## 10.113 V\$SYSMETRIC\_SUMMARY

V\$SYSMETRIC\_SUMMARY displays a summary of all system metric values for the long-duration system metrics. The average, maximum value, minimum value, and the value of one standard deviation for the last hour are displayed for each metric item.

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                |
|--------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME         | DATE          | Begin time of the interval                                                                                                                                                                                                                                                                                                                                 |

## 10.114 V\$SYSSTAT

V\$SYSSTAT displays system statistics. To find the name of the statistic associated with each statistic number (STATISTIC#), query the V\$STATNAME view.

| Column     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTIC# | NUMBER        | Statistic number<br><b>Note:</b> Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.                                                                                                                                                                                                                             |
| NAME       | VARCHAR2 (64) | Statistic name. You can get a complete listing of statistic names by querying the V\$STATNAME view.                                                                                                                                                                                                                                                                                                                                               |
| CLASS      | NUMBER        | A number representing one or more statistics class. The following class numbers are additive: <ul style="list-style-type: none"><li>• 1 - User</li><li>• 2 - Redo</li><li>• 4 - Enqueue</li><li>• 8 - Cache</li><li>• 16 - OS</li><li>• 32 - Real Application Clusters</li><li>• 64 - SQL</li><li>• 128 - Debug</li><li>• 256 - Instance level</li></ul>                                                                                          |
| VALUE      | NUMBER        | Statistic value                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STAT_ID    | NUMBER        | Identifier of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID     | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

### Note:

This view returns instance-wide data and a value of 0 in the CON\_ID column when queried from the root of a CDB.

## 10.116 V\$SYSTEM\_EVENT

V\$SYSTEM\_EVENT displays information on total waits for an event. Note that the `TIME_WAITED` and `AVERAGE_WAIT` columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you want this column to reflect true wait times, then you must set `TIMED_STATISTICS` to `TRUE` in the parameter file; doing this will have a small negative effect on system performance.

**See Also:**

| CPU                  | NUMBER        | Total amount of CPU time consumed while implementing the wait event itself (in microseconds)                                                                                                                                                                                                                                                                                                                                                    |
| TOTAL_WAITS_FG       | NUMBER        | Total number of waits for the event, from foreground sessions                                                                                                                                                                                                                                                                                                                                                                                   |
| TOTAL_TIMEOUTS_FG    | NUMBER        | Total number of timeouts for the event, from foreground sessions                                                                                                                                                                                                                                                                                                                                                                                |
| TIME_WAITED_FG       | NUMBER        | Total amount of time waited for the event, from foreground sessions (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                 |
| AVERAGE_WAIT_FG      | NUMBER        | Average amount of time waited for the event, from foreground sessions (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                               |
| TIME_WAITED_MICRO_FG | NUMBER        | Total amount of time waited for the event, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                                                           |
| CPU_FG               | NUMBER        | Total amount of CPU time consumed while implementing the wait event itself, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                          |
| EVENT_ID             | NUMBER        | Identifier of the wait event                                                                                                                                                                                                                                                                                                                                                                                                                    |
| WAIT_CLASS_ID        | NUMBER        | Identifier of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                  |
| WAIT_CLASS#          | NUMBER        | Number of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                      |
| WAIT_CLASS           | VARCHAR2 (64) | Name of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note:**

This view returns instance-wide data and a value of 0 in the CON\_ID column when queried from the root of a CDB.

## 10.117 V\$SYSTEM\_FIX\_CONTROL

V\$SYSTEM\_FIX\_CONTROL displays information about Fix Control (enabled/disabled) at the system level.

| Column                   | Datatype      | Description                                                |
|--------------------------|---------------|------------------------------------------------------------|
| BUGNO                    | NUMBER        | Bug number (as fix control identifier)                     |
| VALUE                    | NUMBER        | Current value set for the fix control                      |
| SQL_FEATURE              | VARCHAR2 (64) | Feature control ID                                         |
| DESCRIPTION              | VARCHAR2 (64) | Description of the fix control                             |
| OPTIMIZER_FEATURE_ENABLE | VARCHAR2 (25) | Version on (and after) which the fix is enabled by default |
| EVENT                    | NUMBER        | Event formerly used to control this fix                    |

| Column     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS_DEFAULT | NUMBER   | Indicates whether the current value is the same as the default (1) or not (0)                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID     | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.118 V\$SYSTEM\_PARAMETER

V\$SYSTEM\_PARAMETER displays information about the initialization parameters that are currently in effect for the instance. A new session inherits parameter values from the instance-wide values.

