                                                        |
| LWM_LCR_LOG_INDEX        | NUMBER         | LCRs with a commit log index less than or equal to this number have definitely been applied, but some LCRs with a higher commit log index also may have been applied.                                                                                                                                                        |

## 10.48 V\$SHARD\_LCR\_LOGS

V\$SHARD\_LCR\_LOGS displays information about LCR logs.

| Column  | Datatype       | Description                   |
|---------|----------------|-------------------------------|
| INST_ID | NUMBER         | Instance ID                   |
| RU_ID   | NUMBER         | Replication unit (RU) ID      |
| NAME    | VARCHAR2 (257) | Name and path of the log file |

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIZE_GB     | NUMBER       | Size of the log file (in gigabytes)                                                                                                                                                                                                                                                                                                                                                                                                             |
| ROTD_IDX    | NUMBER       | Rotated index                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CURR_FILE   | VARCHAR2 (1) | Indicates whether the file is current (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                            |
| STIDX_HIGH  | NUMBER       | High 4 bytes of the starting log index in the log file                                                                                                                                                                                                                                                                                                                                                                                          |
| STIDX_LOW   | NUMBER       | Low 4 bytes of the starting log index in the log file                                                                                                                                                                                                                                                                                                                                                                                           |
| ENDIDX_HIGH | NUMBER       | High 4 bytes of the ending log index in the log file                                                                                                                                                                                                                                                                                                                                                                                            |
| ENDIDX_LOW  | NUMBER       | Low 4 bytes of the ending logindex in the log file                                                                                                                                                                                                                                                                                                                                                                                              |
| START_SEC   | NUMBER       | Time when this log file was first written to, measured in seconds from the epoch                                                                                                                                                                                                                                                                                                                                                                |

## 10.49 V\$SHARD\_LCR\_PERSISTER

V\$SHARD\_LCR\_PERSISTER displays information about LCR persister processes.

This view displays one row for each LCR persister for a replication unit (RU).

| Column              | Datatype      | Description                                                                                                                                                                                                                        |
|---------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                 | NUMBER        | Session identifier of the LCR persister process                                                                                                                                                                                    |
| SERIAL#             | NUMBER        | Session serial number of the LCR persister process                                                                                                                                                                                 |
| RU_ID               | NUMBER        | Replication unit (RU) identifier                                                                                                                                                                                                   |
| STARTUP_TIME        | DATE          | LCR persister process start time                                                                                                                                                                                                   |
| STATE               | VARCHAR2 (30) | State of the LCR persister: <ul style="list-style-type: none"> <li>ACTIVE</li> <li>INITIALIZING</li> <li>READING FROM IO</li> <li>WAITING FOR BUFFERS TO PERSIST</li> <li>WAITING ON EMPTY QUEUE</li> <li>WRITING TO IO</li> </ul> |
| STATE_CHANGED_TIME  | DATE          | Time at which the LCR persister state last changed                                                                                                                                                                                 |
| PERSISTED_LOG_INDEX | NUMBER        | Last persisted LCR log index                                                                                                                                                                                                       |
| PERSISTED_TIMESTAMP | DATE          | Timestamp of the last persisted LCR                                                                                                                                                                                                |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 10.50 V\$SHARD\_LCR\_PRODUCER

V\$SHARD\_LCR\_PRODUCER displays information about LCR producer processes.

| Column       | Datatype | Description                                       |
|--------------|----------|---------------------------------------------------|
| SID          | NUMBER   | Session identifier of the LCR producer process    |
| SERIAL#      | NUMBER   | Session serial number of the LCR producer process |
| RU_ID        | NUMBER   | Replication unit (RU) identifier                  |
| STARTUP_TIME | DATE     | LCR producer process start time                   |

|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| LAST_BROWSED_LCR_LOG_INDEX | NUMBER        | Last browsed LCR log index                                                                                                                                                                                                            |
| SEND_TIME                  | DATE          | Time at which last LCR was sent                                                                                                                                                                                                       |
| LAST_SENT_LCR_LOG_INDEX    | NUMBER        | Last sent LCR log index                                                                                                                                                                                                               |
| LAST_SENT_LCR_TIME         | DATE          | Creation time of the last sent LCR                                                                                                                                                                                                    |
| ELAPSED_PROPAGATION_TIME   | NUMBER        | Amount of time taken to propagate LCRs (in what unit of time?)                                                                                                                                                                        |
| AVAILABLE_LCRS             | NUMBER        | Number of LCRs available in outbound queue                                                                                                                                                                                            |
| SPID                       | VARCHAR2 (12) | OS process identifier                                                                                                                                                                                                                 |
| CONNECT_ERROR_COUNT        | NUMBER        | Number of network sender connection errors                                                                                                                                                                                            |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB_ID                     | NUMBER   | Database identifier                                                                                                                                                                                                                                                                                                                                                                                                                         |
| TOTAL_BYTES_SENT          | NUMBER   | Total number of bytes sent                                                                                                                                                                                                                                                                                                                                                                                                                  |
| IO_SYNC_READ_TIME         | NUMBER   | Time spent on synchronous reads on Raft logs (in microseconds)                                                                                                                                                                                                                                                                                                                                                                              |
| IO_ASYNC_CNT_LK_AHD_READS | NUMBER   | Number of asynchronous reads on Raft logs                                                                                                                                                                                                                                                                                                                                                                                                   |
| IO_CNT_BLK_ASYNC_REA      | NUMBER   | Number of times blocking was required while waiting for asynchronous look-ahead reads                                                                                                                                                                                                                                                                                                                                                       |
| IO_TIME_BLK_ASYNC_READ    | NUMBER   | Time spent waiting for asynchronous look-ahead reads (in microseconds)                                                                                                                                                                                                                                                                                                                                                                      |
| IO_ASYNC_BLOCKS_READ      | NUMBER   | Total number of file blocks read asynchronously                                                                                                                                                                                                                                                                                                                                                                                             |
| IO_ASYNC_CACHE_HITS       | NUMBER   | Number of file blocks used from the look-ahead buffer                                                                                                                                                                                                                                                                                                                                                                                       |
| IO_BSRCH_SYNC_RDS         | NUMBER   | Number of times binary search was invoked to find a specific LCR                                                                                                                                                                                                                                                                                                                                                                            |
| IO_CNT_CACHE_INVALID      | NUMBER   | Number of look-ahead read blocks that were stale                                                                                                                                                                                                                                                                                                                                                                                            |
| IO_BLKs_REQUIRED          | NUMBER   | Number of look-ahead blocks that were required                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID                    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

**Note:**

This view is available starting with Oracle Database 23ai.

## 10.53 V\$SHARD\_REPLICATION\_UNIT

V\$SHARD\_REPLICATION\_UNIT displays information about replication units (RUs) that are present in a shard.

This view displays one row for each RU.

| Column    | Datatype | Description                                                                                                                                                                                              |
|-----------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SHARD_ID  | NUMBER   | Shard database identifier                                                                                                                                                                                |
| RU_ID     | NUMBER   | Replication unit (RU) identifier                                                                                                                                                                         |
| LEADER_ID | NUMBER   | Leader's SHARD_ID for the corresponding RU                                                                                                                                                               |

## 10.54 V\$SHARED\_POOL\_ADVICE

V\$SHARED\_POOL\_ADVICE displays information about estimated parse time in the shared pool for different pool sizes. The sizes range from 10% of the current shared pool size or the amount of pinned library cache memory (whichever is higher) to 200% of the current shared pool size, in equal intervals. The value of the interval depends on the current size of the shared pool.

| Column                        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| SHARED_POOL_SIZE_FOR_ESTIMATE | NUMBER   | Shared pool size for the estimate (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                |
| SHARED_POOL_SIZE_FACTOR       | NUMBER   | Size factor with respect to the current shared pool size                                                                                                                                                                                                                                                                                                                                                                                        |
| ESTD_LC_SIZE                  | NUMBER   | Estimated memory in use by the library cache (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                     |
| ESTD_LC_MEMORY_OBJECTS        | NUMBER   | Estimated number of library cache memory objects in the shared pool of the specified size                                                                                                                                                                                                                                                                                                                                                       |
| ESTD_LC_TIME_SAVED            | NUMBER   | Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a shared pool of the specified size. This is the time that would have been spent in reloading the required objects in the shared pool had they been aged out due to insufficient amount of available free memory.                                                                                                                         |
| ESTD_LC_TIME_SAVED_FACTOR     | NUMBER   | Estimated parse time saved factor with respect to the current shared pool size                                                                                                                                                                                                                                                                                                                                                                  |
| ESTD_LC_LOAD_TIME             | NUMBER   | Estimated elapsed time (in seconds) for parsing in a shared pool of the specified size                                                                                                                                                                                                                                                                                                                                                          |
| ESTD_LC_LOAD_TIME_FACTOR      | NUMBER   | Estimated load time factor with respect to the current shared pool size                                                                                                                                                                                                                                                                                                                                                                         |
| ESTD_LC_MEMORY_OBJECT_HITS    | NUMBER   | Estimated number of times a library cache memory object was found in a shared pool of the specified size                                                                                                                                                                                                                                                                                                                                        |
| CON_ID                        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.55 V\$SHARED\_POOL\_RESERVED

V\$SHARED\_POOL\_RESERVED displays statistics that help you tune the reserved pool and space within the shared pool.

| Column        | Datatype | Description                                                                |
|---------------|----------|----------------------------------------------------------------------------|
| FREE_SPACE    | NUMBER   | Total amount of free space on the reserved list in bytes <sup>1</sup>      |
| AVG_FREE_SIZE | NUMBER   | Average size of the free memory on the reserved list in bytes <sup>1</sup> |

| Column                    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FREE_COUNT                | NUMBER   | Number of free pieces of memory on the reserved list <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                               |
| MAX_FREE_SIZE             | NUMBER   | Size of the largest free piece of memory on the reserved list in bytes <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                             |
| USED_SPACE                | NUMBER   | Total amount of used memory on the reserved list in bytes <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                          |
| AVG_USED_SIZE             | NUMBER   | Average size of the used memory on the reserved list in bytes <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                      |
| USED_COUNT                | NUMBER   | Number of used pieces of memory on the reserved list <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                               |
| MAX_USED_SIZE             | NUMBER   | Size of the largest used piece of memory on the reserved list in bytes <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                             |
| REQUESTS                  | NUMBER   | Number of times that the reserved list was searched for a free piece of memory <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                     |
| REQUEST_MISSES            | NUMBER   | Number of times the reserved list did not have a free piece of memory to satisfy the request, and started flushing objects from the LRU list <sup>1</sup>                                                                                                                                                                                                                                                                                       |
| LAST_MISS_SIZE            | NUMBER   | Request size of the last request miss in bytes, when the reserved list did not have a free piece of memory to satisfy the request and started flushing objects from the LRU list <sup>1</sup>                                                                                                                                                                                                                                                   |
| MAX_MISS_SIZE             | NUMBER   | Request size of the largest request miss in bytes, when the reserved list did not have a free piece of memory to satisfy the request and started flushing objects from the LRU list <sup>1</sup>                                                                                                                                                                                                                                                |
| REQUEST_FAILURES          | NUMBER   | Number of times that no memory was found to satisfy a request. If an internal flush (used to free up memory) does not meet a memory need, then the error ORA-04031 occurs. <sup>2</sup>                                                                                                                                                                                                                                                         |
| LAST_FAILURE_SIZE         | NUMBER   | Request size of the last failed request in bytes. If an internal flush (used to free up memory) does not meet a memory need, then the error ORA-04031 occurs. <sup>2</sup>                                                                                                                                                                                                                                                                      |
| ABORTED_REQUEST_THRESHOLD | NUMBER   | Minimum size of a request in bytes which signals an ORA-04031 error without flushing objects <sup>2</sup>                                                                                                                                                                                                                                                                                                                                       |
| ABORTED_REQUESTS          | NUMBER   | Number of requests that signalled an ORA-04031 error without flushing objects <sup>2</sup>                                                                                                                                                                                                                                                                                                                                                      |
| LAST_ABORTED_SIZE         | NUMBER   | Last size of the request in bytes that returned an ORA-04031 error without flushing objects from the LRU list <sup>2</sup>                                                                                                                                                                                                                                                                                                                      |
| CON_ID                    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> These columns are valid only if the initialization parameter SHARED\_POOL\_RESERVED\_SIZE is set to a valid value.

<sup>2</sup> These columns contain values which are valid even if SHARED\_POOL\_RESERVED\_SIZE is not set.

## 10.56 V\$SHARED\_SERVER

V\$SHARED\_SERVER displays information on the shared server processes.

| Column | Datatype     | Description              |
|--------|--------------|--------------------------|
| NAME   | VARCHAR2 (4) | Name of the server       |
| PADDR  | RAW (4   8)  | Server's process address |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| MESSAGES     | NUMBER        | Number of messages processed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BYTES        | NUMBER        | Total number of bytes in all messages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| BREAKS       | NUMBER        | Number of breaks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CIRCUIT      | RAW (4   8)   | Address of the circuit currently being serviced                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| IDLE         | NUMBER        | Total idle time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| BUSY         | NUMBER        | Total busy time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| IN_NET       | NUMBER        | Total incoming network wait time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OUT_NET      | NUMBER        | Total outgoing network wait time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| REQUESTS     | NUMBER        | Total number of requests taken from the common queue in this server's lifetime                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| BOUND_TIME   | NUMBER        | Time that a circuit and shared server have been bound (in centiseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| BOUND_REASON | VARCHAR2 (32) | Provides a reason (a short explanation) for why a shared server and circuit could not be unbound.<br><br>This column is empty when a circuit is not bound to a server.<br>When the server starts serving a circuit, BOUND_REASON is empty and remains empty unless the server tries unsuccessfully to unbind the circuit (after it finishes serving the current request).<br>When this column is not empty, it will be cleared once the server and circuit are unbound (that is, once the resources preventing the session migration to another shared server are released). |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                              |

## 10.57 V\$SHARED\_SERVER\_MONITOR

V\$SHARED\_SERVER\_MONITOR displays information for tuning the shared server.

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAXIMUM_CONNECTIONS | NUMBER   | Highest number of virtual circuits in use at one time since the instance started. If this value reaches the value set for the <code>CIRCUITS</code> initialization parameter, then consider raising the value of <code>CIRCUITS</code> .<br><b>See Also:</b> " <a href="#">CIRCUITS</a> "                                                                                                                                                       |
| MAXIMUM_SESSIONS    | NUMBER   | Highest number of shared server sessions in use at one time since the instance started. If this reaches the value set for the <code>SHARED_SERVER_SESSIONS</code> initialization parameter, then consider raising the value of <code>SHARED_SERVER_SESSIONS</code> .<br><b>See Also:</b> " <a href="#">SHARED_SERVER_SESSIONS</a> "                                                                                                             |
| SERVERS_STARTED     | NUMBER   | Total number of shared servers started since the instance started (but not including those started during startup)                                                                                                                                                                                                                                                                                                                              |
| SERVERS_TERMINATED  | NUMBER   | Total number of shared servers stopped by Oracle since the instance started                                                                                                                                                                                                                                                                                                                                                                     |
| SERVERS_HIGHWATER   | NUMBER   | Highest number of servers running at one time since the instance started. If this value reaches the value set for the <code>MAX_SHARED_SERVERS</code> initialization parameter, then consider raising the value of <code>SHARED_SERVERS</code> .<br><b>See Also:</b> " <a href="#">SHARED_SERVERS</a> "                                                                                                                                         |
| DISPATCHERS_CPU     | NUMBER   | Total CPU time of all dispatchers since the instance started (in millionths of a second)                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID              | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.58 V\$SHARED\_SERVER\_STAT

V\$SHARED\_SERVER\_STAT displays statistics for all shared server processes. The statistics are cumulative from the start of the instance.

| Column   | Datatype | Description                                                  |
|----------|----------|--------------------------------------------------------------|
| MESSAGES | NUMBER   | Number of messages processed                                 |
| BYTES    | NUMBER   | Total number of bytes in all messages                        |
| IDLE     | NUMBER   | Total idle time (in hundredths of a second)                  |
| BUSY     | NUMBER   | Total busy time (in hundredths of a second)                  |
| IN_NET   | NUMBER   | Total incoming network wait time (in hundredths of a second) |
| OUT_NET  | NUMBER   | Total outgoing network wait time (in hundredths of a second) |
| REQUESTS | NUMBER   | Total number of requests taken from the common queue         |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.59 V\$SORT\_SEGMENT

V\$SORT\_SEGMENT displays information about every sort segment in a given instance. The view is only updated when the tablespace is of the TEMPORARY type.

| Column          | Datatype      | Description                                            |
|-----------------|---------------|--------------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2 (30) | Name of the tablespace                                 |
| SEGMENT_FILE    | NUMBER        | File number of the first extent                        |
| SEGMENT_BLOCK   | NUMBER        | Block number of the first extent                       |
| EXTENT_SIZE     | NUMBER        | Extent size                                            |
| CURRENT_USERS   | NUMBER        | Number of active users of the segment                  |
| TOTAL_EXTENTS   | NUMBER        | Total number of extents in the segment                 |
| TOTAL_BLOCKS    | NUMBER        | Total number of blocks in the segment                  |
| USED_EXTENTS    | NUMBER        | Extents allocated to active sorts                      |
| USED_BLOCKS     | NUMBER        | Blocks allocated to active sorts                       |
| FREE_EXTENTS    | NUMBER        | Extents not allocated to any sort                      |
| FREE_BLOCKS     | NUMBER        | Blocks not allocated to any sort                       |
| ADDED_EXTENTS   | NUMBER        | Number of extent allocations                           |
| EXTENT_HITS     | NUMBER        | Number of times an unused extent was found in the pool |
| FREED_EXTENTS   | NUMBER        | Number of deallocated extents                          |
| FREE_REQUESTS   | NUMBER        | Number of requests to deallocate                       |
| MAX_SIZE        | NUMBER        | Maximum number of extents ever used                    |
| MAX_BLOCKS      | NUMBER        | Maximum number of blocks ever used                     |
| MAX_USED_SIZE   | NUMBER        | Maximum number of extents used by all sorts            |
| MAX_USED_BLOCKS | NUMBER        | Maximum number of blocks used by all sorts             |
| MAX_SORT_SIZE   | NUMBER        | Maximum number of extents used by an individual sort   |
| MAX_SORT_BLOCKS | NUMBER        | Maximum number of blocks used by an individual sort    |
| RELATIVE_FNO    | NUMBER        | Relative file number of the sort segment header        |
| TS#             | NUMBER        | Tablespace number                                      |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| IS_LOCAL_TEMP | NUMBER   | Indicates whether the sort segment is allocated from a local temporary tablespace (1) or not (0).                                                                                                                                                                                                                                                                                                                                               |

## 10.60 V\$SPPARAMETER

V\$SPPARAMETER displays information about the contents of the server parameter file. If a server parameter file was not used to start the instance, then each row of the view will contain FALSE in the ISSPECIFIED column.

| Column         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FAMILY         | VARCHAR2(80)   | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SID            | VARCHAR2 (80)  | SID for which the parameter is defined.                                                                                                                                                                                                                                                                                                                                                                                                         |
| NAME           | VARCHAR2 (80)  | Name of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TYPE           | VARCHAR2 (11)  | Parameter type                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VALUE          | VARCHAR2 (255) | Parameter value (null if a server parameter file was not used to start the instance)                                                                                                                                                                                                                                                                                                                                                            |
| DISPLAY_VALUE  | VARCHAR2 (255) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.                                                                                                                                                                                                                                                         |
| ISSPECIFIED    | VARCHAR2 (6)   | Indicates whether the parameter was specified in the server parameter file (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                |
| ORDINAL        | NUMBER         | Position (ordinal number) of the parameter value (0 if a server parameter file was not used to start the instance). Useful only for parameters whose values are lists of strings.                                                                                                                                                                                                                                                               |
| UPDATE_COMMENT | VARCHAR2 (255) | Comments associated with the most recent update (null if a server parameter file was not used to start the instance)                                                                                                                                                                                                                                                                                                                            |
| CON_ID         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.61 V\$SQL

V\$SQL lists statistics on shared SQL areas without the GROUP BY clause and contains one row for each child of the original SQL text entered. Statistics displayed in V\$SQL are normally updated at the end of query execution. However, for long running queries, they are updated

every 5 seconds. This makes it easy to see the impact of long running SQL statements while they are still in progress.