| Column           | Datatype        | Description                                                                                                                                                                                                                                                                                              |
|------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM              | NUMBER          | Parameter number                                                                                                                                                                                                                                                                                         |
| NAME             | VARCHAR2 (80)   | Name of the parameter                                                                                                                                                                                                                                                                                    |
| TYPE             | NUMBER          | <p>Parameter type:</p> <ul style="list-style-type: none"> <li>1 - Boolean</li> <li>2 - String</li> <li>3 - Integer</li> <li>4 - Parameter file</li> <li>5 - Reserved</li> <li>6 - Big integer</li> </ul>                                                                                                 |
| VALUE            | VARCHAR2 (4000) | Instance-wide parameter value                                                                                                                                                                                                                                                                            |
| DISPLAY_VALUE    | VARCHAR2 (4000) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.                                                                                                                  |
| DEFAULT_VALUE    | VARCHAR2 (255)  | The default value for this parameter. This is the value of the parameter if a value is not explicitly specified for the parameter.                                                                                                                                                                       |
| ISDEFAULT        | VARCHAR2 (9)    | <p>Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE)</p> <p>The database sets the value of the ISDEFAULT column to TRUE for parameters that are not specified in the init.ora or server parameter file (SPFILE).</p> |
| ISSES_MODIFIABLE | VARCHAR2 (5)    | Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)                                                                                                                                                                                                                  |

| Column                | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISSYS_MODIFIABLE      | VARCHAR2 (9)   | <p>Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect:</p> <ul style="list-style-type: none"> <li>IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately.</li> <li>DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions.</li> <li>FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.</li> </ul> |

"V\$PARAMETER" for information about initialization parameters that are currently in effect for a session

## 10.119 V\$SYSTEM\_PARAMETER2

V\$SYSTEM\_PARAMETER2 displays information about the initialization parameters that are currently in effect for the instance, with each list parameter value appearing as a row in the view. A new session inherits parameter values from the instance-wide values.

Presenting the list parameter values in this format enables you to quickly determine the values for a list parameter. For example, if a parameter value is a, b, then the V\$SYSTEM\_PARAMETER view does not tell you if the parameter has two values (both a and b) or one value (a, b).

V\$SYSTEM\_PARAMETER2 makes the distinction between the list parameter values clear.

| NUM                   | NUMBER          | Parameter number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| NAME                  | VARCHAR2 (80)   | Name of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TYPE                  | NUMBER          | Parameter type: <ul style="list-style-type: none"> <li>1 - Boolean</li> <li>2 - String</li> <li>3 - Integer</li> <li>4 - Parameter file</li> <li>5 - Reserved</li> <li>6 - Big integer</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| VALUE                 | VARCHAR2 (4000) | Parameter value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| DISPLAY_VALUE         | VARCHAR2 (4000) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ISDEFAULT             | VARCHAR2 (6)    | Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ISSES_MODIFIABLE      | VARCHAR2 (5)    | Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ISSYS_MODIFIABLE      | VARCHAR2 (9)    | Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: <ul style="list-style-type: none"> <li>IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately.</li> <li>DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions.</li> <li>FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.</li> </ul> |
| ISPDB_MODIFIABLE      | VARCHAR2 (5)    | Indicates whether the parameter can be modified on a per-PDB basis (TRUE) or not (FALSE).<br>In a non-CDB, the value of this column is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ISINSTANCE_MODIFIABLE | VARCHAR2 (5)    | For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.                                                                                                                                                                                                                                                                                                                                                          |
| ISMODIFIED            | VARCHAR2 (8)    | Indicates how the parameter was modified. If an ALTER SYSTEM was performed, the value will be MODIFIED.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Column         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISADJUSTED     | VARCHAR2 (5)   | Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)                                                                                                                                                                                                                     |
| ISDEPRECATED   | VARCHAR2 (5)   | Indicates whether the parameter has been deprecated ( <b>TRUE</b> ) or not ( <b>FALSE</b> )                                                                                                                                                                                                                                                                                                                                                     |
| ISBASIC        | VARCHAR2 (5)   | Indicates whether the parameter is a basic parameter ( <b>TRUE</b> ) or not ( <b>FALSE</b> )                                                                                                                                                                                                                                                                                                                                                    |
| DESCRIPTION    | VARCHAR2 (255) | Description of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ORDINAL        | NUMBER         | Position (ordinal number) of the parameter value. Useful only for parameters whose values are lists of strings.                                                                                                                                                                                                                                                                                                                                 |
| UPDATE_COMMENT | VARCHAR2 (255) | Comments associated with the most recent update                                                                                                                                                                                                                                                                                                                                                                                                 |
| HASH           | NUMBER         | Hash value for the parameter name                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.120 V\$SYSTEM\_WAIT\_CLASS