| Column                | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT              | VARCHAR2 (1000) | First thousand characters of the SQL text for the current cursor                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_FULLTEXT          | CLOB            | Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V\$SQLTEXT dynamic performance view.                                                                                                                                                                                                                                                                                      |
| SQL_ID                | VARCHAR2 (13)   | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SHARABLE_MEM          | NUMBER          | Amount of shared memory used by the child cursor (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PERSISTENT_MEM        | NUMBER          | Fixed amount of memory used for the lifetime of the child cursor (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                         |
| RUNTIME_MEM           | NUMBER          | Fixed amount of memory required during the execution of the child cursor                                                                                                                                                                                                                                                                                                                                                                                                            |
| SORTS                 | NUMBER          | Number of sorts that were done for the child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LOADED_VERSIONS       | NUMBER          | Indicates whether the context heap is loaded (1) or not (0)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| OPEN_VERSIONS         | NUMBER          | Indicates whether the child cursor is locked (1) or not (0)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| USERS_OPENING         | NUMBER          | Number of users that have any of the child cursors open                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FETCHES               | NUMBER          | Number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXECUTIONS            | NUMBER          | Number of executions that took place on this object since it was brought into the library cache                                                                                                                                                                                                                                                                                                                                                                                     |
| PX_SERVERS_EXECUTIONS | NUMBER          | Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)                                                                                                                                                                                                                                                                                                                                                       |
| END_OF_FETCH_COUNT    | NUMBER          | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column. |
| USERS_EXECUTING       | NUMBER          | Number of users executing the statement                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LOADS                 | NUMBER          | Number of times the object was either loaded or reloaded                                                                                                                                                                                                                                                                                                                                                                                                                            |
| FIRST_LOAD_TIME       | VARCHAR2 (76)   | Timestamp of the parent creation time                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| INVALIDATIONS         | NUMBER          | Number of times this child cursor has been invalidated                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PARSE_CALLS           | NUMBER          | Number of parse calls for this child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DISK_READS            | NUMBER          | Number of disk reads for this child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| COMMAND_TYPE             | NUMBER        | Oracle command type definition                                                                                                                                                                                                                                                                                                                                       |
| OPTIMIZER_MODE           | VARCHAR2(10)  | Mode under which the SQL statement was executed                                                                                                                                                                                                                                                                                                                      |
| OPTIMIZER_COST           | NUMBER        | Cost of this query given by the optimizer                                                                                                                                                                                                                                                                                                                            |
| OPTIMIZER_ENV            | RAW(2000)     | Optimizer environment                                                                                                                                                                                                                                                                                                                                                |
| OPTIMIZER_ENV_HASH_VALUE | NUMBER        | Hash value for the optimizer environment                                                                                                                                                                                                                                                                                                                             |
| PARSING_USER_ID          | NUMBER        | User ID of the user who originally built this child cursor                                                                                                                                                                                                                                                                                                           |
| PARSING_SCHEMA_ID        | NUMBER        | Schema ID that was used to originally build this child cursor                                                                                                                                                                                                                                                                                                        |
| PARSING_SCHEMA_NAME      | VARCHAR2(128) | Schema name that was used to originally build this child cursor                                                                                                                                                                                                                                                                                                      |
| KEPT_VERSIONS            | NUMBER        | Indicates whether this child cursor has been marked to be kept pinned in the cache using the <code>DBMS_SHARED_POOL</code> package                                                                                                                                                                                                                                   |
| ADDRESS                  | RAW(4   8)    | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                                                  |
| TYPE_CHK_HEAP            | RAW(4   8)    | Descriptor of the type check heap for this child cursor                                                                                                                                                                                                                                                                                                              |
| HASH_VALUE               | NUMBER        | Hash value of the parent statement in the library cache                                                                                                                                                                                                                                                                                                              |
| OLD_HASH_VALUE           | NUMBER        | Old SQL hash value                                                                                                                                                                                                                                                                                                                                                   |
| PLAN_HASH_VALUE          | NUMBER        | Numeric representation of the current SQL plan for this cursor. Comparing one <code>PLAN_HASH_VALUE</code> to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).                                                                                                                                    |
| FULL_PLAN_HASH_VALUE     | NUMBER        | Numeric representation of the complete SQL plan for this cursor. Comparing one <code>FULL_PLAN_HASH_VALUE</code> to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the <code>FULL_PLAN_HASH_VALUE</code> cannot be compared across databases releases. It is not backward compatible. |
| CHILD_NUMBER             | NUMBER        | Number of this child cursor                                                                                                                                                                                                                                                                                                                                          |
| SERVICE                  | VARCHAR2(64)  | Service name                                                                                                                                                                                                                                                                                                                                                         |
| SERVICE_HASH             | NUMBER        | Hash value for the name listed in the <code>SERVICE</code> column                                                                                                                                                                                                                                                                                                    |
| MODULE                   | VARCHAR2(64)  | Contains the name of the module that was executing when the SQL statement was first parsed, which is set by calling <code>DBMS_APPLICATION_INFO.SET_MODULE</code>                                                                                                                                                                                                    |
| MODULE_HASH              | NUMBER        | Hash value of the module listed in the <code>MODULE</code> column                                                                                                                                                                                                                                                                                                    |
| ACTION                   | VARCHAR2(64)  | Contains the name of the action that was executing when the SQL statement was first parsed, which is set by calling <code>DBMS_APPLICATION_INFO.SET_ACTION</code>                                                                                                                                                                                                    |
| ACTION_HASH              | NUMBER        | Hash value of the action listed in the <code>ACTION</code> column                                                                                                                                                                                                                                                                                                    |
| SERIALIZABLE_ABORTS      | NUMBER        | Number of times the transaction failed to serialize, producing ORA-08177 errors, per cursor                                                                                                                                                                                                                                                                          |
| OUTLINE_CATEGORY         | VARCHAR2(64)  | If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise the column is left blank.                                                                                                                                                                                                             |
| CPU_TIME                 | NUMBER        | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                  |

| Column                   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ELAPSED_TIME             | NUMBER        | Elapsed database time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then <code>ELAPSED_TIME</code> is the cumulative time for the query coordinator, plus all parallel query worker processes.<br><br>Note that this column displays database time, not wall clock time. In some cases, <code>ELAPSED_TIME</code> can exceed the duration of the query. For example, this can occur for parallel queries. |
| OUTLINE_SID              | NUMBER        | Outline session identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CHILD_ADDRESS            | RAW(4   8)    | Address of the child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQLTYPE                  | NUMBER        | Denotes the version of the SQL language used for this statement                                                                                                                                                                                                                                                                                                                                                                                                                |
| REMOTE                   | VARCHAR2(1)   | Indicates whether the cursor is remote mapped (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| OBJECT_STATUS            | VARCHAR2(19)  | Status of the cursor: <ul style="list-style-type: none"> <li>VALID - Valid, authorized without errors</li> <li>VALID_AUTH_ERROR - Valid, authorized with authorization errors</li> <li>VALID_COMPILE_ERROR - Valid, authorized with compilation errors</li> <li>VALID_UNAUTH - Valid, unauthorized</li> <li>INVALID_UNAUTH - Invalid, unauthorized</li> <li>INVALID - Invalid, unauthorized but keep the timestamp</li> </ul>                                                  |
| LITERAL_HASH_VALUE       | NUMBER        | Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when <code>CURSOR_SHARING</code> is used. This is not the hash value for the SQL statement. If <code>CURSOR_SHARING</code> is not used, then the value is 0.                                                                                                                                                                                                         |
| LAST_LOAD_TIME           | VARCHAR2(76)  | Time at which the query plan was loaded into the library cache                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IS_OBSOLETE              | VARCHAR2(1)   | Indicates whether the cursor has become obsolete (Y) or not (N). This can happen if the number of child cursors is too large.                                                                                                                                                                                                                                                                                                                                                  |
| IS_BIND_SENSITIVE        | VARCHAR2(1)   | Indicates whether the cursor is bind sensitive (Y) or not (N). A query is considered bind-sensitive if the optimizer peeked at one of its bind variable values when computing predicate selectivities and where a change in a bind variable value may cause the optimizer to generate a different plan.                                                                                                                                                                        |
| IS_BIND_AWARE            | VARCHAR2(1)   | Indicates whether the cursor is bind aware (Y) or not (N). A query is considered bind-aware if it has been marked to use extended cursor sharing. The query would already have been marked as bind-sensitive.                                                                                                                                                                                                                                                                  |
| IS_SHAREABLE             | VARCHAR2(1)   | Indicates whether the cursor can be shared (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CHILD_LATCH              | NUMBER        | Child latch number that is protecting the cursor. This column is obsolete and maintained for backward compatibility.                                                                                                                                                                                                                                                                                                                                                           |
| SQL_PROFILE              | VARCHAR2(64)  | SQL profile used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_PATCH                | VARCHAR2(128) | SQL patch used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SQL_PLAN_BASELINE        | VARCHAR2(128) | SQL plan baseline used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PROGRAM_ID               | NUMBER        | Program identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PROGRAM_LINE#            | NUMBER        | Program line number                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| EXACT_MATCHING_SIGNATURE | NUMBER        | Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.                                                                                                                                                                                                                                                                                                                         |

| OPTIMIZED_PHY_READ_REQUESTS    | NUMBER      | Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LOCKED_TOTAL                   | NUMBER      | Total number of times the child cursor has been locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PINNED_TOTAL                   | NUMBER      | Total number of times the child cursor has been pinned                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER      | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                                                                                                                                                                 |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER      | Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells)<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID                         | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                        |
| IS_REOPTIMIZABLE               | VARCHAR2(1) | This column shows whether the next execution matching this child cursor will trigger a reoptimization. The values are: <ul style="list-style-type: none"> <li>Y: If the next execution will trigger a reoptimization</li> <li>R: If the child cursor contains reoptimization information, but will not trigger reoptimization because the cursor was compiled in reporting mode</li> <li>N: If the child cursor has no reoptimization information</li> </ul>                                                                                                                                           |
| IS_RESOLVED_ADAPTIVE_PLAN      | VARCHAR2(1) | This column shows whether all of the adaptive parts of a plan have been resolved to the final plan. Once the plan is resolved, the plan hash value and the plan displayed by <code>DBMS_XPLAN</code> will not change through the end of execution. The values for this column are: <ul style="list-style-type: none"> <li>NULL: If the plan is not adaptive</li> <li>Y: If the plan is fully resolved</li> <li>N: If the plan is not yet fully resolved</li> </ul> <b>See Also:</b> Oracle Database PL/SQL Packages and Types Reference for more information about the <code>DBMS_XPLAN</code> package |
| IM_SCANS                       | NUMBER      | Number of In-Memory Column Store (IM column store) segment scans                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Column                        | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IM_SCAN_BYTES_UNCOMPRESSED    | NUMBER         | Uncompressed size of data scanned from the IM column store                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IM_SCAN_BYTES_INMEMORY        | NUMBER         | In-memory size of data scanned from the IM column store                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DDL_NO_INVALIDATE             | VARCHAR2 (1)   | Indicates if a DDL statement updated a dependent object and did not invalidate this cursor. The values are: <ul style="list-style-type: none"> <li>N: There has not been a DDL statement that updated a dependent object without invalidating this cursor.</li> <li>Y: A DDL statement updated a dependent object and did not invalidate this cursor, but the cursor has not executed since this happened.</li> <li>X: A DDL statement updated a dependent object and did not invalidate this cursor, and the cursor has executed since this happened.</li> </ul>          |
| IS_ROLLING_INVALID            | VARCHAR2 (1)   | Indicates if this cursor is rolling invalidated. The values are: <ul style="list-style-type: none"> <li>N: This cursor is not rolling invalidated.</li> <li>Y: This cursor is rolling invalidated, but the cursor has not executed in this state.</li> <li>X: This cursor is rolling invalidated, and the cursor has executed in this state.</li> </ul>                                                                                                                                                                                                                    |
| IS_ROLLING_REFRESH_INVALID    | VARCHAR2 (1)   | Indicates if this cursor is rolling invalidated and requires execution time refresh. The values are: <ul style="list-style-type: none"> <li>N: This cursor is not a cursor that is rolling invalidated and requires execution time refresh.</li> <li>Y: This cursor is rolling invalidated and requires execution time refresh, but the cursor has not executed in this state.</li> <li>X: This cursor is rolling invalidated and requires execution time refresh, and the cursor has executed in this state.</li> </ul>                                                   |
| RESULT_CACHE                  | VARCHAR2 (1)   | Indicates whether the SQL statement used the result cache (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SQL_QUARANTINE                | VARCHAR2 (128) | If the execution plan for this cursor is quarantined, then this column contains the name of the SQL quarantine configuration (corresponds to the NAME column in the DBA_SQL_QUARANTINE view). Otherwise, this column is null.                                                                                                                                                                                                                                                                                                                                              |
| AVOIDED_EXECUTIONS            | NUMBER         | Number of times this cursor was prevented from being used due to the plan being quarantined                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| HEAP0_LOAD_TIME               | DATE           | Time at which heap0 of the library cache object was loaded                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| HEAP6_LOAD_TIME               | DATE           | Time at which heap6 of the library cache object was loaded<br>A time difference of more than one minute between HEAP0_LOAD_TIME and HEAP6_LOAD_TIME indicates that heap6 has been partially reloaded. For example, the database might have aged out heap6 due to shared pool space pressure and reloaded it at a later time.                                                                                                                                                                                                                                               |
| RESULT_CACHE_REJECTION_REASON | NUMBER         | Numeric code representing the reason for a result cache rejection<br>This column is populated when the query contains a result cache row source (RESULT_CACHE=Y), but fails to create or finish writing a result object. The reason for this failure is recorded as a numeric code in this column.<br>See <a href="#">Block Listing Reasons</a> for a list of rejection codes and recommended remedial actions.<br>If the query does not contain a result cache row source (RESULT_CACHE=N) or the query reused an existing result, then the value of this column is null. |

## Block Listing Reasons

Table 10-2 Result Cache Rejection Reason Codes

| Code | Reason for Result Cache Rejection                                    | Recommended Remedial Action                                                                                                                                                                                                                                                                                      |
|------|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | Success                                                              | N/A                                                                                                                                                                                                                                                                                                              |
| 1000 | Result size exceeds per-result limit for in-memory                   | Increase the value of one or both of the <code>RESULT_CACHE_MAX_SIZE</code> and <code>RESULT_CACHE_MAX_RESULT</code> initialization parameters, or enable spilling results to disk.                                                                                                                              |
| 1001 | Result size exceeds per-result limit on disk                         | Increase the value of one or both of the <code>RESULT_CACHE_MAX_TEMP_SIZE</code> and <code>RESULT_CACHE_MAX_TEMP_RESULT</code> initialization parameters.                                                                                                                                                        |
| 2000 | Unable to acquire enqueues                                           | The system is busy; try again later.                                                                                                                                                                                                                                                                             |
| 2001 | Unable to acquire a DML locks on a referenced object                 | The system is busy; try again later.                                                                                                                                                                                                                                                                             |
| 2002 | Unable to acquire a row cache lock on referenced objects             | The system is busy; try again later.                                                                                                                                                                                                                                                                             |
| 2003 | Unable to allocate memory                                            | The system is busy; try again later.                                                                                                                                                                                                                                                                             |
| 3000 | Result cache ID for the query is blocklisted                         | Remove the cache ID from the blocklist by using the <code>DBMS_RESULT_CACHE</code> package. Exercise caution because the query may have been intentionally blocklisted.                                                                                                                                          |
| 3001 | An object referenced in the query is blocklisted                     | Remove the object ID from the blocklist by using the <code>DBMS_RESULT_CACHE</code> package. Exercise caution because the object may have been intentionally blocklisted.                                                                                                                                        |
| 4001 | Result cache is bypassed                                             | The result cache was bypassed with <code>DBMS_RESULT_CACHE.BYPASS</code> or by setting the <code>RESULT_CACHE_MAX_SIZE</code> initialization parameter to 0. Exercise caution because the bypass may have been intentional.                                                                                      |
| 4002 | Result cache is corrupt                                              | Reset the result cache by using <code>DBMS_RESULT_CACHE.FLUSH</code> . If that does not resolve the problem, then restart the PDB or instance.                                                                                                                                                                   |
| 4003 | RCBG process is down in Oracle RAC                                   | Restart the Oracle RAC instance                                                                                                                                                                                                                                                                                  |
| 4004 | The query was only partially executed                                | The cursor should be fully executed. If the cursor is being executed as part of PL/SQL, then it should be fetched from until the <code>NO_DATA_FOUND</code> error is returned. If the cursor is being executed as part of a SQL query, then do not cancel it by terminating the process (such as typing CTRL+C). |
| 4005 | Temporary space cannot be allocated because the RCBG process is down | Restart the Oracle RAC instance                                                                                                                                                                                                                                                                                  |
| 9999 | Unknown reason                                                       | Unknown                                                                                                                                                                                                                                                                                                          |

## 10.62 V\$SQL\_BIND\_CAPTURE

V\$SQL\_BIND\_CAPTURE displays information on bind variables used by SQL cursors. Each row in the view contains information for one bind variable defined in a cursor. This includes:

- Reference to the cursor defining the bind variable  
(hash\_value, address) for the parent cursor and (hash\_value, child\_address) for the child cursor.
- Bind metadata  
Name, position, data type, character set ID, precision, scale, and maximum length of the bind variable.
- Bind data  
One of the bind values used for the bind variable during a past execution of its associated SQL statement. Bind values are not always captured for this view. Bind values are displayed by this view only when the type of the bind variable is simple (this excludes LONG, LOB, and ADT data types) and when the bind variable is used in the WHERE or HAVING clauses of the SQL statement.

Bind capture is disabled when the STATISTICS\_LEVEL initialization parameter is set to BASIC. This view can be joined with V\$SQLAREA on (HASH\_VALUE, ADDRESS) and with V\$SQL on (HASH\_VALUE, CHILD\_ADDRESS).

| Column        | Datatype       | Description                                                                                                                                                  |
|---------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS       | RAW (4   8)    | Address of the parent cursor                                                                                                                                 |
| HASH_VALUE    | NUMBER         | Hash value of the parent cursor in the library cache. The hash value is a fixed index for the view and should always be used to speed up access to the view. |
| SQL_ID        | VARCHAR2 (13)  | SQL identifier of the parent cursor in the library cache                                                                                                     |
| CHILD_ADDRESS | RAW (4   8)    | Address of the child cursor                                                                                                                                  |
| CHILD_NUMBER  | NUMBER         | Child cursor number                                                                                                                                          |
| NAME          | VARCHAR2 (128) | Name of the bind variable                                                                                                                                    |

| Column          | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POSITION        | NUMBER          | Position of the bind variable in the SQL statement                                                                                                                                                                                                                                                                                                                                                                                              |
| DUP_POSITION    | NUMBER          | If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable.                                                                                                                                                                                                                                                                                                      |
| DATATYPE        | NUMBER          | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.                                                                                                                                                                                                                                                                                               |
| DATATYPE_STRING | VARCHAR2 (15)   | Textual representation of the bind data type. Beginning in Oracle Database 12c, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed.                                                                                                                                                                        |
| CHARACTER_SID   | NUMBER          | National character set identifier                                                                                                                                                                                                                                                                                                                                                                                                               |
| PRECISION       | NUMBER          | Precision (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SCALE           | NUMBER          | Scale (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                       |
| MAX_LENGTH      | NUMBER          | Maximum bind length                                                                                                                                                                                                                                                                                                                                                                                                                             |
| WAS_CAPTURED    | VARCHAR2 (3)    | Indicates whether the bind value was captured (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                 |
| LAST_CAPTURED   | DATE            | Date when the bind value was captured. Bind values are captured when SQL statements are executed. To limit the overhead, binds are captured at most every 15 minutes for a given cursor.                                                                                                                                                                                                                                                        |
| VALUE_STRING    | VARCHAR2 (4000) | Value of the bind represented as a string                                                                                                                                                                                                                                                                                                                                                                                                       |
| VALUE_ANYDATA   | ANYDATA         | Value of the bind represented using the ANYDATA data type. This representation is useful to programmatically decode the value of the bind variable. This column is NULL if a PL/SQL-only data type appears in the DATATYPE column.                                                                                                                                                                                                              |
| CON_ID          | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.63 V\$SQL\_BIND\_DATA

V\$SQL\_BIND\_DATA describes information related to bind variables.

V\$SQL\_BIND\_DATA describes, for each distinct bind variable in each cursor owned by the session querying this view:

- Actual bind data, if the bind variable is user defined
- The underlying literal, if the `CURSOR_SHARING` parameter is set to `FORCE` and the bind variable is system generated. (System-generated binds have a value of 256 in the `SHARED_FLAG2` column.)

| Column          | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CURSOR_NUM      | NUMBER          | Cursor number for this bind                                                                                                                                                                                                                                                                                                                                                                                                                           |
| POSITION        | NUMBER          | Bind position                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DATATYPE        | NUMBER          | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.                                                                                                                                                                                                                                                                                                     |
| SHARED_MAX_LEN  | NUMBER          | Shared maximum length for this bind from the shared cursor object associated with this bind                                                                                                                                                                                                                                                                                                                                                           |
| PRIVATE_MAX_LEN | NUMBER          | Private maximum length for this bind sent from the client                                                                                                                                                                                                                                                                                                                                                                                             |
| ARRAY_SIZE      | NUMBER          | Maximum number of array elements (for array binds only)                                                                                                                                                                                                                                                                                                                                                                                               |
| PRECISION       | NUMBER          | Precision (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SCALE           | NUMBER          | Scale (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SHARED_FLAG     | NUMBER          | Shared bind data flags                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 10.64 V\$SQL\_BIND\_METADATA

V\$SQL\_BIND\_METADATA describes metadata related to bind variables.

V\$SQL\_BIND\_METADATA describes, for each distinct bind variable in each cursor owned by the session querying this view:

- Bind metadata provided by the client, if the bind variable is user defined

- Metadata based on the underlying literal, if the `CURSOR_SHARING` parameter is set to `FORCE` and the bind variable is system-generated.

| Column     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| DATATYPE   | NUMBER         | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.                                                                                                                                                                                                                                                                                                     |
| MAX_LENGTH | NUMBER         | Maximum length of the bind value                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ARRAY_LEN  | NUMBER         | Maximum number of array elements (for array binds only)                                                                                                                                                                                                                                                                                                                                                                                               |
| BIND_NAME  | VARCHAR2 (128) | User-defined or system-generated bind variable name (if used)                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID     | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.65 V\$SQL\_CS\_HISTOGRAM

`V$SQL_CS_HISTOGRAM` summarizes the monitoring information stored by adaptive cursor sharing. This information is used to decide whether to enable extended cursor sharing for a query. It is stored in a histogram, whose bucket's contents are exposed by this view.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS      | RAW (4   8)   | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                                                                                                                                   |
| HASH_VALUE   | NUMBER        | Hash value of the parent statement in the library cache                                                                                                                                                                                                                                                                                                                                                                                               |
| SQL_ID       | VARCHAR2 (13) | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                                                                                                                              |
| CHILD_NUMBER | NUMBER        | Number of the child cursor being monitored                                                                                                                                                                                                                                                                                                                                                                                                            |
| BUCKET_ID    | NUMBER        | Bucket number of the monitoring histogram                                                                                                                                                                                                                                                                                                                                                                                                             |
| COUNT        | NUMBER        | Value in this bucket of the histogram                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.66 V\$SQL\_CS\_SELECTIVITY

V\$SQL\_CS\_SELECTIVITY exposes the valid selectivity ranges for a child cursor in extended cursor sharing mode. A valid range consists of a low and high value for each predicate containing binds. Each predicate's selectivity (with the current bind value) must fall between the corresponding low and high values in order for the child cursor to be shared.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS      | RAW (4   8)   | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                                                                                                                             |
| HASH_VALUE   | NUMBER        | Hash value of the parent statement in the library cache                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_ID       | VARCHAR2 (13) | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                                                                                                                        |
| CHILD_NUMBER | NUMBER        | Number of the child cursor                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PREDICATE    | VARCHAR2 (40) | Predicate whose selectivity must fall between low and high values                                                                                                                                                                                                                                                                                                                                                                               |
| RANGE_ID     | NUMBER        | Identifier for the range used to match up the low and high values for multiple predicates                                                                                                                                                                                                                                                                                                                                                       |
| LOW          | VARCHAR2 (10) | Lower bound for allowable selectivity                                                                                                                                                                                                                                                                                                                                                                                                           |
| HIGH         | VARCHAR2 (10) | Upper bound for allowable selectivity                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.67 V\$SQL\_CS\_STATISTICS

V\$SQL\_CS\_STATISTICS contains the raw execution statistics used by the monitoring component of adaptive cursor sharing. A sample of the executions is monitored. This view exposes which executions were sampled, and what the statistics were for those executions. The statistics are cumulative for each distinct set of bind values.

| Column              | Datatype      | Description                                                                                                         |
|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------|
| ADDRESS             | RAW (4   8)   | Address of the handle to the parent for this cursor                                                                 |
| HASH_VALUE          | NUMBER        | Hash value of the parent statement in the library cache                                                             |
| SQL_ID              | VARCHAR2 (13) | SQL identifier of the parent cursor in the library cache                                                            |
| CHILD_NUMBER        | NUMBER        | Number of the child cursor being monitored                                                                          |
| BIND_SET_HASH_VALUE | NUMBER        | Hash of the values of the binds                                                                                     |
| PEEKED              | VARCHAR2 (1)  | Indicates if this is the bind set used to build the cursor (Y) or not (N)                                           |
| EXECUTIONS          | NUMBER        | Number of times this bind set has been executed and monitored                                                       |
| ROWS_PROCESSED      | NUMBER        | Cumulative number of rows processed by all row sources in the plan over all monitored executions with this bind set |
| BUFFER_GETS         | NUMBER        | Cumulative number of buffer gets over all monitored executions with this bind set                                   |

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU_TIME | NUMBER   | Cumulative CPU time (in microseconds) used by this cursor for monitored executions with this bind set                                                                                                                                                                                                                                                                                                                                           |
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.68 V\$SQL\_CURSOR

V\$SQL\_CURSOR displays debugging information for each cursor associated with the session querying this view.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CURNO         | NUMBER        | Cursor number                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| FLAG          | NUMBER        | Flags set in the cursor                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STATUS        | VARCHAR2 (9)  | Status of the cursor; that is, what state the cursor is in                                                                                                                                                                                                                                                                                                                                                                                      |
| PARENT_HANDLE | RAW (4   8)   | Pointer to the parent cursor handle                                                                                                                                                                                                                                                                                                                                                                                                             |
| PARENT_LOCK   | RAW (4   8)   | Pointer to the parent cursor lock                                                                                                                                                                                                                                                                                                                                                                                                               |
| CHILD_LOCK    | RAW (4   8)   | Pointer to the child cursor lock                                                                                                                                                                                                                                                                                                                                                                                                                |
| CHILD_PIN     | RAW (4   8)   | Pointer to the child cursor pin                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PERS_HEAP_MEM | NUMBER        | Total amount of memory allocated from persistent heap for this cursor                                                                                                                                                                                                                                                                                                                                                                           |
| WORK_HEAP_MEM | NUMBER        | Total amount of memory allocated from the work heap for this cursor                                                                                                                                                                                                                                                                                                                                                                             |
| BIND_VARS     | NUMBER        | Total number of bind positions in the query currently parsed into this cursor                                                                                                                                                                                                                                                                                                                                                                   |
| DEFINE_VARS   | NUMBER        | Total number of define variables in the query currently parsed into this cursor                                                                                                                                                                                                                                                                                                                                                                 |
| BIND_MEM_LOC  | VARCHAR2 (64) | Which memory heap the bind variables are stored in: either the UGA or the CGA                                                                                                                                                                                                                                                                                                                                                                   |
| INST_FLAG     | VARCHAR2 (64) | Instantiation object flags                                                                                                                                                                                                                                                                                                                                                                                                                      |
| INST_FLAG2    | VARCHAR2 (64) | Instantiation object flags (continued)                                                                                                                                                                                                                                                                                                                                                                                                          |
| CHILD_HANDLE  | RAW (4   8)   | Pointer to the child cursor handle                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.69 V\$SQL\_HISTORY

V\$SQL\_HISTORY displays SQL statements tracked by SQL history monitoring.

This view is populated only when the SQL\_HISTORY initialization parameter is set to `true`.

| Column                         | Datatype       | Description                                                                                                                                                                                                                  |
|--------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY                            | NUMBER         | Artificial key to efficiently read a specific SQL history data entry<br>For internal use only.                                                                                                                               |
| SQL_ID                         | VARCHAR2 (13)  | SQL identifier of the SQL statement                                                                                                                                                                                          |
| ELAPSED_TIME                   | NUMBER         | Elapsed time (in microseconds) for the SQL statement                                                                                                                                                                         |
| CPU_TIME                       | NUMBER         | CPU time (in microseconds) for the SQL statement                                                                                                                                                                             |
| BUFFER_GETS                    | NUMBER         | Number of buffer get operations for the SQL statement                                                                                                                                                                        |
| IO_INTERCONNECT_BYTES          | NUMBER         | Number of I/O bytes exchanged between Oracle Database and the storage system for the SQL statement                                                                                                                           |
| PHYSICAL_READ_REQUESTS         | NUMBER         | Number of physical read I/O requests issued by the SQL statement                                                                                                                                                             |
| PHYSICAL_READ_BYTES            | NUMBER         | Number of bytes read from disk by the SQL statement                                                                                                                                                                          |
| PHYSICAL_WRITE_REQUESTS        | NUMBER         | Number of physical write I/O requests issued by the SQL statement                                                                                                                                                            |
| PHYSICAL_WRITE_BYTES           | NUMBER         | Number of bytes written to disk by the SQL statement                                                                                                                                                                         |
| PLSQL_EXEC_TIME                | NUMBER         | PL/SQL execution time (in microseconds) for the SQL statement                                                                                                                                                                |
| JAVA_EXEC_TIME                 | NUMBER         | Java execution time (in microseconds) for the SQL statement                                                                                                                                                                  |
| CLUSTER_WAIT_TIME              | NUMBER         | Cluster wait time (in microseconds) for the SQL statement                                                                                                                                                                    |
| CONCURRENCY_WAIT_TIME          | NUMBER         | Concurrency wait time (in microseconds) for the SQL statement                                                                                                                                                                |
| APPLICATION_WAIT_TIME          | NUMBER         | Application wait time (in microseconds) for the SQL statement                                                                                                                                                                |
| USER_IO_WAIT_TIME              | NUMBER         | User I/O Wait Time (in microseconds) for the SQL statement                                                                                                                                                                   |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER         | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells for the SQL statement<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |
| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER         | Number of I/O bytes that can be filtered by the Exadata storage system for the SQL statement<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                   |
| SQL_TEXT                       | VARCHAR2 (100) | Up to the first 100 characters of the text of the SQL statement                                                                                                                                                              |
| PLAN_HASH_VALUE                | NUMBER         | SQL plan hash value                                                                                                                                                                                                          |
| SQL_EXEC_ID                    | NUMBER         | SQL execution identifier                                                                                                                                                                                                     |
| SQL_EXEC_START                 | DATE           | Time at which the SQL statement execution started                                                                                                                                                                            |
| LAST_ACTIVE_TIME               | DATE           | Time at which the SQL statement execution was last active                                                                                                                                                                    |
| SESSION_USER#                  | NUMBER         | Unique ID number for the session user who issued the SQL statement                                                                                                                                                           |
| CURRENT_USER#                  | NUMBER         | Unique number identifying the current user                                                                                                                                                                                   |
| CHILD_NUMBER                   | NUMBER         | Child number of the SQL statement                                                                                                                                                                                            |
| SID                            | NUMBER         | Session ID for the SQL statement's session                                                                                                                                                                                   |
| SESSION_SERIAL#                | NUMBER         | Session serial number for the SQL statement's session                                                                                                                                                                        |
| MODULE_HASH                    | NUMBER         | Hash value for the module name corresponding to the executing session                                                                                                                                                        |

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTION_HASH     | NUMBER       | Hash value for the action name corresponding to the executing session                                                                                                                                                                                                                                                                                                                                                                           |
| SERVICE_HASH    | NUMBER       | Hash value for the service name corresponding to the executing session                                                                                                                                                                                                                                                                                                                                                                          |
| IS_FULL_SQLTEXT | VARCHAR2 (1) | Indicates whether the SQL_TEXT column displays the entire SQL text (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                               |
| ERROR_SIGNALED  | VARCHAR2 (1) | Indicates whether the SQL statement generated an error (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                           |
| ERROR_NUMBER    | NUMBER       | If the SQL statement failed to execute, the error number (for example, 932 for error ORA-00932)                                                                                                                                                                                                                                                                                                                                                 |
| ERROR_FACILITY  | VARCHAR2 (4) | If the SQL statement failed to execute, the error facility (for example, ORA for error ORA-00932)                                                                                                                                                                                                                                                                                                                                               |
| STATEMENT_TYPE  | VARCHAR2 (5) | Type of SQL statement: <ul style="list-style-type: none"> <li>DDL</li> <li>DML</li> <li>PLSQL</li> <li>QUERY</li> <li>OTHER</li> </ul>                                                                                                                                                                                                                                                                                                          |
| IS_PARALLEL     | VARCHAR2 (1) | Indicates whether the SQL ran as a parallel execution (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.70 V\$SQL\_JOIN\_FILTER

V\$SQL\_JOIN\_FILTER displays performance information about the characteristics of join filters when they are used for a parallel cursor. (A join filter is a bitmap filter applied to table rows before a join operation in order to avoid parallel communication.)

| Column        | Datatype | Description                                                                        |
|---------------|----------|------------------------------------------------------------------------------------|
| QC_SESSION_ID | NUMBER   | QC (Query Coordinator) session ID of the given cursor for the given parallel query |

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QC_INSTANCE_ID      | NUMBER   | QC (Query Coordinator) instance ID of the given cursor for the given parallel query                                                                                                                                                                                                                                                                                                                                                             |
| SQL_PLAN_HASH_VALUE | NUMBER   | SQL plan hash value of the given cursor for the given parallel query                                                                                                                                                                                                                                                                                                                                                                            |
| FILTER_ID           | NUMBER   | An ID that identifies the join filter in the given cursor and corresponds to the filter ID in the execution plan                                                                                                                                                                                                                                                                                                                                |
| LENGTH              | NUMBER   | Total size of the join filter field                                                                                                                                                                                                                                                                                                                                                                                                             |
| BITS_SET            | NUMBER   | Number of bits set in this filter                                                                                                                                                                                                                                                                                                                                                                                                               |
| FILTERED            | NUMBER   | Number of rows seen by the join filter                                                                                                                                                                                                                                                                                                                                                                                                          |
| PROBED              | NUMBER   | Number of rows of the right table that have been tested against the bitmap filter. This is the sum of the filtered rows plus the non-filtered rows.                                                                                                                                                                                                                                                                                             |
| ACTIVE              | NUMBER   | Whether the filter is active (Yes) or not (No)                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID              | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.71 V\$SQL\_MONITOR

V\$SQL\_MONITOR displays SQL statements whose execution have been (or are being) monitored by Oracle.

This view contains global, high-level information about simple and composite database operations.

Oracle Database monitors simple database operations, which are top SQL statements and PL/SQL subprograms, when any of the following conditions is true:

- The operations run in parallel.
- The operations have consumed at least 5 seconds of CPU or I/O time in a single execution.
- Tracking for the operations is forced by the /\*+ MONITOR \*/ hint.

For simple database operations, monitoring statistics are not cumulative over several executions. In this case, one entry in V\$SQL\_MONITOR is dedicated to a single execution of a SQL statement. If the database monitors two executions of the same SQL statement, then each execution has a separate entry in V\$SQL\_MONITOR.

For simple database operations, V\$SQL\_MONITOR has one entry for the parallel execution coordinator process and one entry for each parallel execution server process. Each entry has corresponding entries in V\$SQL\_PLAN\_MONITOR. Because the processes allocated for the parallel execution of a SQL statement are cooperating for the same execution, these entries share the same execution key (the combination of SQL\_ID, SQL\_EXEC\_START, and SQL\_EXEC\_ID).

Oracle Database monitors composite database operations when either of the following conditions is true:

- A database operation was started with `DBMS_SQL_MONITOR.BEGIN_OPERATION` and the operation has consumed at least 5 seconds of CPU or I/O time.
- Tracking for the operation is forced by setting `FORCE_TRACKING` to `Y` in `DBMS_SQL_MONITOR.BEGIN_OPERATION`.

For composite database operations, each row contains an operation whose statistics are accumulated over the SQL statements and PL/SQL subprograms that run in the same session as part of the operation.

The `V$SQL_MONITOR` view contains a subset of the statistics available in `V$SQL`. However, unlike `V$SQL`, monitoring statistics are not cumulative over several executions. Instead, one entry in `V$SQL_MONITOR` is dedicated to a single execution of a SQL statement. If the database monitors two executions of the same SQL statement, then each execution has a separate entry in `V$SQL_MONITOR`.

The primary key is the combination of the columns `SQL_ID`, `SQL_EXEC_START`, and `SQL_EXEC_ID`.

`V$SQL_MONITOR` has one entry for the parallel execution coordinator process, and one entry for each parallel execution server process. Each entry has corresponding entries in `V$SQL_PLAN_MONITOR`. Because the processes allocated for the parallel execution of a SQL statement are cooperating for the same execution, these entries share the same execution key (the composite `SQL_ID`, `SQL_EXEC_START`, and `SQL_EXEC_ID`). You can aggregate the execution key to determine the overall statistics for a parallel execution.

When the SQL statement being monitored is executing, statistics in `V$SQL_MONITOR` are generally refreshed in near real time, once every second. Once the execution ends, monitoring information is not deleted immediately. Instead, it is kept in `V$SQL_MONITOR` for at least one minute. The entry will eventually be deleted to reclaim its space as new statements are monitored.

| Column            | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY               | NUMBER         | Artificial join key to efficiently join <code>V\$SQL_MONITOR</code> with its corresponding plan level monitoring statistics stored in <code>V\$SQL_PLAN_MONITOR</code>                                                                                                                                                                                                                                                                                                        |
| REPORT_ID         | NUMBER         | Unique ID of the XML report stored in Automatic Workload Repository (AWR) for this monitored entity                                                                                                                                                                                                                                                                                                                                                                           |
| STATUS            | VARCHAR2 (19)  | SQL execution status: <ul style="list-style-type: none"> <li>• QUEUED - SQL statement is queued</li> <li>• EXECUTING - SQL statement is still executing</li> <li>• DONE (ERROR) - Execution terminated with an error</li> <li>• DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched</li> <li>• DONE (ALL ROWS) - Execution terminated and all rows were fetched</li> <li>• DONE - Execution terminated (parallel execution)</li> </ul> |
| USER#             | NUMBER         | User ID of the database user who issued the SQL being monitored                                                                                                                                                                                                                                                                                                                                                                                                               |
| USERNAME          | VARCHAR2 (128) | User name of the database user who issued the SQL being monitored                                                                                                                                                                                                                                                                                                                                                                                                             |
| MODULE            | VARCHAR2 (64)  | Name of the executing module when sampled, as set by the <code>DBMS_APPLICATION_INFO.SET_MODULE</code> procedure                                                                                                                                                                                                                                                                                                                                                              |
| ACTION            | VARCHAR2 (64)  | Name of the executing action when sampled, as set by the <code>DBMS_APPLICATION_INFO.SET_ACTION</code> procedure                                                                                                                                                                                                                                                                                                                                                              |
| SERVICE_NAME      | VARCHAR2 (64)  | Service name of the user session                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CLIENT_IDENTIFIER | VARCHAR2 (64)  | Client identifier from the user session                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CLIENT_INFO       | VARCHAR2 (64)  | Client information for the user session                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Column                    | Datatype        | Description                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROGRAM                   | VARCHAR2 (84)   | Name of the operating system program that issued the monitored SQL                                                                                                                                                                                                                                                                                 |
| PLSQL_ENTRY_OBJECT_ID     | NUMBER          | Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack                                                                                                                                                                                                                                       |
| PLSQL_ENTRY_SUBPROGRAM_ID | NUMBER          | Subprogram ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack                                                                                                                                                                                                                                   |
| PLSQL_OBJECT_ID           | NUMBER          | Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL                                                                                                                                                                                                                                                                      |
| PLSQL_SUBPROGRAM_ID       | NUMBER          | Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL                                                                                                                                                                                                                                                                      |
| FIRST_REFRESH_TIME        | DATE            | Time when monitoring of the SQL statement started, generally a few seconds after execution start time                                                                                                                                                                                                                                              |
| LAST_REFRESH_TIME         | DATE            | Time when statistics in V\$SQL_MONITOR were last updated for the SQL statement. Statistics are generally refreshed every second when the statement executes.                                                                                                                                                                                       |
| REFRESH_COUNT             | NUMBER          | Number of times V\$SQL_MONITOR statistics have been refreshed (generally once every second when the SQL statement executes)                                                                                                                                                                                                                        |
| DBOP_EXEC_ID              | NUMBER          | Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.                                                                                                                                                                                                                              |
| DBOP_NAME                 | VARCHAR2 (30)   | Database operation name. If the type is SQL, the DBOP_NAME will be NULL.                                                                                                                                                                                                                                                                           |
| SID                       | NUMBER          | Session identifier executing (or having executed) the SQL statement being monitored                                                                                                                                                                                                                                                                |
| PROCESS_NAME              | VARCHAR2 (5)    | Process name identifier executing (or having executed) the statement; ora if the process is foreground, else the background process name (for example, p001 for PX server p001)                                                                                                                                                                    |
| SQL_ID                    | VARCHAR2 (13)   | SQL identifier of the statement being monitored                                                                                                                                                                                                                                                                                                    |
| SQL_TEXT                  | VARCHAR2 (2000) | Up to the first 2000 characters of the text of the SQL being monitored                                                                                                                                                                                                                                                                             |
| IS_FULL_SQLTEXT           | VARCHAR2 (1)    | Indicates whether the SQL_TEXT column has the entire SQL text (Y) or not (N)                                                                                                                                                                                                                                                                       |
| SQL_EXEC_START            | DATE            | Time when the execution started                                                                                                                                                                                                                                                                                                                    |
| SQL_EXEC_ID               | NUMBER          | Execution identifier. Together, the three columns SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID represent the execution key. The execution key is used to uniquely identify one execution of the SQL statement.                                                                                                                                          |
| SQL_PLAN_HASH_VALUE       | NUMBER          | SQL plan hash value                                                                                                                                                                                                                                                                                                                                |
| SQL_FULL_PLAN_HASH_VALUE  | NUMBER          | Numeric representation of the complete SQL plan for this cursor. Comparing one SQL_FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the SQL_FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |
| EXACT_MATCHING_SIGNATURE  | NUMBER          | Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.                                                                                                                                                                                             |
| FORCE_MATCHING_SIGNATURE  | NUMBER          | Same as EXACT_MATCHING_SIGNATURE but literals in the SQL text are replaced by binds                                                                                                                                                                                                                                                                |
| SQL_CHILD_ADDRESS         | RAW (4   8)     | Address of the child cursor (can be used with SQL_ID to join with V\$SQL)                                                                                                                                                                                                                                                                          |
| SESSION_SERIAL#           | NUMBER          | Session serial number executing the statement being monitored                                                                                                                                                                                                                                                                                      |

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PX_IS_CROSS_INSTANCE | VARCHAR2 (1)   | Indicates whether the SQL statement ran parallel across multiple instances (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| JAVA_EXEC_TIME          | NUMBER         | Java execution time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                          |
| RM_LAST_ACTION          | VARCHAR2 (48)  | <p>The most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following:</p> <ul style="list-style-type: none"> <li>• CANCEL_SQL</li> <li>• KILL_SESSION</li> <li>• LOG_ONLY</li> <li>• SWITCH TO &lt;CG NAME&gt;</li> </ul> <p>For the last value, &lt;CG NAME&gt; is the name of the consumer group that the SQL operation was switched to. If the Resource Plan has since been changed then &lt;CG NAME&gt; is the ID of the consumer group.</p> |
| RM_LAST_ACTION_REASON   | VARCHAR2 (128) | <p>The reason for the most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following:</p> <ul style="list-style-type: none"> <li>• SWITCH_CPU_TIME</li> <li>• SWITCH_IO_REQS</li> <li>• SWITCH_IO_MBS</li> <li>• SWITCH_ELAPSED_TIME</li> <li>• SWITCH_IO_LOGICAL</li> </ul>                                                                                                                                                                      |
| RM_LAST_ACTION_TIME     | DATE           | The time of the most recent action that was taken on this SQL operation by Resource Manager                                                                                                                                                                                                                                                                                                                                                                                                       |
| RM_CONSUMER_GROUP       | VARCHAR2 (128) | The current consumer group for this SQL operation                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Column                         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CON_NAME                       | VARCHAR2 (128) | Container name of the object. The value of this column is NULL in non-CDBs.                                                                                                                                                                                                                                                                                                                                                                     |
| ECID                           | VARCHAR2 (64)  | Execution context identifier (sent by Application Server)                                                                                                                                                                                                                                                                                                                                                                                       |
| IS_ADAPTIVE_PLAN               | VARCHAR2 (1)   | Indicates whether the statistics are from an adaptive plan (Y) or not (N).                                                                                                                                                                                                                                                                                                                                                                      |
| IS_FINAL_PLAN                  | VARCHAR2 (1)   | Indicates whether the statistics are from the final plan (Y) or not (N).                                                                                                                                                                                                                                                                                                                                                                        |
| IN_DBOP_NAME                   | VARCHAR2 (30)  | If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the name of that DBOP                                                                                                                                                                                                                                                                                 |
| IN_DBOP_EXEC_ID                | NUMBER         | If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the execution ID of that DBO                                                                                                                                                                                                                                                                          |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER         | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                          |
| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER         | Number of I/O bytes which can be filtered by the Exadata storage system<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                                           |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER         | Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells)<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                               |
| CURRENT_USER#                  | NUMBER         | Unique number identifying the current user                                                                                                                                                                                                                                                                                                                                                                                                      |
| CURRENT_USERNAME               | VARCHAR2 (128) | Username for the current user                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PDB_REPORT_ID                  | NUMBER         | Unique ID of the XML report of a PDB monitored entity that is stored in the CDB's Automatic Workload Repository (AWR) tables                                                                                                                                                                                                                                                                                                                    |
| PDB_ID                         | NUMBER         | Container ID of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PARSING_SCHEMA#                | NUMBER         | Identifier of the parsing schema                                                                                                                                                                                                                                                                                                                                                                                                                |
| PARSING_SCHEMA_NAME            | VARCHAR2 (128) | Name of the parsing schema                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 10.72 V\$SQL\_MONITOR\_SESSTAT

V\$SQL\_MONITOR\_SESSTAT displays information about statistics that are exposed in V\$SESSTAT.

| Column     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |
| KEY        | NUMBER   | Artificial join key to efficiently join with other database operation views                                                                                                                                                                                                                                                                                                                                                                       |
| STATISTIC# | NUMBER   | Statistic number                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VALUE      | NUMBER   | Value associated with the statistic                                                                                                                                                                                                                                                                                                                                                                                                               |

## 10.73 V\$SQL\_MONITOR\_STATNAME

V\$SQL\_MONITOR\_STATNAME provides information about the plan line statistics exposed in V\$SQL\_PLAN\_MONITOR. A plan line statistic is identified by its group ID (column `GROUP_ID`) and its ID (column `ID`).