V\$SYSTEM\_WAIT\_CLASS displays the instance-wide time totals for each registered wait class.

| Column            | Datatype      | Description                                                                                                    |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------|
| WAIT_CLASS_ID     | NUMBER        | Identifier of the wait class                                                                                   |
| WAIT_CLASS#       | NUMBER        | Number of the wait class                                                                                       |
| WAIT_CLASS        | VARCHAR2 (64) | Name of the wait class                                                                                         |
| TOTAL_WAITS       | NUMBER        | Total number of waits from this wait class                                                                     |
| TIME_WAITED       | NUMBER        | Total amount of time spent in waits from this wait class (in hundredths of a second)                           |
| TIME_WAITED_MICRO | NUMBER        | Total amount of time spent in waits from this wait class (in microseconds)                                     |
| CPU               | NUMBER        | Total amount of CPU time consumed while implementing waits from this wait class (in microseconds)              |
| TOTAL_WAITS_FG    | NUMBER        | Total number of waits for this wait class, from foreground sessions                                            |
| TIME_WAITED_FG    | NUMBER        | Total amount of time spent in waits from this wait class, from foreground sessions (in hundredths of a second) |

| Column               | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIME_WAITED_MICRO_FG | NUMBER   | Total amount of time spent in waits from this wait class, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                                              |
| CPU_FG               | NUMBER   | Total amount of CPU time consumed while implementing waits from this wait class, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                       |
| CON_ID               | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

**Note:**

This view returns instance-wide data and a value of 0 in the CON\_ID column when queried from the root of a CDB.

## 10.121 V\$TABLE\_ACCESS\_STATS

V\$TABLE\_ACCESS\_STATS displays the scan count for tables and partitions.

The scan data collection begins at instance startup.

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_ID          | NUMBER       | Object ID of the table or partition                                                                                                                                                                                                                                                                                                                                                                                                               |
| READ_COUNT         | NUMBER       | Aggregated scan count since instance startup                                                                                                                                                                                                                                                                                                                                                                                                      |
| LAST_ACCESSED_TIME | TIMESTAMP(0) | Date and time of the most recent scan                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID             | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

**Note:**

This view is available starting with Oracle Database 23ai.

## 10.122 V\$TABLESPACE

V\$TABLESPACE displays tablespace information from the control file.

| Column                      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TS#                         | NUMBER        | Tablespace number                                                                                                                                                                                                                                                                                                                                                                                                                               |
| NAME                        | VARCHAR2 (30) | Tablespace name                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| INCLUDED_IN_DATABASE_BACKUP | VARCHAR2 (3)  | Indicates whether the tablespace is included in full database backups using the <code>BACKUP DATABASE RMAN</code> command (YES) or not (NO); NO only if the <code>CONFIGURE EXCLUDE RMAN</code> command was used for this tablespace                                                                                                                                                                                                            |
| BIGFILE                     | VARCHAR2 (3)  | Indicates whether the tablespace is a bigfile tablespace (YES) or a smallfile tablespace (NO)                                                                                                                                                                                                                                                                                                                                                   |
| FLASHBACK_ON                | VARCHAR2 (3)  | Indicates whether the tablespace participates in <code>FLASHBACK DATABASE</code> operations (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                   |
| ENCRYPT_IN_BACKUP           | VARCHAR2 (3)  | Indicates whether encryption is turned ON or off at the tablespace level: <ul style="list-style-type: none"> <li>ON - Encryption is turned ON at the tablespace level</li> <li>OFF - Encryption is turned OFF at the tablespace level</li> <li>NULL - Encryption is neither explicitly turned on nor off at the tablespace level (default or when cleared)</li> </ul>                                                                           |
| CON_ID                      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.123 V\$TDM\_STATS

V\$TDM\_STATS describes statistics for Oracle Connection Manager in Traffic Director Mode (CMAN-TDM).