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| ID          | NUMBER         | Plan line statistic ID                                                                                                                                                                                                                                                                                                                                                                                                                          |
| GROUP_ID    | NUMBER         | Plan line statistic group ID                                                                                                                                                                                                                                                                                                                                                                                                                    |
| NAME        | VARCHAR2 (40)  | Short name for the statistic                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DESCRIPTION | VARCHAR2 (200) | Short description for the statistic                                                                                                                                                                                                                                                                                                                                                                                                             |
| TYPE        | NUMBER         | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                       |
| FLAGS       | NUMBER         | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 10.74 V\$SQL\_OPTIMIZER\_ENV

V\$SQL\_OPTIMIZER\_ENV displays the contents of the optimizer environment used to build the execution plan of a SQL cursor. This view can be joined with V\$SQLAREA on (HASH\_VALUE, ADDRESS) and with V\$SQL on (HASH\_VALUE, CHILD\_ADDRESS).

| Column        | Datatype      | Description                                                                                                                                                                                            |
|---------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS       | RAW (4   8)   | Address of the parent cursor                                                                                                                                                                           |
| HASH_VALUE    | NUMBER        | Hash value of the parent cursor in the library cache. The hash value is the fixed index for the view and should be used when querying V\$SQL_OPTIMIZER_ENV to avoid scanning the entire library cache. |
| SQL_ID        | VARCHAR2 (13) | SQL identifier                                                                                                                                                                                         |
| CHILD_ADDRESS | RAW (4   8)   | Address of the child cursor                                                                                                                                                                            |
| CHILD_NUMBER  | NUMBER        | Child cursor number                                                                                                                                                                                    |
| ID            | NUMBER        | Unique identifier of the parameter in the optimizer environment                                                                                                                                        |
| NAME          | VARCHAR2 (40) | Name of the parameter                                                                                                                                                                                  |
| ISDEFAULT     | VARCHAR2 (3)  | Indicates whether the parameter is set to the default value (YES) or not (NO)                                                                                                                          |
| VALUE         | VARCHAR2 (25) | Value of the parameter                                                                                                                                                                                 |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.75 V\$SQL\_PLAN

V\$SQL\_PLAN contains the execution plan information for each child cursor loaded in the library cache.

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS              | RAW (4   8)    | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                        |
| HASH_VALUE           | NUMBER         | Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V\$SQLAREA to add the cursor-specific information.                                                                                                                                                                |
| SQL_ID               | VARCHAR2 (13)  | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                   |
| PLAN_HASH_VALUE      | NUMBER         | Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).                                                                                                                     |
| FULL_PLAN_HASH_VALUE | NUMBER         | Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |
| CHILD_ADDRESS        | RAW (4   8)    | Address of the child cursor                                                                                                                                                                                                                                                                                                                |
| CHILD_NUMBER         | NUMBER         | Number of the child cursor that uses this execution plan. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to add the child cursor-specific information.                                                                                                                                                  |
| TIMESTAMP            | DATE           | Date and time when the execution plan was generated                                                                                                                                                                                                                                                                                        |
| OPERATION            | VARCHAR2 (30)  | Name of the internal operation performed in this step (for example, TABLE ACCESS)                                                                                                                                                                                                                                                          |
| OPTIONS              | VARCHAR2 (30)  | A variation on the operation described in the OPERATION column (for example, FULL)                                                                                                                                                                                                                                                         |
| OBJECT_NODE          | VARCHAR2 (40)  | Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed.                                                                                                                            |
| OBJECT#              | NUMBER         | Object number of the table or the index                                                                                                                                                                                                                                                                                                    |
| OBJECT_OWNER         | VARCHAR2 (128) | Name of the user who owns the schema containing the table or index                                                                                                                                                                                                                                                                         |
| OBJECT_NAME          | VARCHAR2 (128) | Name of the table or index                                                                                                                                                                                                                                                                                                                 |
| OBJECT_ALIAS         | VARCHAR2 (261) | Alias for the object                                                                                                                                                                                                                                                                                                                       |
| OBJECT_TYPE          | VARCHAR2 (20)  | Type of the object                                                                                                                                                                                                                                                                                                                         |

| Column            | Datatype        | Description                                                                                                                                                                                                                                                                 |
|-------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIMIZER         | VARCHAR2 (20)   | Current mode of the optimizer for the first row in the plan (statement line), for example, <code>ALL_ROWS</code> . When the operation is a database access (for example, <code>TABLE ACCESS</code> ), this column indicates whether or not the object is analyzed.          |
| ID                | NUMBER          | A number assigned to each step in the execution plan                                                                                                                                                                                                                        |
| PARENT_ID         | NUMBER          | ID of the next execution step that operates on the output of the current step                                                                                                                                                                                               |
| DEPTH             | NUMBER          | Depth (or level) of the operation in the tree. It is not necessary to issue a <code>CONNECT BY</code> statement to get the level information, which is generally used to indent the rows from the <code>PLAN_TABLE</code> table. The root operation (statement) is level 0. |
| POSITION          | NUMBER          | Order of processing for all operations that have the same <code>PARENT_ID</code>                                                                                                                                                                                            |
| SEARCH_COLUMNS    | NUMBER          | Number of index columns with start and stop keys (that is, the number of columns with matching predicates)                                                                                                                                                                  |
| COST              | NUMBER          | Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                            |
| CARDINALITY       | NUMBER          | Estimate, by the cost-based optimizer, of the number of rows produced by the operation                                                                                                                                                                                      |
| BYTES             | NUMBER          | Estimate, by the cost-based optimizer, of the number of bytes produced by the operation                                                                                                                                                                                     |
| OTHER_TAG         | VARCHAR2 (35)   | Describes the contents of the <code>OTHER</code> column. See <code>EXPLAIN PLAN</code> for values.                                                                                                                                                                          |
| PARTITION_START   | VARCHAR2 (64)   | Start partition of a range of accessed partitions                                                                                                                                                                                                                           |
| PARTITION_STOP    | VARCHAR2 (64)   | Stop partition of a range of accessed partitions                                                                                                                                                                                                                            |
| PARTITION_ID      | NUMBER          | Step that computes the pair of values of the <code>PARTITION_START</code> and <code>PARTITION_STOP</code> columns                                                                                                                                                           |
| OTHER             | VARCHAR2 (4000) | Other information specific to the execution step that users may find useful. See <code>EXPLAIN PLAN</code> for values.                                                                                                                                                      |
| DISTRIBUTION      | VARCHAR2 (20)   | Stores the method used to distribute rows from producer query servers to consumer query servers                                                                                                                                                                             |
| CPU_COST          | NUMBER          | CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                        |
| IO_COST           | NUMBER          | I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                        |
| TEMP_SPACE        | NUMBER          | Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                       |
| ACCESS_PREDICATES | VARCHAR2 (4000) | Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.                                                                                                                                                       |
| FILTER_PREDICATES | VARCHAR2 (4000) | Predicates used to filter rows before producing them                                                                                                                                                                                                                        |
| PROJECTION        | VARCHAR2 (4000) | Expressions produced by the operation                                                                                                                                                                                                                                       |
| TIME              | NUMBER          | Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                       |
| QBLOCK_NAME       | VARCHAR2 (128)  | Name of the query block                                                                                                                                                                                                                                                     |

| Column    | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REMARKS   | VARCHAR2 (4000) | Remarks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| OTHER_XML | CLOB            | Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML, which allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> <li>Name of the schema against which the query was parsed</li> <li>Release number of the Oracle Database that produced the explain plan</li> <li>Hash value associated with the execution plan</li> <li>Name (if any) of the outline or the SQL profile used to build the execution plan</li> <li>Indication of whether or not dynamic statistics were used to produce the plan</li> <li>The outline data, a set of optimizer hints that can be used to regenerate the same plan</li> <li>Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans</li> </ul> |
| CON_ID    | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 10.76 V\$SQL\_PLAN\_MONITOR

V\$SQL\_PLAN\_MONITOR displays plan level monitoring statistics for each SQL statement found in V\$SQL\_MONITOR. Each row in V\$SQL\_PLAN\_MONITOR corresponds to an operation of the execution plan being monitored. As with V\$SQL\_MONITOR, statistics exposed in V\$SQL\_PLAN\_MONITOR are generally updated every second when the statement executes. These statistics are recycled on the same basis as V\$SQL\_MONITOR.

To eliminate the overhead of SQL plan monitoring, statistics collected for each operation of the plan do not record timing information such as elapsed time, CPU time, or I/O time. Instead, this timing information can be estimated quite accurately by joining V\$SQL\_PLAN\_MONITOR with V\$ACTIVE\_SESSION\_HISTORY on SQL\_ID, SQL\_EXEC\_START, SQL\_EXEC\_ID, and SQL\_PLAN\_LINE\_ID (simply named PLAN\_LINE\_ID in V\$SQL\_PLAN\_MONITOR). The result of that join is a sample of the activity performed by each operation in the plan, from which an estimate of CPU time and wait time can be derived. This can be achieved by breaking statement level monitoring time statistics found in V\$SQL\_MONITOR in proportion to the number of samples found in V\$ACTIVE\_SESSION\_HISTORY for the corresponding activity type.

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Column              | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY                 | NUMBER         | Foreign key to efficiently join V\$SQL_PLAN_MONITOR with V\$SQL_MONITOR (see V\$SQL_MONITOR)                                                                                                                                                                                                                                                                                                                            |
| STATUS              | VARCHAR2 (19)  | SQL execution status: <ul style="list-style-type: none"> <li>EXECUTING - SQL statement is still executing</li> <li>DONE (ERROR) - Execution terminated with an error</li> <li>DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched</li> <li>DONE (ALL ROWS) - Execution terminated and all rows were fetched</li> <li>DONE - Execution terminated (parallel execution)</li> </ul> |
| FIRST_REFRESH_TIME  | DATE           | Time when monitoring of the SQL statement started                                                                                                                                                                                                                                                                                                                                                                       |
| LAST_REFRESH_TIME   | DATE           | Time when statistics were last updated for the SQL statement                                                                                                                                                                                                                                                                                                                                                            |
| FIRST_CHANGE_TIME   | DATE           | First time a row was produced by this operation                                                                                                                                                                                                                                                                                                                                                                         |
| LAST_CHANGE_TIME    | DATE           | Last time a row was produced by this operation                                                                                                                                                                                                                                                                                                                                                                          |
| REFRESH_COUNT       | NUMBER         | Number of times statistics have been refreshed                                                                                                                                                                                                                                                                                                                                                                          |
| SID                 | NUMBER         | Session identifier executing (or having executed) the SQL statement being monitored                                                                                                                                                                                                                                                                                                                                     |
| PROCESS_NAME        | VARCHAR2 (5)   | Process name identifier                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_ID              | VARCHAR2 (13)  | SQL identifier                                                                                                                                                                                                                                                                                                                                                                                                          |
| SQL_EXEC_START      | DATE           | Time when the execution started                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_EXEC_ID         | NUMBER         | Execution identifier                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_PLAN_HASH_VALUE | NUMBER         | SQL plan hash value                                                                                                                                                                                                                                                                                                                                                                                                     |
| SQL_CHILD_ADDRESS   | RAW (4   8)    | Address of the child cursor                                                                                                                                                                                                                                                                                                                                                                                             |
| PLAN_PARENT_ID      | NUMBER         | ID of the next execution step that operates on the output of the current step                                                                                                                                                                                                                                                                                                                                           |
| PLAN_LINE_ID        | NUMBER         | Plan line number for the entry                                                                                                                                                                                                                                                                                                                                                                                          |
| PLAN_OPERATION      | VARCHAR2 (30)  | Plan operation name (from V\$SQL_PLAN)                                                                                                                                                                                                                                                                                                                                                                                  |
| PLAN_OPTIONS        | VARCHAR2 (30)  | Plan option name (from V\$SQL_PLAN)                                                                                                                                                                                                                                                                                                                                                                                     |
| PLAN_OBJECT_OWNER   | VARCHAR2 (128) | Name of the user who owns the schema containing the table or index                                                                                                                                                                                                                                                                                                                                                      |
| PLAN_OBJECT_NAME    | VARCHAR2 (128) | Name of the table or index                                                                                                                                                                                                                                                                                                                                                                                              |
| PLAN_OBJECT_TYPE    | VARCHAR2 (20)  | Type of the object                                                                                                                                                                                                                                                                                                                                                                                                      |
| PLAN_DEPTH          | NUMBER         | Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.                                                                                                                                                                       |
| PLAN_POSITION       | NUMBER         | Order of processing for all operations that have the same PARENT_ID                                                                                                                                                                                                                                                                                                                                                     |
| PLAN_COST           | NUMBER         | Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                        |
| PLAN_CARDINALITY    | NUMBER         | Estimate, by the cost-based optimizer, of the number of rows produced by the operation                                                                                                                                                                                                                                                                                                                                  |
| PLAN_BYTES          | NUMBER         | Estimate, by the cost-based optimizer, of the number of bytes produced by the operation                                                                                                                                                                                                                                                                                                                                 |
| PLAN_TIME           | NUMBER         | Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                   |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLAN_PARTITION_START    | VARCHAR2 (64) | Start partition of a range of accessed partitions                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PLAN_PARTITION_STOP     | VARCHAR2 (64) | Stop partition of a range of accessed partitions                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PLAN_CPU_COST           | NUMBER        | CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                               |
| PLAN_IO_COST            | NUMBER        | I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                               |
| PLAN_TEMP_SPACE         | NUMBER        | Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                              |
| STARTS                  | NUMBER        | Number of times this operation was executed. For example, an operation is executed multiple times when it is on the right side of a nested-loop join (once for each row of the left input of that nested-loop join).                                                                                                                                                                                                                                               |
| OUTPUT_ROWS             | NUMBER        | Number of rows produced by this operation since the execution started. This number is cumulated for all executions of this operation. Divide by the value of the STARTS column to compute the average number of rows per execution of the operation. Note that the value in the STARTS column is equal to or higher than the value in the OUTPUT_ROWS column. The value will usually be equal, but depending on internal optimizations a higher value may be seen. |
| IO_INTERCONNECT_BYTES   | NUMBER        | Number of I/O bytes exchanged between Oracle Database and the storage system. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                        |
| PHYSICAL_READ_REQUESTS  | NUMBER        | Number of physical read I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                    |
| PHYSICAL_READ_BYTES     | NUMBER        | Number of bytes read from disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                                |
| PHYSICAL_WRITE_REQUESTS | NUMBER        | Number of physical write I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                   |
| PHYSICAL_WRITE_BYTES    | NUMBER        | Number of bytes written to disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                               |
| WORKAREA_MEM            | NUMBER        | Amount of memory (in bytes) used by the operation when the query is executing; NULL if the execution is done. This applies only to operations using a work area, such as sort, hash-join, group-by, and so on.                                                                                                                                                                                                                                                     |
| WORKAREA_MAX_MEM        | NUMBER        | Maximum value (in bytes) for WORKAREA_MEM; NULL if the operation is not using a work area. When the execution is finished, this value will hold the maximum amount of memory consumed by this operation during the execution of the statement.                                                                                                                                                                                                                     |
| WORKAREA_TEMPSEG        | NUMBER        | Amount of temporary space (in bytes) used by the operation when the query is executing; NULL if the operation has not spilled to disk or if the execution is finished                                                                                                                                                                                                                                                                                              |
| WORKAREA_MAX_TEMPSEG    | NUMBER        | Maximum value (in bytes) for WORKAREA_TEMPSEG; NULL if this operation never spilled to disk. When the execution is done, this value will hold the maximum amount of temporary space consumed by this operation during the entire execution.                                                                                                                                                                                                                        |
| OTHERSTAT_GROUP_ID      | NUMBER        | Plan line statistic group identifier (see GROUP_ID column in V\$SQL_MONITOR_STATNAME)                                                                                                                                                                                                                                                                                                                                                                              |

| Column             | Datatype | Description                                                                                               |
|--------------------|----------|-----------------------------------------------------------------------------------------------------------|
| OTHERSTAT_1_ID     | NUMBER   | Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 1 of that plan line  |
| OTHERSTAT_1_TYPE   | NUMBER   | Reserved for internal use                                                                                 |
| OTHERSTAT_1_VALUE  | NUMBER   | Value of statistic number 1 of that plan line                                                             |
| OTHERSTAT_2_ID     | NUMBER   | Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 2 of that plan line  |
| OTHERSTAT_2_TYPE   | NUMBER   | Reserved for internal use                                                                                 |
| OTHERSTAT_2_VALUE  | NUMBER   | Value of statistic number 2 of that plan line                                                             |
| OTHERSTAT_3_ID     | NUMBER   | Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 3 of that plan line  |
| OTHERSTAT_3_TYPE   | NUMBER   | Reserved for internal use                                                                                 |
| OTHERSTAT_3_VALUE  | NUMBER   | Value of statistic number 3 of that plan line                                                             |
| OTHERSTAT_4_ID     | NUMBER   | Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 4 of that plan line  |
| OTHERSTAT_4_TYPE   | NUMBER   | Reserved for internal use                                                                                 |
| OTHERSTAT_4_VALUE  | NUMBER   | Value of statistic number 4 of that plan line                                                             |

| OTHER_XML               | CLOB     | Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML, which allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> <li>Name of the schema against which the query was parsed</li> <li>Release number of the Oracle Database that produced the explain plan</li> <li>Hash value associated with the execution plan</li> <li>Name (if any) of the outline or the SQL profile used to build the execution plan</li> <li>Indication of whether or not dynamic statistics were used to produce the plan</li> <li>The outline data, a set of optimizer hints that can be used to regenerate the same plan</li> <li>Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans</li> </ul> |
| PLAN_OPERATION_INACTIVE | NUMBER   | Indicates whether this plan operation was part of the final resolved plan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PDB_ID                  | NUMBER   | Container ID of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 10.77 V\$SQL\_PLAN\_STATISTICS

V\$SQL\_PLAN\_STATISTICS provides execution statistics at the row source level for each child cursor.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS              | RAW (4   8)   | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                        |
| HASH_VALUE           | NUMBER        | Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V\$SQLAREA to locate the parent cursor.                                                                                                                                                                           |
| SQL_ID               | VARCHAR2 (13) | SQL identifier of the parent statement in the library cache                                                                                                                                                                                                                                                                                |
| PLAN_HASH_VALUE      | NUMBER        | Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line)                                                                                                                      |
| FULL_PLAN_HASH_VALUE | NUMBER        | Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |
| CHILD_ADDRESS        | RAW (4   8)   | Address of the child cursor                                                                                                                                                                                                                                                                                                                |

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHILD_NUMBER        | NUMBER   | Number of the child cursor that uses this work area. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to locate the child cursor using this area.                                                                                                                                                                                                                                                                     |
| OPERATION_ID        | NUMBER   | A number assigned to each step in the execution plan                                                                                                                                                                                                                                                                                                                                                                                                   |
| EXECUTIONS          | NUMBER   | Number of times this cursor has been executed                                                                                                                                                                                                                                                                                                                                                                                                          |
| LAST_STARTS         | NUMBER   | Number of times this operation has been started, during the last execution                                                                                                                                                                                                                                                                                                                                                                             |
| STARTS              | NUMBER   | Number of times this operation has been started, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                                  |
| LAST_OUTPUT_ROWS    | NUMBER   | Number of rows produced by the row source, during the last execution                                                                                                                                                                                                                                                                                                                                                                                   |
| OUTPUT_ROWS         | NUMBER   | Number of rows produced by the row source, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_CR_BUFFER_GETS | NUMBER   | Number of buffers retrieved in consistent mode, during the last execution. Buffers are usually retrieved in consistent mode for queries.                                                                                                                                                                                                                                                                                                               |
| CR_BUFFER_GETS      | NUMBER   | Number of buffers retrieved in consistent mode, accumulated over the past executions. Buffers are usually retrieved in consistent mode for queries.                                                                                                                                                                                                                                                                                                    |
| LAST_CU_BUFFER_GETS | NUMBER   | Number of buffers retrieved in current mode, during the last execution. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.                                                                                                                                                                                                                                                                                       |
| CU_BUFFER_GETS      | NUMBER   | Number of buffers retrieved in current mode, accumulated over the past executions. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.                                                                                                                                                                                                                                                                            |
| LAST_DISK_READS     | NUMBER   | Number of physical disk reads performed by the operation, during the last execution                                                                                                                                                                                                                                                                                                                                                                    |
| DISK_READS          | NUMBER   | Number of physical disk reads performed by the operation, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                         |
| LAST_DISK_WRITES    | NUMBER   | Number of physical disk writes performed by the operation, during the last execution                                                                                                                                                                                                                                                                                                                                                                   |
| DISK_WRITES         | NUMBER   | Number of physical disk writes performed by the operation, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                        |
| LAST_ELAPSED_TIME   | NUMBER   | Elapsed time (in microseconds) corresponding to this operation, during the last execution                                                                                                                                                                                                                                                                                                                                                              |
| ELAPSED_TIME        | NUMBER   | Elapsed time (in microseconds) corresponding to this operation, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID              | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.78 V\$SQL\_PLAN\_STATISTICS\_ALL

V\$SQL\_PLAN\_STATISTICS\_ALL contains memory usage statistics for row sources that use SQL memory (sort or hash-join). This view concatenates information in V\$SQL\_PLAN with execution statistics from V\$SQL\_PLAN\_STATISTICS and V\$SQL\_WORKAREA.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS              | RAW(4   8)    | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                        |
| HASH_VALUE           | NUMBER        | Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V\$SQLAREA to add the cursor-specific information.                                                                                                                                                                |
| SQL_ID               | VARCHAR2(13)  | SQL identifier of the parent statement in the library cache                                                                                                                                                                                                                                                                                |
| PLAN_HASH_VALUE      | NUMBER        | Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line)                                                                                                                      |
| FULL_PLAN_HASH_VALUE | NUMBER        | Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |
| CHILD_ADDRESS        | RAW(4   8)    | Address of the child cursor                                                                                                                                                                                                                                                                                                                |
| CHILD_NUMBER         | NUMBER        | Number of the child cursor that uses this execution plan. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to add the child cursor-specific information.                                                                                                                                                  |
| TIMESTAMP            | DATE          | Date and time when the execution plan was generated                                                                                                                                                                                                                                                                                        |
| OPERATION            | VARCHAR2(30)  | Name of the internal operation performed in this step (for example, TABLE ACCESS)                                                                                                                                                                                                                                                          |
| OPTIONS              | VARCHAR2(30)  | A variation on the operation described in the OPERATION column (for example, FULL)                                                                                                                                                                                                                                                         |
| OBJECT_NODE          | VARCHAR2(40)  | Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed.                                                                                                                            |
| OBJECT#              | NUMBER        | Object number of the table or the index                                                                                                                                                                                                                                                                                                    |
| OBJECT_OWNER         | VARCHAR2(128) | Name of the user who owns the schema containing the table or index                                                                                                                                                                                                                                                                         |
| OBJECT_NAME          | VARCHAR2(128) | Name of the table or index                                                                                                                                                                                                                                                                                                                 |
| OBJECT_ALIAS         | VARCHAR2(261) | Alias for the object                                                                                                                                                                                                                                                                                                                       |
| OBJECT_TYPE          | VARCHAR2(20)  | Type of the object                                                                                                                                                                                                                                                                                                                         |
| OPTIMIZER            | VARCHAR2(20)  | Current mode of the optimizer for the first row in the plan (statement line), for example, CHOOSE. When the operation is a database access (for example, TABLE ACCESS), this column indicates whether or not the object is analyzed.                                                                                                       |
| ID                   | NUMBER        | A number assigned to each step in the execution plan                                                                                                                                                                                                                                                                                       |
| PARENT_ID            | NUMBER        | ID of the next execution step that operates on the output of the current step                                                                                                                                                                                                                                                              |
| DEPTH                | NUMBER        | Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.                                                                                          |

| Column            | Datatype        | Description                                                                                                                                                                           |
|-------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POSITION          | NUMBER          | Order of processing for all operations that have the same PARENT_ID                                                                                                                   |
| SEARCH_COLUMNS    | NUMBER          | Number of index columns with start and stop keys (that is, the number of columns with matching predicates)                                                                            |
| COST              | NUMBER          | Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                      |
| CARDINALITY       | NUMBER          | Estimate, by the cost-based optimizer, of the number of rows produced by the operation                                                                                                |
| BYTES             | NUMBER          | Estimate, by the cost-based optimizer, of the number of bytes produced by the operation                                                                                               |
| OTHER_TAG         | VARCHAR2 (35)   | Describes the contents of the OTHER column. See EXPLAIN PLAN for values.                                                                                                              |
| PARTITION_START   | VARCHAR2 (64)   | Start partition of a range of accessed partitions                                                                                                                                     |
| PARTITION_STOP    | VARCHAR2 (64)   | Stop partition of a range of accessed partitions                                                                                                                                      |
| PARTITION_ID      | NUMBER          | Step that computes the pair of values of the PARTITION_START and PARTITION_STOP columns                                                                                               |
| OTHER             | VARCHAR2 (4000) | Other information specific to the execution step that users may find useful. See EXPLAIN PLAN for values.                                                                             |
| DISTRIBUTION      | VARCHAR2 (20)   | Stores the method used to distribute rows from producer query servers to consumer query servers                                                                                       |
| CPU_COST          | NUMBER          | CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                  |
| IO_COST           | NUMBER          | I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                  |
| TEMP_SPACE        | NUMBER          | Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null. |
| ACCESS_PREDICATES | VARCHAR2 (4000) | Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.                                                                 |
| FILTER_PREDICATES | VARCHAR2 (4000) | Predicates used to filter rows before producing them                                                                                                                                  |
| PROJECTION        | VARCHAR2 (4000) | Expressions produced by the operation                                                                                                                                                 |
| TIME              | NUMBER          | Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                 |
| QBLOCK_NAME       | VARCHAR2 (128)  | Name of the query block                                                                                                                                                               |
| REMARKS           | VARCHAR2 (4000) | Remarks                                                                                                                                                                               |

| Column              | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OTHER_XML           | CLOB         | Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML, which allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> <li>Name of the schema against which the query was parsed</li> <li>Release number of the Oracle Database that produced the explain plan</li> <li>Hash value associated with the execution plan</li> <li>Name (if any) of the outline or the SQL profile used to build the execution plan</li> <li>Indication of whether or not dynamic statistics were used to produce the plan</li> <li>The outline data, a set of optimizer hints that can be used to regenerate the same plan</li> <li>Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans</li> </ul> |
| EXECUTIONS          | NUMBER       | Number of times this cursor has been executed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| LAST_STARTS         | NUMBER       | Number of times this operation has been started, during the last execution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STARTS              | NUMBER       | Number of times this operation has been started, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| REASON            | VARCHAR2 (14)   | Reason for redirection ('INVALID OBJECT', 'ROWID', 'QUERY REWRITE', 'READ ONLY')                                                                                                                                                                                                                                                                                                                                                                |
| ERROR_CODE        | NUMBER          | Error code for local parse                                                                                                                                                                                                                                                                                                                                                                                                                      |
| POSITION          | NUMBER          | Error position, 0 if unknown                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_TEXT_PIECE    | VARCHAR2 (1000) | SQL Text containing position, usually a (qualified) identifier                                                                                                                                                                                                                                                                                                                                                                                  |
| ERROR_MESSAGE     | VARCHAR2 (1000) | Error code's corresponding error message resolved in the database language, no arguments resolved                                                                                                                                                                                                                                                                                                                                               |
| CON_ID            | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.80 V\$SQL\_SHARD

V\$SQL\_SHARD displays the shard information for a shard query's previous execution. This view uniquely maps a shard SQL fragment of a cross shard query to the target shard database.

| Column             | Datatype      | Description                                                                                                            |
|--------------------|---------------|------------------------------------------------------------------------------------------------------------------------|
| SQL_ID             | VARCHAR2 (13) | SQL identifier of a cross shard query on the coordinator                                                               |
| CHILD_NUMBER       | NUMBER        | Cursor child number of a cross shard query on the coordinator                                                          |
| OPERATION_ID       | NUMBER        | Operation ID of a remote node for a shard SQL fragment of a cross shard query                                          |
| SHARD_SQL_ID       | VARCHAR2 (13) | SQL ID of the SQL segment associated with a remote operation identified by the operation ID in the OPERATION_ID column |
| SHARD_ID           | NUMBER        | IDs of shards where the shard SQL fragment was executed                                                                |
| SHARD_CHILD_NUMBER | NUMBER        | Cursor child number of a shard SQL fragment on a shard. The default value is 0.                                        |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.81 V\$SQL\_SHARED\_CURSOR

V\$SQL\_SHARED\_CURSOR explains why a particular child cursor is not shared with existing child cursors. Each column identifies a specific reason why the cursor cannot be shared.

| Column                | Datatype      | Description                                                                                                                                                                                       |
|-----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_ID                | VARCHAR2 (13) | SQL identifier                                                                                                                                                                                    |
| ADDRESS               | RAW (4   8)   | Address of the parent cursor                                                                                                                                                                      |
| CHILD_ADDRESS         | RAW (4   8)   | Address of the child cursor                                                                                                                                                                       |
| CHILD_NUMBER          | NUMBER        | Child number                                                                                                                                                                                      |
| UNBOUND_CURSOR        | VARCHAR2 (1)  | (Y N) The existing child cursor was not fully built (in other words, it was not optimized)                                                                                                        |
| SQL_TYPE_MISMATCH     | VARCHAR2 (1)  | (Y N) The SQL type does not match the existing child cursor                                                                                                                                       |
| OPTIMIZER_MISMATCH    | VARCHAR2 (1)  | (Y N) The optimizer environment does not match the existing child cursor                                                                                                                          |
| OUTLINE_MISMATCH      | VARCHAR2 (1)  | (Y N) The outlines do not match the existing child cursor                                                                                                                                         |
| STATS_ROW_MISMATCH    | VARCHAR2 (1)  | (Y N) The existing statistics do not match the existing child cursor                                                                                                                              |
| LITERAL_MISMATCH      | VARCHAR2 (1)  | (Y N) Non-data literal values do not match the existing child cursor                                                                                                                              |
| FORCE_HARD_PARSE      | VARCHAR2 (1)  | (Y N) For internal use                                                                                                                                                                            |
| EXPLAIN_PLAN_CURSOR   | VARCHAR2 (1)  | (Y N) The child cursor is an explain plan cursor and should not be shared                                                                                                                         |
| BUFFERED_DML_MISMATCH | VARCHAR2 (1)  | (Y N) Buffered DML does not match the existing child cursor                                                                                                                                       |
| PDML_ENV_MISMATCH     | VARCHAR2 (1)  | (Y N) PDML environment does not match the existing child cursor                                                                                                                                   |
| INST_DRTLD_MISMATCH   | VARCHAR2 (1)  | (Y N) Insert direct load does not match the existing child cursor                                                                                                                                 |
| SLAVE_QC_MISMATCH     | VARCHAR2 (1)  | (Y N) The existing child cursor is a worker cursor and the new one was issued by the coordinator (or, the existing child cursor was issued by the coordinator and the new one is a worker cursor) |
| TYPECHECK_MISMATCH    | VARCHAR2 (1)  | (Y N) The existing child cursor is not fully optimized                                                                                                                                            |
| AUTH_CHECK_MISMATCH   | VARCHAR2 (1)  | (Y N) Authorization/translation check failed for the existing child cursor                                                                                                                        |

| Column                    | Datatype     | Description                                                                                                                                                                                                                                         |
|---------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BIND_MISMATCH             | VARCHAR2 (1) | (Y N) The bind metadata does not match the existing child cursor                                                                                                                                                                                    |
| DESCRIBE_MISMATCH         | VARCHAR2 (1) | (Y N) The typecheck heap is not present during the describe for the child cursor                                                                                                                                                                    |
| LANGUAGE_MISMATCH         | VARCHAR2 (1) | (Y N) The language handle does not match the existing child cursor                                                                                                                                                                                  |
| TRANSLATION_MISMATCH      | VARCHAR2 (1) | (Y N) The base objects of the existing child cursor do not match                                                                                                                                                                                    |
| BIND_EQUIV_FAILURE        | VARCHAR2 (1) | (Y N) The bind value's selectivity does not match that used to optimize the existing child cursor                                                                                                                                                   |
| INSUFF_PRIVS              | VARCHAR2 (1) | (Y N) Insufficient privileges on objects referenced by the existing child cursor                                                                                                                                                                    |
| INSUFF_PRIVS_REM          | VARCHAR2 (1) | (Y N) Insufficient privileges on remote objects referenced by the existing child cursor                                                                                                                                                             |
| REMOTE_TRANS_MISMATCH     | VARCHAR2 (1) | (Y N) The remote base objects of the existing child cursor do not match                                                                                                                                                                             |
| LOGMINER_SESSION_MISMATCH | VARCHAR2 (1) | (Y N) LogMiner Session parameters mismatch                                                                                                                                                                                                          |
| INCOMP_LTRL_MISMATCH      | VARCHAR2 (1) | (Y N) Cursor might have some binds (literals) which may be unsafe/non-data. Value mismatch.                                                                                                                                                         |
| OVERLAP_TIME_MISMATCH     | VARCHAR2 (1) | (Y N) Mismatch caused by setting session parameter<br>ERROR_ON_OVERLAP_TIME                                                                                                                                                                         |
| EDITION_MISMATCH          | VARCHAR2 (1) | (Y N) Cursor edition mismatch                                                                                                                                                                                                                       |
| MV_QUERY_GEN_MISMATCH     | VARCHAR2 (1) | (Y N) Internal, used to force a hard-parse when analyzing materialized view queries                                                                                                                                                                 |
| USER_BIND_PEEK_MISMATCH   | VARCHAR2 (1) | (Y N) Cursor is not shared because value of one or more user binds is different and this has a potential to change the execution plan                                                                                                               |
| TYPCHK_DEP_MISMATCH       | VARCHAR2 (1) | (Y N) Cursor has typecheck dependencies                                                                                                                                                                                                             |
| NO_TRIGGER_MISMATCH       | VARCHAR2 (1) | (Y N) Cursor and child have no trigger mismatch                                                                                                                                                                                                     |
| FLASHBACK_CURSOR          | VARCHAR2 (1) | (Y N) Cursor non-shareability due to flashback                                                                                                                                                                                                      |
| ANYDATA_TRANSFORMATION    | VARCHAR2 (1) | (Y N) Is criteria for opaque type transformation and does not match                                                                                                                                                                                 |
| PDDL_ENV_MISMATCH         | VARCHAR2 (1) | (Y N) Environment setting mismatch for parallel DDL cursor (that is, one or more of the following parameter values have changed:<br>PARALLEL_EXECUTION_ENABLED, PARALLEL_DDL_MODE,<br>PARALLEL_DDL_FORCED_DEGREE, or PARALLEL_DDL_FORCED_INSTANCES) |
| TOP_LEVEL_RPI_CURSOR      | VARCHAR2 (1) | (Y N) Is top level RPI cursor                                                                                                                                                                                                                       |
| DIFFERENT_LONG_LENGTH     | VARCHAR2 (1) | (Y N) Value of LONG does not match                                                                                                                                                                                                                  |
| LOGICAL_STANDBY_APPLY     | VARCHAR2 (1) | (Y N) Logical standby apply context does not match                                                                                                                                                                                                  |
| DIFF_CALL_DURN            | VARCHAR2 (1) | (Y N) If worker SQL cursor/single call                                                                                                                                                                                                              |
| BIND_UACS_DIFF            | VARCHAR2 (1) | (Y N) One cursor has bind UACs and one does not                                                                                                                                                                                                     |
| PLSQL_CMP_SWITCHES_DIFF   | VARCHAR2 (1) | (Y N) PL/SQL anonymous block compiled with different PL/SQL compiler switches                                                                                                                                                                       |
| CURSOR_PARTS_MISMATCH     | VARCHAR2 (1) | (Y N) Cursor was compiled with subexecution (cursor parts were executed)                                                                                                                                                                            |

| Column                        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STB_OBJECT_MISMATCH           | VARCHAR2 (1) | (Y N) STB is an internal name for a SQL Management Object Mismatch. A SQL Management Object Mismatch means that either a SQL plan baseline, or a SQL profile, or a SQL patch has been created for your SQL statement between the executions. Because a cursor is a read-only entity, a hard parse is forced to be able to create a new cursor that contains information about the new SQL management object related to this SQL statement. |
| CROSSEDITION_TRIGGER_MISMATCH | VARCHAR2 (1) | (Y N) The set of crossedition triggers to execute might differ                                                                                                                                                                                                                                                                                                                                                                             |
| PQ_SLAVE_MISMATCH             | VARCHAR2 (1) | (Y N) Top-level worker decides not to share cursor                                                                                                                                                                                                                                                                                                                                                                                         |
| TOP_LEVEL_DDL_MISMATCH        | VARCHAR2 (1) | (Y N) Is top-level DDL cursor                                                                                                                                                                                                                                                                                                                                                                                                              |
| MULTI_PX_MISMATCH             | VARCHAR2 (1) | (Y N) Cursor has multiple parallelizers and is worker-compiled                                                                                                                                                                                                                                                                                                                                                                             |
| BIND_PEEKED_PQ_MISMATCH       | VARCHAR2 (1) | (Y N) Cursor based around bind peeked values                                                                                                                                                                                                                                                                                                                                                                                               |
| MV_REWRITE_MISMATCH           | VARCHAR2 (1) | (Y N) Cursor needs recompilation because an SCN was used during compile time due to being rewritten by materialized view                                                                                                                                                                                                                                                                                                                   |
| ROLL_INVALID_MISMATCH         | VARCHAR2 (1) | (Y N) Marked for rolling invalidation and invalidation window exceeded                                                                                                                                                                                                                                                                                                                                                                     |
| OPTIMIZER_MODE_MISMATCH       | VARCHAR2 (1) | (Y N) Parameter OPTIMIZER_MODE mismatch (for example, all_rows versus first_rows_1)                                                                                                                                                                                                                                                                                                                                                        |
| PX_MISMATCH                   | VARCHAR2 (1) | (Y N) Mismatch in one parameter affecting the parallelization of a SQL statement. For example, one cursor was compiled with parallel DML enabled while the other was not.                                                                                                                                                                                                                                                                  |
| MV_STALEOBJ_MISMATCH          | VARCHAR2 (1) | (Y N) Cursor cannot be shared because there is a mismatch in the list of materialized views which were stale when the cursor was built                                                                                                                                                                                                                                                                                                     |
| FLASHBACK_TABLE_MISMATCH      | VARCHAR2 (1) | (Y N) Cursor cannot be shared because there is a mismatch with triggers being enabled and/or referential integrity constraints being deferred                                                                                                                                                                                                                                                                                              |
| LITREP_COMP_MISMATCH          | VARCHAR2 (1) | (Y N) Mismatch in use of literal replacement                                                                                                                                                                                                                                                                                                                                                                                               |
| PLSQL_DEBUG                   | VARCHAR2 (1) | (Y N) Value of the PLSQL_DEBUG parameter for the current session does not match the value used to build the cursor                                                                                                                                                                                                                                                                                                                         |
| LOAD_OPTIMIZER_STATS          | VARCHAR2 (1) | (Y N) A hard parse is forced to initialize extended cursor sharing                                                                                                                                                                                                                                                                                                                                                                         |
| ACL_MISMATCH                  | VARCHAR2 (1) | (Y N) Cached ACL evaluation result stored in the child cursor is not valid for the current session or user                                                                                                                                                                                                                                                                                                                                 |
| FLASHBACK_ARCHIVE_MISMATCH    | VARCHAR2 (1) | (Y N) Value of the FLASHBACK_DATA_ARCHIVE_INTERNAL_CURSOR parameter for the current session does not match the value used to build the cursor                                                                                                                                                                                                                                                                                              |
| LOCK_USER_SCHEMA_FAILED       | VARCHAR2 (1) | (Y N) User or schema used to build the cursor no longer exists<br><b>Note:</b> This sharing criterion is deprecated                                                                                                                                                                                                                                                                                                                        |
| REMOTE_MAPPING_MISMATCH       | VARCHAR2 (1) | (Y N) Reloaded cursor was previously remote-mapped and is currently not remote-mapped. Therefore, the cursor must be reparsed.                                                                                                                                                                                                                                                                                                             |
| LOAD_RUNTIME_HEAP_FAILED      | VARCHAR2 (1) | (Y N) Loading of run-time heap for the new cursor (or reload of aged out cursor) failed                                                                                                                                                                                                                                                                                                                                                    |
| HASH_MATCH_FAILED             | VARCHAR2 (1) | (Y N) No existing child cursors have the unsafe literal bind hash values required by the current cursor                                                                                                                                                                                                                                                                                                                                    |
| PURGED_CURSOR                 | VARCHAR2 (1) | (Y N) Child cursor is marked for purging                                                                                                                                                                                                                                                                                                                                                                                                   |
| BIND_LENGTH_UPGRADEABLE       | VARCHAR2 (1) | (Y N) Bind length(s) required for the current cursor are longer than the bind length(s) used to build the child cursor                                                                                                                                                                                                                                                                                                                     |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USE_FEEDBACK_STATS | VARCHAR2 (1) | (Y N) A hard parse is forced so that the optimizer can reoptimize the query with improved optimizer inputs (for example, cardinality estimates)                                                                                                                                                                                                                                                                                                 |
| REASON             | CLOB         | Child number, id, and reason the cursor is not shared. The content of this column is structured using XML.<br><br>If this column is null, the <code>FORCE_HARD_PARSE</code> , <code>LOAD_RUNTIME_HEAP_FAILED</code> , and <code>HASH_MATCH_FAILED</code> columns may enable you to determine why the child cursor is not shared.                                                                                                                |
| CON_ID             | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.82 V\$SQL\_SHARED\_MEMORY

`V$SQL_SHARED_MEMORY` displays information about the cursor shared memory snapshot. Each SQL statement stored in the shared pool has one or more child objects associated with it. Each child object has several parts, one of which is the context heap, which holds, among other things, the query plan.

| Column       | Datatype        | Description                                                                                                                                                                                                 |
|--------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT     | VARCHAR2 (1000) | SQL text of the shared cursor child object for which this row is displaying information                                                                                                                     |
| SQL_FULLTEXT | CLOB            | Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the <code>V\$SQLTEXT</code> dynamic performance view. |
| HASH_VALUE   | NUMBER          | Hash value of the above SQL text in the shared pool                                                                                                                                                         |
| SQL_ID       | VARCHAR2 (13)   | SQL identifier of the above SQL text in the shared pool                                                                                                                                                     |
| HEAP_DESC    | RAW (4   8)     | Address of the descriptor for the context heap of the child cursor described in this row                                                                                                                    |
| STRUCTURE    | VARCHAR2 (64)   | If the memory chunk described in this row was allocated using a comment of the form "X : Y", then this is the "X" part of the comment                                                                       |
| FUNCTION     | VARCHAR2 (64)   | Similar to the <code>STRUCTURE</code> column, this is the "Y" field of the comment                                                                                                                          |
| CHUNK_COM    | VARCHAR2 (16)   | Whole comment field that was supplied when this memory chunk was allocated                                                                                                                                  |
| CHUNK_PTR    | RAW (4   8)     | Starting address of the allocated memory chunk                                                                                                                                                              |
| CHUNK_SIZE   | NUMBER          | Amount of memory allocated for this chunk                                                                                                                                                                   |
| ALLOC_CLASS  | VARCHAR2 (8)    | Class of memory that this chunk of memory belongs to. It will usually be either <code>FREEABLE</code> or <code>PERMANENT</code> .                                                                           |
| CHUNK_TYPE   | NUMBER          | An index into a table of callback functions that tell the server how to re-create this chunk of memory should it need to be removed from the shared pool based on an LRU algorithm                          |
| SUBHEAP_DESC | RAW (4   8)     | If the parent heap of this context heap is itself a subheap, then this is the address of the descriptor of the parent heap                                                                                  |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.83 V\$SQL\_TESTCASES

V\$SQL\_TESTCASES displays information about test cases exported by SQL Test Case Builder.

You can use this view in conjunction with the V\$DIAG\_INCIDENT view. Join the INCIDENT\_ID column in this view with the INCIDENT\_ID column in V\$DIAG\_INCIDENT to view information about the test case associated with a particular incident.

The V\$SQL\_TESTCASES view requires the existence of a TCB root directory named SQL\_TCB\_DIR. This view will not contain any rows if a TCB root directory does not exist, or if the TCB root directory exists with a name other than SQL\_TCB\_DIR. The operating system directory to which the TCB root directory refers must be writable by the owner of the Oracle Database binaries.

- In Oracle Autonomous Database environments, the TCB root directory is created automatically on each POD during provisioning.
- For on-premises databases, a user who has been granted the DBA role must explicitly create the TCB root directory. See *Oracle Database Administrator's Guide* for more information.

| Column        | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TESTCASE_NAME | VARCHAR2 (512)  | Test case name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SQL_ID        | VARCHAR2 (13)   | SQL identifier of the SQL statement in the test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_TEXT      | VARCHAR2 (1000) | First 1000 characters of text for the SQL statement in the test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_TEXT_FULL | CLOB            | Full text for the SQL statement in the test case, exposed as a CLOB column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| INCIDENT_ID   | NUMBER          | ID for the incident associated with the test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| PROBLEM_TYPE  | NUMBER          | <p>Type of problem for the incident associated with the test case. Possible values:</p> <ul style="list-style-type: none"> <li>1: Performance problem (PROBLEM_TYPE_PERFORMANCE)</li> <li>2: Inconsistent results (PROBLEM_TYPE_WRONG_RESULTS)</li> <li>3: Crash in compilation (PROBLEM_TYPE_COMPILATION_ERROR)</li> <li>4: Crash in execution (PROBLEM_TYPE_EXECUTION_ERROR)</li> </ul> <p>These numeric values, and their associated constant values shown in parentheses, correspond to the numeric and constant values for problem type constants in the DBMS_SQLDIAG package. See <i>Oracle Database PL/SQL Packages and Types Reference</i> for more information.</p> |
| CREATION_DATE | TIMESTAMP (6)   | Creation time for the incident associated with the test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS | VARCHAR2 (10) | Current status for the incident associated with the test case. Possible values: <ul style="list-style-type: none"><li>COMPLETE: The test case export completed successfully</li><li>INCOMPLETE: The test case export failed due to an error</li></ul>                                                                                                                                                                         |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li>n: Where n is the applicable container ID for the rows containing data</li></ul> |

## 10.84 V\$SQL\_WORKAREA

V\$SQL\_WORKAREA displays information about work areas used by SQL cursors. Each SQL statement stored in the shared pool has one or more child cursors that are listed in the V\$SQL view. V\$SQL\_WORKAREA lists all work areas needed by these child cursors; V\$SQL\_WORKAREA can be joined with V\$SQLAREA on (ADDRESS, HASH\_VALUE) and with V\$SQL on (ADDRESS, HASH\_VALUE, CHILD\_NUMBER).

You can use this view to find out answers to the following questions:

- What are the top 10 work areas that require the most cache area?
- For work areas allocated in AUTO mode, what percentage of work areas are running using maximum memory?

| Column           | Datatype       | Description                                                                                                                                                                              |
|------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS          | RAW (4   8)    | Address of the parent cursor handle                                                                                                                                                      |
| HASH_VALUE       | NUMBER         | Hash value of the parent statement in the library cache. Two columns PARENT_HANDLE and HASH_VALUE can be used to join with V\$SQLAREA to locate the parent cursor.                       |
| SQL_ID           | VARCHAR2 (13)  | SQL identifier of the parent statement in the library cache                                                                                                                              |
| CHILD_NUMBER     | NUMBER         | Number of the child cursor that uses this work area. The columns PARENT_HANDLE, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to locate the child cursor using this area. |
| WORKAREA_ADDRESS | RAW (4   8)    | Address of the work area handle. This is the primary key for the view.                                                                                                                   |
| OPERATION_TYPE   | VARCHAR2 (160) | Type of operation using the work area. Can include values such as SORT, HASH JOIN, GROUP BY, BUFFER, BITMAP MERGE, and BITMAP CONSTRUCTION.                                              |
| OPERATION_ID     | NUMBER         | A unique number used to identify the operation in the execution plan. This identifier can be joined to V\$SQL_PLAN to locate the operation that uses this work area.                     |

| Column                 | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY                 | VARCHAR2 (40) | Sizing policy for this work area (MANUAL or AUTO)                                                                                                                                                                                                                                                                                                                                                                                               |
| ESTIMATED_OPTIMAL_SIZE | NUMBER        | Estimated size (in bytes) required by this work area to execute the operation completely in memory (optimal execution). Derived from either optimizer statistics or previous executions.                                                                                                                                                                                                                                                        |
| ESTIMATED_ONEPASS_SIZE | NUMBER        | Estimated size (in bytes) required by this work area to execute the operation in a single pass. Derived from either optimizer statistics or previous executions.                                                                                                                                                                                                                                                                                |
| LAST_MEMORY_USED       | NUMBER        | Memory (in bytes) used by this work area during the last execution of the cursor                                                                                                                                                                                                                                                                                                                                                                |
| LAST_EXECUTION         | VARCHAR2 (40) | Indicates whether this work area runs using OPTIMAL, ONE PASS, or ONE PASS memory requirement (or MULTI-PASS), during the last execution of the cursor                                                                                                                                                                                                                                                                                          |
| LAST_DEGREE            | NUMBER        | Degree of parallelism used during the last execution of this operation                                                                                                                                                                                                                                                                                                                                                                          |
| TOTAL_EXECUTIONS       | NUMBER        | Number of times this work area was active                                                                                                                                                                                                                                                                                                                                                                                                       |
| OPTIMAL_EXECUTIONS     | NUMBER        | Number of times this work area ran in optimal mode                                                                                                                                                                                                                                                                                                                                                                                              |
| ONEPASS_EXECUTIONS     | NUMBER        | Number of times this work area ran in one-pass mode                                                                                                                                                                                                                                                                                                                                                                                             |
| MULTIPASSES_EXECUTIONS | NUMBER        | Number of times this work area ran below the one-pass memory requirement                                                                                                                                                                                                                                                                                                                                                                        |
| ACTIVE_TIME            | NUMBER        | Average time this work area is active (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                               |
| MAX_TEMPSEG_SIZE       | NUMBER        | Maximum temporary segment size (in bytes) created by an instantiation of this work area. This column is NULL if this work area has never spilled to disk.                                                                                                                                                                                                                                                                                       |
| LAST_TEMPSEG_SIZE      | NUMBER        | Temporary segment size (in bytes) created in the last instantiation of this work area. This column is NULL if the last instantiation of this work area did not spill to disk.                                                                                                                                                                                                                                                                   |
| CON_ID                 | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.85 V\$SQL\_WORKAREA\_ACTIVE

V\$SQL\_WORKAREA\_ACTIVE contains an instantaneous view of the work areas currently allocated by the system. You can join this view against V\$SQL\_WORKAREA on WORKAREA\_ADDRESS to access

the definition of that work area. If a work area spills to disk, then this view contains information for the temporary segment created on behalf of this work area.

The last three columns are included to enable joining V\$SQL\_WORKAREA\_ACTIVE with V\$TEMPSEG\_USAGE to retrieve more information on this temporary segment.

You can use this view to answer the following:

- What are the top 10 largest work areas currently allocated in the system?
- What percentage of memory is over-allocated (`EXPECTED_SIZE < ACTUAL_MEM_USED`) and under-allocated (`EXPECTED_SIZE > ACTUAL_MEM_USED`)?
- What are the active work areas using more memory than what is expected by the memory manager?
- What are the active work areas that have spilled to disk?

| Column           | Datatype       | Description                                                                                                                                                                                                                                                                                        |
|------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_HASH_VALUE   | NUMBER         | Hash value of the SQL statement that is currently being executed                                                                                                                                                                                                                                   |
| SQL_ID           | VARCHAR2 (13)  | SQL identifier of the SQL statement that is currently being executed                                                                                                                                                                                                                               |
| SQL_EXEC_START   | DATE           | Time when the execution of the SQL currently executed by this session started                                                                                                                                                                                                                      |
| SQL_EXEC_ID      | NUMBER         | SQL execution identifier (see V\$SQL_MONITOR)                                                                                                                                                                                                                                                      |
| WORKAREA_ADDRESS | RAW (4   8)    | Address of the work area handle. This is the primary key for the view.                                                                                                                                                                                                                             |
| OPERATION_TYPE   | VARCHAR2 (160) | Type of operation using the work area. Can include values such as SORT, HASH JOIN, GROUP BY, BUFFER, BITMAP MERGE, and BITMAP CONSTRUCTION.                                                                                                                                                        |
| OPERATION_ID     | NUMBER         | A unique number used to identify the operation in the execution plan. This identifier can be joined to V\$SQL_PLAN to locate the operation that uses this work area.                                                                                                                               |
| POLICY           | VARCHAR2 (24)  | Sizing policy for this work area (MANUAL or AUTO)                                                                                                                                                                                                                                                  |
| SID              | NUMBER         | Session identifier                                                                                                                                                                                                                                                                                 |
| QCINST_ID        | NUMBER         | Query coordinator instance identifier. Along with QCSID, enables you to uniquely identify the query coordinator.                                                                                                                                                                                   |
| QCSID            | NUMBER         | Query coordinator session identifier. This is the same as the SID if the work area is allocated by a serial cursor.                                                                                                                                                                                |
| ACTIVE_TIME      | NUMBER         | Average time this work area is active (in microseconds)                                                                                                                                                                                                                                            |
| WORK_AREA_SIZE   | NUMBER         | Maximum size (in bytes) of the work area as it is currently used by the operation                                                                                                                                                                                                                  |
| EXPECTED_SIZE    | NUMBER         | Expected size (in bytes) for this work area. EXPECTED_SIZE is set on behalf of the operation by the memory manager. Memory can be over-allocated when WORK_AREA_SIZE has a higher value than EXPECTED_SIZE. This can occur when the operation using this work area takes a long time to resize it. |
| ACTUAL_MEM_USED  | NUMBER         | Amount of PGA memory (in bytes) currently allocated on behalf of this work area. This value should range between 0 and WORK_AREA_SIZE.                                                                                                                                                             |
| MAX_MEM_USED     | NUMBER         | Maximum memory amount (in bytes) used by this work area                                                                                                                                                                                                                                            |
| NUMBER_PASSES    | NUMBER         | Number of passes corresponding to this work area (0 if running in OPTIMAL mode)                                                                                                                                                                                                                    |
| TEMPSEG_SIZE     | NUMBER         | Size (in bytes) of the temporary segment used on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.                                                                                                                                                    |

| Column   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABSPACE | VARCHAR2 (128) | Tablespace name for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.                                                                                                                                                                                                                                                                                               |
| SEGRFNO# | NUMBER         | Relative file number within the tablespace for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.                                                                                                                                                                                                                                                                    |
| SEGBLK#  | NUMBER         | Block number for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.                                                                                                                                                                                                                                                                                                  |
| CON_ID   | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.86 V\$SQL\_WORKAREA\_HISTOGRAM

V\$SQL\_WORKAREA\_HISTOGRAM displays the cumulative work area execution statistics (cumulated since instance startup) for different work area groups. The work areas are split into 33 groups based on their optimal memory requirements with the requirements increasing in powers of two. That is, work areas whose optimal requirement varies from 0 KB to 1 KB, 1 KB to 2 KB, 2 KB to 4 KB, ... and 2 TB to 4 TB.

For each work area group, the V\$SQL\_WORKAREA\_HISTOGRAM view shows how many work areas in that group were able to run in optimal mode, how many were able to run in one-pass mode, and finally how many ran in multi-pass mode. The DBA can take a snapshot at the beginning and the end of a desired time interval to derive the same statistics for that interval.

| Column             | Datatype | Description                                                                                                                                                                       |
|--------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOW_OPTIMAL_SIZE   | NUMBER   | Lower bound for the optimal memory requirement of work areas included in this row (bytes)                                                                                         |
| HIGH_OPTIMAL_SIZE  | NUMBER   | Upper bound for the optimal memory requirement of work areas included in this row (bytes)                                                                                         |
| OPTIMAL_EXECUTIONS | NUMBER   | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in optimal mode since instance startup  |
| ONEPASS_EXECUTIONS | NUMBER   | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in one-pass mode since instance startup |

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MULTIPASSES_EXECUTIONS | NUMBER   | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in multi-pass mode since instance startup                                                                                                                                                                                                                                                             |
| TOTAL_EXECUTIONS       | NUMBER   | Sum of OPTIMAL_EXECUTIONS, ONEPASS_EXECUTIONS, and MULTIPASSES_EXECUTIONS                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID                 | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.87 V\$SQLAREA

V\$SQLAREA displays statistics on shared SQL areas and contains one row per SQL string. It provides statistics on SQL statements that are in memory, parsed, and ready for execution.

| Column          | Datatype        | Description                                                                                                                                                                         |
|-----------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT        | VARCHAR2 (1000) | First thousand characters of the SQL text for the current cursor                                                                                                                    |
| SQL_FULLTEXT    | CLOB            | All characters of the SQL text for the current cursor                                                                                                                               |
| SQL_ID          | VARCHAR2 (13)   | SQL identifier of the parent cursor in the library cache                                                                                                                            |
| SHARABLE_MEM    | NUMBER          | Amount of shared memory used by a cursor. If multiple child cursors exist, then the sum of all shared memory used by all child cursors.                                             |
| PERSISTENT_MEM  | NUMBER          | Fixed amount of memory used for the lifetime of an open cursor. If multiple child cursors exist, then the fixed sum of memory used for the lifetime of all the child cursors.       |
| RUNTIME_MEM     | NUMBER          | Fixed amount of memory required during execution of a cursor. If multiple child cursors exist, then the fixed sum of all memory required during execution of all the child cursors. |
| SORTS           | NUMBER          | Sum of the number of sorts that were done for all the child cursors                                                                                                                 |
| VERSION_COUNT   | NUMBER          | Number of child cursors that are present in the cache under this parent                                                                                                             |
| LOADED_VERSIONS | NUMBER          | Number of child cursors that are present in the cache and have their context heap loaded                                                                                            |
| OPEN_VERSIONS   | NUMBER          | Number of child cursors that are currently open under this current parent                                                                                                           |
| USERS_OPENING   | NUMBER          | Number of users that have any of the child cursors open                                                                                                                             |
| FETCHES         | NUMBER          | Number of fetches associated with the SQL statement                                                                                                                                 |
| EXECUTIONS      | NUMBER          | Total number of executions, totalled over all the child cursors                                                                                                                     |

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PX_SERVERS_EXECUTIONS    | NUMBER         | Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)                                                                                                                                                                                                                                                                                                                                                                                 |
| END_OF_FETCH_COUNT       | NUMBER         | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the <code>END_OF_FETCH_COUNT</code> column should be less or equal to the value of the <code>EXECUTIONS</code> column. |
| USERS_EXECUTING          | NUMBER         | Total number of users executing the statement over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LOADS                    | NUMBER         | Number of times the object was loaded or reloaded                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FIRST_LOAD_TIME          | VARCHAR2 (76)  | Timestamp of the parent creation time                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| INVALIDATIONS            | NUMBER         | Total number of invalidations over all the child cursors                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PARSE_CALLS              | NUMBER         | Sum of all parse calls to all the child cursors under this parent                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DISK_READS               | NUMBER         | Sum of the number of disk reads over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DIRECT_WRITES            | NUMBER         | Sum of the number of direct writes over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| DIRECT_READS             | NUMBER         | Sum of the number of direct reads over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| BUFFER_GETS              | NUMBER         | Sum of buffer gets over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| APPLICATION_WAIT_TIME    | NUMBER         | Application wait time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CONCURRENCY_WAIT_TIME    | NUMBER         | Concurrency wait time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| OPTIMIZER_ENV_HASH_VALUE | NUMBER         | Hash value for the optimizer environment                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PARSING_USER_ID          | NUMBER         | User ID of the user that has parsed the very first cursor under this parent                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PARSING_SCHEMA_ID        | NUMBER         | Schema ID that was used to parse this child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| PARSING_SCHEMA_NAME      | VARCHAR2 (128) | Schema name that was used to parse this child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| KEPT_VERSIONS            | NUMBER         | Number of child cursors that have been marked to be kept using the <code>DBMS_SHARED_POOL</code> package                                                                                                                                                                                                                                                                                                                                                                                                      |
| ADDRESS                  | RAW (4   8)    | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| HASH_VALUE               | NUMBER         | Hash value of the parent statement in the library cache                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| OLD_HASH_VALUE           | NUMBER         | Old SQL hash value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| PLAN_HASH_VALUE          | NUMBER         | Numeric representation of the current SQL plan for this cursor. Comparing one <code>PLAN_HASH_VALUE</code> to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).                                                                                                                                                                                                                                                                             |

| Column                        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FULL_PLAN_HASH_VALUE          | NUMBER        | Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.                                                                                    |
| MODULE                        | VARCHAR2 (64) | Contains the name of the module that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_MODULE                                                                                                                                                                                                                                                                                 |
| MODULE_HASH                   | NUMBER        | Hash value of the module that is named in the MODULE column                                                                                                                                                                                                                                                                                                                                                                   |
| ACTION                        | VARCHAR2 (64) | Contains the name of the action that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_ACTION                                                                                                                                                                                                                                                                                 |
| ACTION_HASH                   | NUMBER        | Hash value of the action that is named in the ACTION column                                                                                                                                                                                                                                                                                                                                                                   |
| SERIALIZABLE_ABORTS           | NUMBER        | Number of times the transaction failed to serialize, producing ORA-08177 errors, totalled over all the child cursors                                                                                                                                                                                                                                                                                                          |
| OUTLINE_CATEGORY              | VARCHAR2 (64) | If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise the column is left blank.                                                                                                                                                                                                                                                                      |
| CPU_TIME                      | NUMBER        | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_TIME                  | NUMBER        | Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then ELAPSED_TIME is the cumulative time for the query coordinator, plus all parallel query worker processes.                                                                                                                                                                                 |
| OUTLINE_SID                   | VARCHAR2 (40) | Outline session identifier                                                                                                                                                                                                                                                                                                                                                                                                    |
| LAST_ACTIVE_CHILD_ADDRES<br>S | RAW (4   8)   | Address (identifier) of the child cursor that was the last to be active in the group (that is, the child cursor on behalf of which statistics in V\$SQL were updated)                                                                                                                                                                                                                                                         |
| REMOTE                        | VARCHAR2 (1)  | Indicates whether the cursor is remote mapped (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                  |
| OBJECT_STATUS                 | VARCHAR2 (19) | Status of the cursor: <ul style="list-style-type: none"> <li>VALID - Valid, authorized without errors</li> <li>VALID_AUTH_ERROR - Valid, authorized with authorization errors</li> <li>VALID_COMPILE_ERROR - Valid, authorized with compilation errors</li> <li>VALID_UNAUTH - Valid, unauthorized</li> <li>INVALID_UNAUTH - Invalid, unauthorized</li> <li>INVALID - Invalid, unauthorized but keep the timestamp</li> </ul> |
| LITERAL_HASH_VALUE            | NUMBER        | Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when CURSOR_SHARING is used. This is not the hash value for the SQL statement. If CURSOR_SHARING is not used, then the value is 0.                                                                                                                                                                                  |
| LAST_LOAD_TIME                | DATE          | Time at which the query plan was loaded into the library cache                                                                                                                                                                                                                                                                                                                                                                |
| IS_OBSOLETE                   | VARCHAR2 (1)  | Indicates whether the cursor has become obsolete (Y) or not (N). This can happen if the number of child cursors is too large.                                                                                                                                                                                                                                                                                                 |
| IS_BIND_SENSITIVE             | VARCHAR2 (1)  | Indicates whether the cursor is bind sensitive (Y) or not (N). A query is considered bind-sensitive if the optimizer peeked at one of its bind variable values when computing predicate selectivities and where a change in a bind variable value may cause the optimizer to generate a different plan.                                                                                                                       |

| Column                         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS_BIND_AWARE                  | VARCHAR2 (1)   | Indicates whether the cursor is bind aware (Y) or not (N). A query is considered bind-aware if it has been marked to use extended cursor sharing. The query would already have been marked as bind-sensitive.                                                                                                                                                                                                                                   |
| CHILD_LATCH                    | NUMBER         | Child latch number that is protecting the cursor. This column is obsolete and maintained for backward compatibility.                                                                                                                                                                                                                                                                                                                            |
| SQL_PROFILE                    | VARCHAR2 (64)  | SQL profile used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                                     |
| SQL_PATCH                      | VARCHAR2 (128) | SQL patch used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                                       |
| SQL_PLAN_BASELINE              | VARCHAR2 (128) | SQL plan baseline used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                               |
| PROGRAM_ID                     | NUMBER         | Program identifier                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PROGRAM_LINE#                  | NUMBER         | Program line number                                                                                                                                                                                                                                                                                                                                                                                                                             |
| EXACT_MATCHING_SIGNATURE       | NUMBER         | Signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>EXACT</code>                                                                                                                                                                                                                                                                                                                                                      |
| FORCE_MATCHING_SIGNATURE       | NUMBER         | Signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>FORCE</code>                                                                                                                                                                                                                                                                                                                                                      |
| LAST_ACTIVE_TIME               | DATE           | Time at which the query plan was last active                                                                                                                                                                                                                                                                                                                                                                                                    |
| BIND_DATA                      | RAW (2000)     | Bind data                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER         | Number of I/O bytes which can be filtered by the Exadata storage system<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                                           |
| IO_INTERCONNECT_BYTES          | NUMBER         | Number of I/O bytes exchanged between Oracle Database and the storage system                                                                                                                                                                                                                                                                                                                                                                    |
| PHYSICAL_READ_REQUESTS         | NUMBER         | Number of physical read I/O requests issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                |
| PHYSICAL_READ_BYTES            | NUMBER         | Number of bytes read from disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                            |
| PHYSICAL_WRITE_REQUESTS        | NUMBER         | Number of physical write I/O requests issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                               |
| PHYSICAL_WRITE_BYTES           | NUMBER         | Number of bytes written to disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                           |
| OPTIMIZED_PHY_READ_REQUESTS    | NUMBER         | Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                |
| LOCKED_TOTAL                   | NUMBER         | Total number of times the child cursor has been locked                                                                                                                                                                                                                                                                                                                                                                                          |
| PINNED_TOTAL                   | NUMBER         | Total number of times the child cursor has been pinned                                                                                                                                                                                                                                                                                                                                                                                          |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER         | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                          |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER         | Number of bytes that are returned by Exadata cell through the regular I/O path<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                                    |
| CON_ID                         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| Column                        | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS_REOPTIMIZABLE              | VARCHAR2(1) | This column shows whether the next execution matching this child cursor will trigger a reoptimization. The values are: <ul style="list-style-type: none"> <li>Y: If the next execution will trigger a reoptimization</li> <li>R: If the child cursor contains reoptimization information, but will not trigger reoptimization because the cursor was compiled in reporting mode</li> <li>N: If the child cursor has no reoptimization information</li> </ul>                                                                                                                               |
| IS_RESOLVED_ADAPTIVE_PLA<br>N | VARCHAR2(1) | This column shows whether all of the adaptive parts of a plan have been resolved to the final plan. Once the plan is resolved, the plan hash value and the plan displayed by DBMS_XPLAN will not change through the end of execution. The values for this column are: <ul style="list-style-type: none"> <li>NULL: If the plan is not adaptive</li> <li>Y: If the plan is fully resolved</li> <li>N: If the plan is not yet fully resolved</li> </ul> <p><b>See Also:</b> <i>Oracle Database PL/SQL Packages and Types Reference</i> for more information about the DBMS_XPLAN package</p> |

## 10.88 V\$SQLAREA\_PLAN\_HASH

V\$SQLAREA\_PLAN\_HASH displays statistics on shared SQL areas (V\$SQL) by grouping on the SQL\_ID and PLAN\_HASH\_VALUE columns. It can potentially create several rows for one parent cursor, one for each distinct value of the column PLAN\_HASH\_VALUE.

| Column          | Datatype       | Description                                                                                                                                                                                                          |
|-----------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT        | VARCHAR2(1000) | First thousand characters of the SQL text for the current cursor                                                                                                                                                     |
| SQL_FULLTEXT    | CLOB           | All characters of the SQL text for the current cursor                                                                                                                                                                |
| ADDRESS         | RAW(4   8)     | Address of the handle to the parent for this cursor                                                                                                                                                                  |
| HASH_VALUE      | NUMBER         | Hash value of the parent statement in the library cache                                                                                                                                                              |
| SQL_ID          | VARCHAR2(13)   | SQL identifier of the parent cursor in the library cache                                                                                                                                                             |
| PLAN_HASH_VALUE | NUMBER         | Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). |

| Column                        | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VERSION_COUNT                 | NUMBER      | Number of child cursors that are present in the cache under this parent                                                                                                                                                                                                                                                                                                                                                                                                             |
| LAST_ACTIVE_CHILD_ADDRES<br>S | RAW (4   8) | Address (identifier) of the child cursor that was the last to be active in the group (that is, the child cursor on behalf of which statistics in V\$SQL were updated)                                                                                                                                                                                                                                                                                                               |
| SHARABLE_MEM                  | NUMBER      | Amount of shared memory used by a cursor. If multiple child cursors exist, then it is the sum of all shared memory used by all child cursors.                                                                                                                                                                                                                                                                                                                                       |
| PERSISTENT_MEM                | NUMBER      | Fixed amount of memory used for the lifetime of an open cursor. If multiple child cursors exist, then it is the fixed sum of memory used for the lifetime of all the child cursors.                                                                                                                                                                                                                                                                                                 |
| RUNTIME_MEM                   | NUMBER      | Fixed amount of memory required during execution of a cursor. If multiple child cursors exist, then the fixed sum of all memory required during execution of all the child cursors.                                                                                                                                                                                                                                                                                                 |
| SORTS                         | NUMBER      | Sum of the number of sorts that were done for all the child cursors                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LOADED_VERSIONS               | NUMBER      | Number of child cursors that are present in the cache and that have their context heap loaded                                                                                                                                                                                                                                                                                                                                                                                       |
| OPEN_VERSIONS                 | NUMBER      | Number of child cursors that are currently open under this parent                                                                                                                                                                                                                                                                                                                                                                                                                   |
| USERS_OPENING                 | NUMBER      | Number of users that have any of the child cursors open                                                                                                                                                                                                                                                                                                                                                                                                                             |
| USERS_EXECUTING               | NUMBER      | Total number of users executing the statement over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                |
| FETCHES                       | NUMBER      | Number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXECUTIONS                    | NUMBER      | Total number of executions, totalled over all the child cursors                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PX_SERVERS_EXECUTIONS         | NUMBER      | Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)                                                                                                                                                                                                                                                                                                                                                       |
| END_OF_FETCH_COUNT            | NUMBER      | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column. |
| LOADS                         | NUMBER      | Number of times the object was loaded or reloaded                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| FIRST_LOAD_TIME               | DATE        | Timestamp of the parent creation time                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LAST_LOAD_TIME                | DATE        | Time at which the query plan was loaded into the library cache                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LAST_ACTIVE_TIME              | DATE        | Time at which the query plan was last active                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_EXEC_START_TIME          | DATE        | Time at which the most recent execution of this SQL started                                                                                                                                                                                                                                                                                                                                                                                                                         |
| INVALIDATIONS                 | NUMBER      | Total number of invalidations over all the child cursors                                                                                                                                                                                                                                                                                                                                                                                                                            |
| PARSE_CALLS                   | NUMBER      | Sum of all parse calls to all the child cursors under this parent                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DISK_READS                    | NUMBER      | Sum of the number of disk reads over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                              |
| DIRECT_WRITES                 | NUMBER      | Sum of the number of direct writes over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                           |
| BUFFER_GETS                   | NUMBER      | Sum of buffer gets over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CPU_TIME                      | NUMBER      | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                                                                                                                                 |
| ELAPSED_TIME                  | NUMBER      | Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                                                                                                                             |
| APPLICATION_WAIT_TIME         | NUMBER      | Application wait time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CONCURRENCY_WAIT_TIME         | NUMBER      | Concurrency wait time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CLUSTER_WAIT_TIME             | NUMBER      | Cluster wait time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |

| ROWS_PROCESSED           | NUMBER         | Total number of rows processed on behalf of this SQL statement                                                                                                                                                                                                                                                                                                                                                                |
| COMMAND_TYPE             | NUMBER         | Oracle command type definition                                                                                                                                                                                                                                                                                                                                                                                                |
| OPTIMIZER_MODE           | VARCHAR2 (10)  | Mode under which the SQL statement was executed                                                                                                                                                                                                                                                                                                                                                                               |
| OPTIMIZER_COST           | NUMBER         | Cost of this query given by the optimizer                                                                                                                                                                                                                                                                                                                                                                                     |
| OPTIMIZER_ENV            | RAW (2000)     | Optimizer environment                                                                                                                                                                                                                                                                                                                                                                                                         |
| OPTIMIZER_ENV_HASH_VALUE | NUMBER         | Hash value for the optimizer environment                                                                                                                                                                                                                                                                                                                                                                                      |
| PARSING_USER_ID          | NUMBER         | User ID of the user that has parsed the very first cursor under this parent                                                                                                                                                                                                                                                                                                                                                   |
| PARSING_SCHEMA_ID        | NUMBER         | Schema ID that was used to parse this child cursor                                                                                                                                                                                                                                                                                                                                                                            |
| PARSING_SCHEMA_NAME      | VARCHAR2 (128) | Schema name that was used to parse this child cursor                                                                                                                                                                                                                                                                                                                                                                          |
| KEPT_VERSIONS            | NUMBER         | Number of child cursors that have been marked to be kept using the DBMS_SHARED_POOL package                                                                                                                                                                                                                                                                                                                                   |
| MODULE                   | VARCHAR2 (64)  | Contains the name of the module that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_MODULE                                                                                                                                                                                                                                                                                 |
| MODULE_HASH              | NUMBER         | Hash value of the module that is named in the MODULE column                                                                                                                                                                                                                                                                                                                                                                   |
| ACTION                   | VARCHAR2 (64)  | Contains the name of the action that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_ACTION                                                                                                                                                                                                                                                                                 |
| ACTION_HASH              | NUMBER         | Hash value of the action that is named in the ACTION column                                                                                                                                                                                                                                                                                                                                                                   |
| SERIALIZABLE_ABORTS      | NUMBER         | Number of times the transaction failed to serialize, producing ORA-08177 errors, totalled over all the child cursors                                                                                                                                                                                                                                                                                                          |
| OUTLINE_CATEGORY         | VARCHAR2 (64)  | If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise, the column is left blank.                                                                                                                                                                                                                                                                     |
| OUTLINE_SID              | VARCHAR2 (40)  | Outline session identifier                                                                                                                                                                                                                                                                                                                                                                                                    |
| REMOTE                   | VARCHAR2 (1)   | Indicates whether the cursor is remote mapped (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                  |
| OBJECT_STATUS            | VARCHAR2 (19)  | Status of the cursor: <ul style="list-style-type: none"> <li>VALID - Valid, authorized without errors</li> <li>VALID_AUTH_ERROR - Valid, authorized with authorization errors</li> <li>VALID_COMPILE_ERROR - Valid, authorized with compilation errors</li> <li>VALID_UNAUTH - Valid, unauthorized</li> <li>INVALID_UNAUTH - Invalid, unauthorized</li> <li>INVALID - Invalid, unauthorized but keep the timestamp</li> </ul> |
| LITERAL_HASH_VALUE       | NUMBER         | Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when CURSOR_SHARING is used. This is not the hash value for the SQL statement. If CURSOR_SHARING is not used, then the value is 0.                                                                                                                                                                                  |
| SQL_PROFILE              | VARCHAR2 (64)  | SQL profile used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                   |

This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.90 V\$SQLFN\_ARG\_METADATA

V\$SQLFN\_ARG\_METADATA contains metadata about function arguments. There is one row for each argument of every function found in V\$SQLFN\_METADATA. There are no rows for functions that do not have any arguments.

| Column   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FUNC_ID  | NUMBER         | Internal function identification number. This column can be used to join with the V\$SQLFN_METADATA view.                                                                                                                                                                                                                                                                                                                                   |
| ARGNUM   | NUMBER         | Argument number                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DATATYPE | VARCHAR2 (8)   | Data type of the argument. The value is NULL if this argument is not used. Otherwise, it can take values of any Oracle data type, family data type, or EXPR data type.                                                                                                                                                                                                                                                                      |
| DESCR    | VARCHAR2 (128) | This column is reserved for future use.                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID   | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.91 V\$SQLFN\_METADATA

V\$SQLFN\_METADATA contains metadata about operators and built-in functions. Note that this view does not contain information about arguments because the number of arguments will be different for various functions. Information about arguments is contained in V\$SQLFN\_ARG\_METADATA, which can be joined with V\$SQLFN\_METADATA to get information about any function and its arguments.

| Column      | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |

| OFFLOADABLE | VARCHAR2 (3)    | Indicates whether execution of the function can be offloaded to the Oracle Exadata Storage Server (YES) or not (NO)<br><br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                               |
| DISP_TYPE   | VARCHAR2 (13)   | Function display type: <ul style="list-style-type: none"><li>• NORMAL</li><li>• ARITHMETIC</li><li>• PARENTHESIS</li><li>• REL-OP</li><li>• CASELIKE</li><li>• NOPARENTHESIS</li></ul>                                                                                                                                                                                                                                              |
| USAGE       | VARCHAR2 (128)  | A text explanation of how to use this function. The text is based on the syntax diagram for the function in the <i>Oracle Database SQL Language Reference</i> .                                                                                                                                                                                                                                                                     |
| DESCR       | VARCHAR2 (4000) | Description of the function                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID      | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• n: Where n is the applicable container ID for the rows containing data</li></ul> |

## 10.92 V\$SQLSTATS

V\$SQLSTATS displays basic performance statistics for SQL cursors and contains one row per SQL statement (that is, one row per unique value of SQL\_ID). The column definitions for columns in V\$SQLSTATS are identical to those in the V\$SQL and V\$SQLAREA views. However, the V\$SQLSTATS view differs from V\$SQL and V\$SQLAREA in that it is faster, more scalable, and has a greater data retention (the statistics may still appear in this view, even after the cursor has been aged out of the shared pool). Note that V\$SQLSTATS contains a subset of columns that appear in V\$SQL and V\$SQLAREA.

| Column                        | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT                      | VARCHAR2(1000) | First thousand characters of the SQL text for the current cursor                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_FULLTEXT                  | CLOB           | Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V\$SQLTEXT view.                                                                                                                                                                                                                                                                                                          |
| SQL_ID                        | VARCHAR2(13)   | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                                                                                                                                                            |
| LAST_ACTIVE_TIME              | DATE           | Last time the statistics of a contributing cursor were updated                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LAST_ACTIVE_CHILD_ADDRES<br>S | RAW(4   8)     | Address of the contributing cursor that last updated these statistics                                                                                                                                                                                                                                                                                                                                                                                                               |
| PLAN_HASH_VALUE               | NUMBER         | Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).                                                                                                                                                                                                                                                                |
| PARSE_CALLS                   | NUMBER         | Number of parse calls for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DISK_READS                    | NUMBER         | Number of disk reads for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DIRECT_WRITES                 | NUMBER         | Number of direct writes for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DIRECT_READS                  | NUMBER         | Number of direct reads for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                  |
| BUFFER_GETS                   | NUMBER         | Number of buffer gets for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ROWS_PROCESSED                | NUMBER         | Total number of rows the parsed SQL statement returns                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SERIALIZABLE_ABORTS           | NUMBER         | Number of times the transaction failed to serialize, producing ORA-08177 errors, per cursor                                                                                                                                                                                                                                                                                                                                                                                         |
| FETCHES                       | NUMBER         | Number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXECUTIONS                    | NUMBER         | Number of executions that took place on this object since it was brought into the library cache                                                                                                                                                                                                                                                                                                                                                                                     |
| END_OF_FETCH_COUNT            | NUMBER         | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column. |
| LOADS                         | NUMBER         | Number of times the object was either loaded or reloaded                                                                                                                                                                                                                                                                                                                                                                                                                            |
| VERSION_COUNT                 | NUMBER         | number of cursors present in the cache with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                  |
| INVALIDATIONS                 | NUMBER         | Number of times this child cursor has been invalidated                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PX_SERVERS_EXECUTIONS         | NUMBER         | Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)                                                                                                                                                                                                                                                                                                                                                       |
| CPU_TIME                      | NUMBER         | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                                                                                                                                 |

| Column                         | Datatype | Description                                                                                                                                                                                                                                                                                      |
|--------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ELAPSED_TIME                   | NUMBER   | Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then <code>ELAPSED_TIME</code> is the cumulative time for the query coordinator, plus all parallel query worker processes.                                       |
| AVG_HARD_PARSE_TIME            | NUMBER   | Average hard parse time (in microseconds) used by this cursor                                                                                                                                                                                                                                    |
| APPLICATION_WAIT_TIME          | NUMBER   | Application wait time (in microseconds)                                                                                                                                                                                                                                                          |
| CONCURRENCY_WAIT_TIME          | NUMBER   | Concurrency wait time (in microseconds)                                                                                                                                                                                                                                                          |
| CLUSTER_WAIT_TIME              | NUMBER   | Cluster wait time (in microseconds). This value is specific to Oracle RAC. It shows the total time spent waiting for all waits that are categorized under the cluster class of wait events. The value in this column is an accumulated wait time spent waiting for Oracle RAC cluster resources. |
| USER_IO_WAIT_TIME              | NUMBER   | User I/O wait time (in microseconds)                                                                                                                                                                                                                                                             |
| PLSQL_EXEC_TIME                | NUMBER   | PL/SQL execution time (in microseconds)                                                                                                                                                                                                                                                          |
| JAVA_EXEC_TIME                 | NUMBER   | Java execution time (in microseconds)                                                                                                                                                                                                                                                            |
| SORTS                          | NUMBER   | Number of sorts that were done for the child cursor                                                                                                                                                                                                                                              |
| SHARABLE_MEM                   | NUMBER   | Total shared memory (in bytes) currently occupied by all cursors with this SQL text and plan                                                                                                                                                                                                     |
| TOTAL_SHARABLE_MEM             | NUMBER   | Total shared memory (in bytes) occupied by all cursors with this SQL text and plan if they were to be fully loaded in the shared pool (that is, cursor size)                                                                                                                                     |
| TYPECHECK_MEM                  | NUMBER   | Typecheck memory                                                                                                                                                                                                                                                                                 |
| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER   | Number of I/O bytes which can be filtered by the Exadata storage system<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                            |
| IO_INTERCONNECT_BYTES          | NUMBER   | Number of I/O bytes exchanged between Oracle Database and the storage system. Typically used for Cache Fusion or parallel queries.                                                                                                                                                               |
| PHYSICAL_READ_REQUESTS         | NUMBER   | Number of physical read I/O requests issued by the monitored SQL. The requests may not be disk reads.                                                                                                                                                                                            |
| PHYSICAL_READ_BYTES            | NUMBER   | Number of bytes read from disks by the monitored SQL                                                                                                                                                                                                                                             |
| PHYSICAL_WRITE_REQUESTS        | NUMBER   | Number of physical write I/O requests issued by the monitored SQL                                                                                                                                                                                                                                |
| PHYSICAL_WRITE_BYTES           | NUMBER   | Number of bytes written to disks by the monitored SQL                                                                                                                                                                                                                                            |
| EXACT_MATCHING_SIGNATURE       | NUMBER   | Signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>EXACT</code>                                                                                                                                                                                                       |
| FORCE_MATCHING_SIGNATURE       | NUMBER   | Signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>FORCE</code>                                                                                                                                                                                                       |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER   | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                           |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER   | Number of bytes that are returned by Exadata cell through the regular I/O path<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                     |
| DELTA_PARSE_CALLS              | NUMBER   | Number of parse calls for the cursor since the last Automatic Workload Repository (AWR) snapshot<br><b>See Also:</b> <i>Oracle Database Performance Tuning Guide</i> for an introduction to AWR                                                                                                  |

| Column                                                                                     | Datatype | Description                                                                                                                 |
|--------------------------------------------------------------------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------|
| DELTA_DISK_READS                                                                           | NUMBER   | Number of disk reads for the cursor since the last AWR snapshot                                                             |
| DELTA_DIRECT_WRITES                                                                        | NUMBER   | Number of direct writes for the cursor since the last AWR snapshot                                                          |
| DELTA_DIRECT_READS                                                                         | NUMBER   | Number of direct reads for the cursor since the last AWR snapshot                                                           |
| DELTA_BUFFER_GETS                                                                          | NUMBER   | Number of buffer gets for the cursor since the last AWR snapshot                                                            |

## 10.93 V\$SQLSTATS\_PLAN\_HASH

V\$SQLSTATS\_PLAN\_HASH displays basic performance statistics for SQL cursors and contains one row per execution plan of a SQL statement (that is, one row per unique combination of SQL\_ID and PLAN\_HASH\_VALUE).

The columns for V\$SQLSTATS\_PLAN\_HASH are the same as those for V\$SQLSTATS.

**See Also:**

"V\$SQLSTATS"

## 10.94 V\$SQLTEXT

V\$SQLTEXT displays the text of SQL statements belonging to shared SQL cursors in the SGA.

| Column     | Datatype    | Description                                               |
|------------|-------------|-----------------------------------------------------------|
| ADDRESS    | RAW (4   8) | Used with HASH_VALUE to uniquely identify a cached cursor |
| HASH_VALUE | NUMBER      | Used with ADDRESS to uniquely identify a cached cursor    |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_ID       | VARCHAR2 (13) | SQL identifier of a cached cursor                                                                                                                                                                                                                                                                                                                                                                                                           |
| COMMAND_TYPE | NUMBER        | Code for the type of SQL statement (SELECT, INSERT, and so on)                                                                                                                                                                                                                                                                                                                                                                              |
| PIECE        | NUMBER        | Number used to order the pieces of SQL text                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_TEXT     | VARCHAR2 (64) | A column containing one piece of the SQL text                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.95 V\$SQLTEXT\_WITH\_NEWLINES

V\$SQLTEXT\_WITH\_NEWLINES is identical to the V\$SQLTEXT view except that, to improve legibility, V\$SQLTEXT\_WITH\_NEWLINES does not replace newlines and tabs in the SQL statement with spaces.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS      | RAW (4   8)   | Used with HASH_VALUE to uniquely identify a cached cursor                                                                                                                                                                                                                                                                                                                                                                                   |
| HASH_VALUE   | NUMBER        | Used with ADDRESS to uniquely identify a cached cursor                                                                                                                                                                                                                                                                                                                                                                                      |
| SQL_ID       | VARCHAR2 (13) | SQL identifier of a cached cursor                                                                                                                                                                                                                                                                                                                                                                                                           |
| COMMAND_TYPE | NUMBER        | Code for the type of SQL statement (SELECT, INSERT, and so on)                                                                                                                                                                                                                                                                                                                                                                              |
| PIECE        | NUMBER        | Number used to order the pieces of SQL text                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_TEXT     | VARCHAR2 (64) | A column containing one piece of the SQL text                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. ## 10.96 V\$STANDBY\_EVENT\_HISTOGRAM

V\$STANDBY\_EVENT\_HISTOGRAM displays the histogram of apply lag on the physical standby. Each distinct value of apply lag has its own bucket and the count in the corresponding bucket

represents the number of occurrences so far. The physical standby samples the apply lag every second and increments the corresponding bucket in the histogram.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME              | VARCHAR2 (64) | Name of the event (currently <code>APPLY LAG</code> is the only valid value)                                                                                                                                                                                                                                                                                                                                                                    |
| TIME              | NUMBER        | Time duration that the bucket represents                                                                                                                                                                                                                                                                                                                                                                                                        |
| UNIT              | VARCHAR2 (16) | Time unit (seconds, minutes, hours, or days)                                                                                                                                                                                                                                                                                                                                                                                                    |
| COUNT             | NUMBER        | Each row is a histogram bucket for apply lag. <code>COUNT</code> is the number of occurrences the apply lag falls into the histogram bucket.                                                                                                                                                                                                                                                                                                    |
| LAST_TIME_UPDATED | VARCHAR2 (20) | Last time the bucket was updated by an event falling into that time duration                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.97 V\$STANDBY\_LOG

`V$STANDBY_LOG` displays information about standby redo logs. Standby redo logs are similar to online redo logs, but standby redo logs are only used on a standby database that is receiving redo data from the primary database.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP#        | NUMBER        | Log group number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DBID          | VARCHAR2 (40) | Database ID of the primary database to which the standby redo logfile is assigned. If the standby redo logfile is unassigned, the value <code>UNASSIGNED</code> will be displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| THREAD#       | NUMBER        | Log thread number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SEQUENCE#     | NUMBER        | Log sequence number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| BYTES         | NUMBER        | Size of the log (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| BLOCKSIZE     | NUMBER        | Block size of the logfile (512 or 4096)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| USED          | NUMBER        | Number of bytes used in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ARCHIVED      | VARCHAR2 (3)  | Archive status (YES) or (NO). See the <code>STATUS</code> column for further details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| STATUS        | VARCHAR2 (10) | Log status: <ul style="list-style-type: none"> <li><code>UNASSIGNED</code> - If <code>ARCHIVED</code> is NO, then the standby redo log has been archived and is again available. If <code>ARCHIVED</code> is YES, then the standby redo log has never been used and is available.</li> <li><code>ACTIVE</code> - If <code>ARCHIVED</code> is NO, then the standby redo log is complete and waiting to be archived. If <code>ARCHIVED</code> is YES, then the standby redo log is currently being written to and is therefore not ready to be archived. For a given thread, there should be only one such log.</li> </ul> |
| FIRST_CHANGE# | NUMBER        | Lowest SCN in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| FIRST_TIME    | DATE          | Time of the first SCN in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NEXT_CHANGE# | NUMBER   | All redo records contained within this log will have an SCN lower than NEXT_CHANGE#. Only filled in once the log is complete. Also the lowest SCN of any redo record in the next log.                                                                                                                                                                                                                                                           |
| NEXT_TIME    | DATE     | All redo records contained within this log will have a timestamp lower than NEXT_TIME. Only filled in once the log is complete. Also the lowest timestamp of any redo record in the next log.                                                                                                                                                                                                                                                   |
| LAST_CHANGE# | NUMBER   | Redo in the standby redo log that recovery can possibly apply from the log has an SCN lower than LAST_CHANGE#                                                                                                                                                                                                                                                                                                                                   |
| LAST_TIME    | DATE     | Timestamp of LAST_CHANGE#                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.98 V\$STATISTICS\_LEVEL

V\$STATISTICS\_LEVEL displays the status of the statistics/advisories controlled by STATISTICS\_LEVEL.

| Column               | Datatype        | Description                                                                                                                                                                                                                                                     |
|----------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTICS_NAME      | VARCHAR2 (64)   | Name of the statistic/advisory                                                                                                                                                                                                                                  |
| DESCRIPTION          | VARCHAR2 (4000) | Description of the statistic/advisory                                                                                                                                                                                                                           |
| SESSION_STATUS       | VARCHAR2 (8)    | Status of the statistic/advisory for the session: <ul style="list-style-type: none"> <li>ENABLED</li> <li>DISABLED</li> </ul>                                                                                                                                   |
| SYSTEM_STATUS        | VARCHAR2 (8)    | System-wide status of the statistic/advisory: <ul style="list-style-type: none"> <li>ENABLED</li> <li>DISABLED</li> </ul>                                                                                                                                       |
| ACTIVATION_LEVEL     | VARCHAR2 (7)    | Indicates the level of STATISTICS_LEVEL that enables the statistic/advisory: <ul style="list-style-type: none"> <li>BASIC</li> <li>TYPICAL</li> <li>ALL</li> </ul>                                                                                              |
| STATISTICS_VIEW_NAME | VARCHAR2 (64)   | If there is a single view externalizing the statistic/advisory, then this column contains the name of that view. If there is no such view, then this column is null. If there are multiple views involved, then the DESCRIPTION column mentions the view names. |
| SESSION_SETTABLE     | VARCHAR2 (3)    | Indicates whether the statistic/advisory can be set at the session level (YES) or not (NO)                                                                                                                                                                      |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.99 V\$STATNAME

V\$STATNAME displays decoded statistic names for the statistics shown in the V\$SESSTAT and V\$SYSSTAT tables.

On some platforms, the NAME and CLASS columns contain additional operating system-specific statistics.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                |
|--------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTIC#   | NUMBER        | Statistic number<br><b>Note:</b> Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.                                                                                                                                      |
| NAME         | VARCHAR2 (64) | Statistic name. Names that appear in this column remain stable across Oracle Database releases, and they can be relied on by customer scripts.                                                                                                                                                                                                             |
| CLASS        | NUMBER        | A number representing one or more statistics classes. The following class numbers are additive: <ul style="list-style-type: none"><li>• 1 - User</li><li>• 2 - Redo</li><li>• 4 - Enqueue</li><li>• 8 - Cache</li><li>• 16 - OS</li><li>• 32 - Real Application Clusters</li><li>• 64 - SQL</li><li>• 128 - Debug</li><li>• 256 - Instance level</li></ul> |
| STAT_ID      | NUMBER        | Identifier of the statistic                                                                                                                                                                                                                                                                                                                                |
| DISPLAY_NAME | VARCHAR2 (64) | A clearer and more descriptive name for the statistic that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.                                                                |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.100 V\$STATS\_ADVISOR\_RULES

V\$STATS\_ADVISOR\_RULES displays the rule definition information for each Optimizer Statistics Advisor rule.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RULE_ID     | NUMBER        | ID of the rule                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| NAME        | VARCHAR2 (64) | Name of the rule                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| RULE_TYPE   | VARCHAR2 (9)  | Type of the rule: <ul style="list-style-type: none"><li>• OBJECT</li><li>• OPERATION</li><li>• SYSTEM</li></ul>                                                                                                                                                                                                                                                                                                                                   |
| DESCRIPTION | VARCHAR2 (64) | Description of the rule                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.101 V\$STREAMS\_APPLY\_COORDINATOR

V\$STREAMS\_APPLY\_COORDINATOR displays information about each apply process coordinator. The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process, outbound server, or inbound server.

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                           |
|--------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                      | NUMBER         | Session ID of the coordinator's session                                                                                                                                                                                                                                                                               |
| SERIAL#                  | NUMBER         | Serial number of the coordinator's session                                                                                                                                                                                                                                                                            |
| STATE                    | VARCHAR2 (21)  | State of the coordinator: <ul style="list-style-type: none"> <li>INITIALIZING - Starting up</li> <li>IDLE - Performing no work</li> <li>APPLYING - Passing transactions to apply servers</li> <li>SHUTTING DOWN CLEANLY - Stopping without an error</li> <li>ABORTING - Stopping because of an apply error</li> </ul> |
| APPLY#                   | NUMBER         | Apply process number. An apply process coordinator is an Oracle background process, prefixed by ap.                                                                                                                                                                                                                   |
| APPLY_NAME               | VARCHAR2 (128) | Name of the apply process                                                                                                                                                                                                                                                                                             |
| TOTAL_APPLIED            | NUMBER         | Total number of transactions applied by the apply process since the apply process was last started                                                                                                                                                                                                                    |
| TOTAL_WAIT_DEPS          | NUMBER         | Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions                                                                        |
| TOTAL_WAIT_COMMITS       | NUMBER         | Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits                                                                                                                                  |
| TOTAL_ADMIN              | NUMBER         | Number of administrative jobs issued since the apply process was last started                                                                                                                                                                                                                                         |
| TOTAL_ASSIGNED           | NUMBER         | Number of transactions assigned to apply servers since the apply process was last started                                                                                                                                                                                                                             |
| TOTAL_RECEIVED           | NUMBER         | Total number of transactions received by the coordinator process since the apply process was last started                                                                                                                                                                                                             |
| TOTAL_IGNORED            | NUMBER         | Number of transactions which were received by the coordinator but were ignored because they had been previously applied                                                                                                                                                                                               |
| TOTAL_ROLLBACKS          | NUMBER         | Number of transactions which were rolled back due to unexpected contention                                                                                                                                                                                                                                            |
| TOTAL_ERRORS             | NUMBER         | Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started                                                                                                                                                                                          |
| UNASSIGNED_COMPLETE_TXNS | NUMBER         | Total number of complete transactions that the coordinator has not assigned to any apply servers                                                                                                                                                                                                                      |
| AUTO_TXN_BUFFER_SIZE     | NUMBER         | Current value of transaction buffer size. Transaction buffer size refers to the number of transactions that the apply reader can assemble ahead of apply servers. The apply process periodically adjusts the transaction buffer size.                                                                                 |
| LWM_TIME                 | DATE           | Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.                                                                                                                                                    |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.                                                                                                                                                                              |
| LWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.                                                                                                                                                                                          |
| HWM_TIME                 | DATE     | Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.                                                                                                                                                                                                                                                                            |
| HWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.                                                                                                                                                                                                                                                                                |
| HWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.                                                                                                                                                                                        |
| STARTUP_TIME             | DATE     | Time when the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                    |
| ELAPSED_SCHEDULE_TIME    | NUMBER   | Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_IDLE_TIME        | NUMBER   | Elapsed idle time                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LWM_POSITION             | RAW (64) | Position of the low-watermark LCR                                                                                                                                                                                                                                                                                                                                                                                                               |
| HWM_POSITION             | RAW (64) | Position of the high-watermark LCR                                                                                                                                                                                                                                                                                                                                                                                                              |
| PROCESSED_MESSAGE_NUMBER | NUMBER   | Message number currently processed by the apply coordinator                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| ACTIVE_SERVER_COUNT      | NUMBER   | Active server count                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

## 10.102 V\$STREAMS\_APPLY\_READER

V\$STREAMS\_APPLY\_READER displays information about each apply reader. The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process, outbound server, or inbound server.

| Column                       | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                          | NUMBER         | Session ID of the reader's session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SERIAL#                      | NUMBER         | Serial number of the reader's session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| APPLY#                       | NUMBER         | Apply process number. An apply process is an Oracle background process, prefixed by <code>ap</code> .                                                                                                                                                                                                                                                                                                                                                                                                                             |
| APPLY_NAME                   | VARCHAR2 (128) | Name of the apply process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STATE                        | VARCHAR2 (36)  | State of the reader: <ul style="list-style-type: none"> <li>INITIALIZING - Starting up</li> <li>IDLE - Performing no work</li> <li>DEQUEUE MESSAGES - Dequeuing messages from the queue</li> <li>SCHEDULE MESSAGES - Computing dependencies between messages and assembling messages into transactions</li> <li>SPILLING - Spilling unapplied messages from memory to hard disk</li> <li>PAUSED - WAITING FOR DDL TO COMPLETE - Waiting for a data definition language (DDL) logical change record (LCR) to be applied</li> </ul> |
| TOTAL_MESSAGES_DEQUEUED      | NUMBER         | Total number of messages dequeued since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TOTAL_MESSAGES_SPILLED       | NUMBER         | Number of messages spilled by the reader since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| OLDEST_XIDSLT          | NUMBER         | Transaction ID slot number of the oldest transaction that either has been applied or is being applied                                                                                                                                                                                                                                                                                                                                           |
| OLDEST_XIDSQN          | NUMBER         | Transaction ID sequence number of the oldest transaction that either has been applied or is being applied                                                                                                                                                                                                                                                                                                                                       |
| SPILL_LWM_SCN          | NUMBER         | Spill low-watermark SCN                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PROXY_SID              | NUMBER         | When the apply process uses combined capture and apply, the session ID of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                                                                                                                                                                                 |
| PROXY_SERIAL           | NUMBER         | When the apply process uses combined capture and apply, the serial number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                                                                                                                                                                              |
| PROXY_SPID             | VARCHAR2 (12)  | When the apply process uses combined capture and apply, the process identification number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                                                                                                                                                              |
| CAPTURE_BYTES_RECEIVED | NUMBER         | When the apply process uses combined capture and apply, the number of bytes received by the apply process from the capture process since the apply process last started. If the apply process does not use combined capture and apply, then this column is not populated.                                                                                                                                                                       |
| DEQUEUED_POSITION      | RAW (64)       | Dequeued position. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                                                         |
| LAST_BROWSE_POSITION   | RAW (64)       | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                       |
| OLDEST_POSITION        | RAW (64)       | The earliest position of the transactions currently being dequeued and applied. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                            |
| SPILL_LWM_POSITION     | RAW (64)       | Spill low-watermark position. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                                              |
| OLDEST_TRANSACTION_ID  | VARCHAR2 (128) | Oldest transaction ID                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_LCRS_WITH_DEP    | NUMBER         | Total number of LCRs with row-level dependencies since the apply process last started                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_LCRS_WITH_WMDEP  | NUMBER         | Total number of LCRs with watermark dependencies since the apply process last started.<br>A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.                                                                                                                                                                                                                 |
| TOTAL_IN_MEMORY_LCRS   | NUMBER         | Total number of LCRs currently in memory                                                                                                                                                                                                                                                                                                                                                                                                        |
| SGA_ALLOCATED          | NUMBER         | The total amount of shared memory (in bytes) allocated from the Streams pool for the apply process since the apply process last started                                                                                                                                                                                                                                                                                                         |
| CON_ID                 | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note:**

The `ELAPSED_DEQUEUE_TIME` and `ELAPSED_SCHEDULE_TIME` columns are only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

## 10.103 V\$STREAMS\_APPLY\_SERVER

`V$STREAMS_APPLY_SERVER` displays information about each apply server and its activities. An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process, outbound server, or inbound server.

| Column                  | Datatype                    | Description                                                                                           |
|-------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------|
| <code>SID</code>        | <code>NUMBER</code>         | Session ID of the apply server's session                                                              |
| <code>SERIAL#</code>    | <code>NUMBER</code>         | Serial number of the apply server's session                                                           |
| <code>APPLY#</code>     | <code>NUMBER</code>         | Apply process number. An apply process is an Oracle background process, prefixed by <code>ap</code> . |
| <code>APPLY_NAME</code> | <code>VARCHAR2 (128)</code> | Name of the apply process                                                                             |
| <code>SERVER_ID</code>  | <code>NUMBER</code>         | Parallel execution server number of the apply server                                                  |

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| APPLIED_MESSAGE_CREATE_TIME | DATE           | Creation time at the source database of the last captured message applied. No information about user-enqueued messages is recorded in this column.                                                                                                                                                                                                                                                                                              |
| ELAPSED_DEQUEUE_TIME        | NUMBER         | Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                            |
| ELAPSED_APPLY_TIME          | NUMBER         | Time elapsed (in hundredths of a second) applying messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                             |
| COMMIT_POSITION             | RAW (64)       | Commit position of the transaction. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.                                                                                                                                                                                                                                                                                     |
| DEP_COMMIT_POSITION         | RAW (64)       | Commit position of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                  |
| LAST_APPLY_POSITION         | RAW (64)       | For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.                                                                                                                                                           |
| TRANSACTION_ID              | VARCHAR2 (128) | Transaction ID that the worker is applying. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                                |
| DEP_TRANSACTION_ID          | VARCHAR2 (128) | Transaction ID of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                   |
| CON_ID                      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| TOTAL_LCRS_RETRIED          | NUMBER         | Total number of LCRs retried by this server                                                                                                                                                                                                                                                                                                                                                                                                     |
| LCR_RETRY_ITERATION         | NUMBER         | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RETRIED          | NUMBER         | Total transactions retried by this server                                                                                                                                                                                                                                                                                                                                                                                                       |
| TXN_RETRY_ITERATION         | NUMBER         | Total retry iterations by this server                                                                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_TXNS_RECORDED         | NUMBER         | Total transactions recorded in error queue by this server                                                                                                                                                                                                                                                                                                                                                                                       |

**Note:**

The `ELAPSED_DEQUEUE_TIME` and `ELAPSED_APPLY_TIME` columns are only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

## 10.104 V\$STREAMS\_POOL\_ADVICE

`V$STREAMS_POOL_ADVICE` displays information about the estimated count of spilled or unspilled messages and the associated time spent in the spill or unspill activity for different Streams pool sizes. The sizes range from 10% to 200% of the current Streams pool size, in equal intervals. The value of the interval depends on the current size of the Streams pool.

| Column                                      | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>STREAMS_POOL_SIZE_FOR_ESTIMATE</code> | NUMBER   | Streams pool size (in megabytes) for the estimate. The size ranges from values smaller than the current Streams pool size to values larger than the current Streams pool size, and there is a separate row for each increment. There is always an entry that shows the current Streams pool size, and there are always 20 increments. The range and the size of the increments depend on the current size of the Streams pool.                        |
| <code>STREAMS_POOL_SIZE_FACTOR</code>       | NUMBER   | Size factor with respect to the current Streams pool size                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>ESTD_SPILL_COUNT</code>               | NUMBER   | Estimated count of messages spilled from the Streams pool                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>ESTD_SPILL_TIME</code>                | NUMBER   | Estimated elapsed time (in seconds) to spill                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>ESTD_UNSPILL_COUNT</code>             | NUMBER   | Estimated count of unspills (read back from disk)                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>ESTD_UNSPILL_TIME</code>              | NUMBER   | Estimated elapsed time (in seconds) to unspill                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>CON_ID</code>                         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.105 V\$STREAMS\_POOL\_STATISTICS

`V$STREAMS_POOL_STATISTICS` displays information about the current Streams pool usage percentage.

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_MEMORY_ALLOCATED | NUMBER   | Total memory allocated to the Streams pool (in bytes). It should always be less than the current size of the Streams pool. You can get the percentage of the Streams pool used by dividing <code>TOTAL_MEMORY_ALLOCATED</code> by <code>CURRENT_SIZE</code> .                                                                                                                                                                                   |
| CURRENT_SIZE           | NUMBER   | Current size of the Streams pool (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                     |
| SGA_TARGET_VALUE       | NUMBER   | Value of <code>SGA_TARGET</code> . Used to determine whether or not streams pool automatic tuning is enabled. This should be set even if <code>MEMORY_TARGET</code> is set and <code>SGA_TARGET</code> is not set.                                                                                                                                                                                                                              |
| SHRINK_PHASE           | NUMBER   | This only pertains to the Streams pool in an automatic tuning environment ( <code>SGA_TARGET</code> and <code>MEMORY_TARGET</code> set). In this case, this shows whether or not the Streams pool is being asked to shrink. During the shrink phase, enqueues are blocked, flow control is enabled for all components, and cached memory is returned to the SGA.                                                                                |
| ADVICE_DISABLED        | NUMBER   | This determines whether or not Streams pool advice in <code>V\$STREAMS_POOL_ADVICE</code> as well as all statistics gathering related to auto-tuning the Streams pool have been disabled.                                                                                                                                                                                                                                                       |
| CON_ID                 | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.106 V\$SUBCACHE

`V$SUBCACHE` displays information about the subordinate caches currently loaded into library cache memory. The view walks through the library cache, printing out a row for each loaded subordinate cache per library cache object.

| Column     | Datatype        | Description                                        |
|------------|-----------------|----------------------------------------------------|
| OWNER_NAME | VARCHAR2 (64)   | Owner of the object containing these cache entries |
| NAME       | VARCHAR2 (1000) | Object Name                                        |
| TYPE       | NUMBER          | Object Type                                        |
| HEAP_NUM   | NUMBER          | Heap number containing this subordinate cache      |
| CACHE_ID   | NUMBER          | Subordinate cache ID                               |
| CACHE_CNT  | NUMBER          | Number of entries for this cache in this object    |
| HEAP_SZ    | NUMBER          | Amount of extent space allocated to this heap      |
| HEAP_ALOC  | NUMBER          | Amount of extent space allocated from this heap    |
| HEAP_USED  | NUMBER          | Amount of space utilized in this heap              |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.107 V\$SUBSCR\_REGISTRATION\_STATS

V\$SUBSCR\_REGISTRATION\_STATS displays information for diagnosability of notifications.

| Column                   | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| TOTAL_PENDING_NTFN_BYTES | NUMBER                      | Total number of bytes for notifications pending to be sent                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                   | NUMBER                      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.108 V\$SYS\_OPTIMIZER\_ENV

V\$SYS\_OPTIMIZER\_ENV displays the contents of the optimizer environment for the instance. The optimizer environment stores the value of the main parameters used by the Oracle optimizer when building the execution plan of a SQL statement. Hence, modifying the value of one or more of these parameters (for example, by issuing an ALTER SYSTEM statement) could lead to plan changes.

The parameters displayed by this view are either regular initialization parameters (such as OPTIMIZER\_FEATURES\_ENABLE) or pseudo parameters (such as ACTIVE\_INSTANCE\_COUNT).

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID            | NUMBER        | Unique identifier of the parameter in the optimizer environment                                                                                                                                                                                                                                                                                                                                                               |
| NAME          | VARCHAR2 (40) | Name of the parameter                                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_FEATURE   | VARCHAR2 (64) | Associated feature control ID                                                                                                                                                                                                                                                                                                                                                                                                 |
| ISDEFAULT     | VARCHAR2 (3)  | Indicates whether the parameter is set to the default value (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                 |
| VALUE         | VARCHAR2 (25) | Value of the parameter                                                                                                                                                                                                                                                                                                                                                                                                        |
| DEFAULT_VALUE | VARCHAR2 (25) | Default value of the parameter                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li>n: Where n is the applicable container ID for the rows containing data</li></ul> |

## 10.109 V\$SYS\_TIME\_MODEL

V\$SYS\_TIME\_MODEL displays the system-wide accumulated times for various operations. The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.

The time values are 8-byte integers and can therefore hold approximately 580,000 years worth of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

| Column  | Datatype | Description                                 |
|---------|----------|---------------------------------------------|
| STAT_ID | NUMBER   | Statistic identifier for the time statistic |

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STAT_NAME | VARCHAR2 (64) | Name of the statistic (see <a href="#">Table 10-1</a> )                                                                                                                                                                                                                                                                                                                                                                                     |
| VALUE     | NUMBER        | Amount of time (in microseconds) that the system has spent in this operation                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

**Note:**

This view returns instance-wide data and a value of 0 in the CON\_ID column when queried from the root of a CDB.

## 10.110 V\$SYSAUX\_OCCUPANTS

V\$SYSAUX\_OCCUPANTS displays SYSAUX tablespace occupant information.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |

This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.111 V\$SYSMETRIC

V\$SYSMETRIC displays the system metric values captured for the most current time interval for both the long duration (60-second) and short duration (15-second) system metrics.

| Column     | Datatype | Description                |
|------------|----------|----------------------------|
| BEGIN_TIME | DATE     | Begin time of the interval |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                            |
|--------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| END_TIME     | DATE          | End time of the interval                                                                                                                                                                                                                                                                                                                               |
| INTSIZE_CSEC | NUMBER        | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                              |
| GROUP_ID     | NUMBER        | Metric group ID                                                                                                                                                                                                                                                                                                                                        |
| METRIC_ID    | NUMBER        | Metric ID                                                                                                                                                                                                                                                                                                                                              |
| METRIC_NAME  | VARCHAR2 (64) | Metric name                                                                                                                                                                                                                                                                                                                                            |
| VALUE        | NUMBER        | Metric value                                                                                                                                                                                                                                                                                                                                           |
| METRIC_UNIT  | VARCHAR2 (64) | Metric unit description                                                                                                                                                                                                                                                                                                                                |

## 10.112 V\$SYSMETRIC\_HISTORY

V\$SYSMETRIC\_HISTORY displays all system metric values available in the database. Both long duration (60-second with 1 hour history) and short duration (15-second with one-interval only) metrics are displayed by this view.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                            |