| Column                        | Datatype        | Description                                                                                                                                                        |
|-------------------------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CMAN_ID                       | VARCHAR2 (1024) | CMAN-TDM host name                                                                                                                                                 |
| GATEWAY_ID                    | NUMBER          | Index of the gateway process of CMAN-TDM                                                                                                                           |
| SERVICE_NAME                  | VARCHAR2 (1024) | Reserved for future use                                                                                                                                            |
| PRCP_NUM_REQUESTS             | NUMBER          | Number of client requests that resulted in acquire on the Proxy Resident Connection Pool (PRCP)                                                                    |
| PRCP_NUM_BUSY_CONNECTIONS     | NUMBER          | Number of busy server connections in the PRCP                                                                                                                      |
| PRCP_NUM_OPEN_CONNECTIONS     | NUMBER          | Number of busy and free server connections in the PRCP                                                                                                             |
| PRCP_HISTORIC_MAX_CONNECTIONS | NUMBER          | Maximum size (number of connections) that the PRCP has ever reached                                                                                                |
| PRCP_NUM_WAITS                | NUMBER          | Total number of client requests that waited due to unavailability of free server connections in the PRCP<br>This value accumulates since the start of the process. |
| PRCP_NUM_WAITS_ACTIVE         | NUMBER          | Number of active client requests currently waiting due to unavailability of free server connections in the PRCP                                                    |
| PRCP_NUM_HITS                 | NUMBER          | Total number of times that client requests found matches in the PRCP                                                                                               |

| Column                       | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRCP_NUM_INBOUND_CONNECTIONS | NUMBER                      | Total Number of active client connections for the PRCP                                                                                                                                                                                                                                                                                                                                                                                            |
| EDITION                      | VARCHAR2(1024)              | Database edition name associated with the PRCP                                                                                                                                                                                                                                                                                                                                                                                                    |
| UPDATED_TIME                 | TIMESTAMP(6) WITH TIME ZONE | Date and time at which the statistics were uploaded to the PDB                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID                       | NUMBER                      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

**Note:**

This view is available starting with Oracle Database 23ai.

## 10.124 V\$TEMP\_CACHE\_TRANSFER

V\$TEMP\_CACHE\_TRANSFER is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE\_CACHE\_TRANSFER and V\$SEGMENT\_STATISTICS views.

| Column                | Datatype | Description                                                                 |
|-----------------------|----------|-----------------------------------------------------------------------------|
| FILE_NUMBER           | NUMBER   | Number of the temp file                                                     |
| X_2_NULL              | NUMBER   | Number of blocks with Exclusive-to-NULL conversions; always 0               |
| X_2_NULL_FORCED_WRITE | NUMBER   | Number of Exclusive-to-NULL forced writes; always 0                         |
| X_2_NULL_FORCED_STALE | NUMBER   | Number of Exclusive-to-NULL blocks converted to CR; always 0                |
| X_2_S                 | NUMBER   | Number of blocks with Exclusive-to-Shared conversions; always 0             |
| X_2_S_FORCED_WRITE    | NUMBER   | Number of Exclusive-to-Shared forced writes; always 0                       |
| S_2_NULL              | NUMBER   | Number of blocks with Shared-to-NULL conversions; always 0                  |
| S_2_NULL_FORCED_STALE | NUMBER   | Number of Shared-to-NULL blocks converted to CR; always 0                   |
| RBR                   | NUMBER   | Number of reuse blocks cross-instance calls; always 0                       |
| RBR_FORCED_WRITE      | NUMBER   | Number of blocks written due to reuse blocks cross-instance calls; always 0 |
| NULL_2_X              | NUMBER   | Number of blocks with NULL-to-Exclusive conversions; always 0               |
| S_2_X                 | NUMBER   | Number of blocks with Shared-to-Exclusive conversions; always 0             |
| NULL_2_S              | NUMBER   | Number of blocks with NULL-to-Shared conversions; always 0                  |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.126 V\$TEMP\_EXTENT\_POOL

V\$TEMP\_EXTENT\_POOL displays the state of temporary space cached and used for the instance. Note that loading of the temporary space cache is lazy and that instances can be dormant.

| Column          | Datatype      | NULL     | Description            |
|-----------------|---------------|----------|------------------------|
| TABLESPACE_NAME | VARCHAR2 (30) | NOT NULL | Name of the tablespace |

| Column         | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 10.127 V\$TEMP\_SPACE\_HEADER

V\$TEMP\_SPACE\_HEADER displays aggregate information per file per LOCALLY MANAGED temporary tablespace regarding how much space is currently being used and how much is free as identified in the space header.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| CON_ID         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| SQL_ID_TEMPSEG | VARCHAR2 (13)  | SQL identifier of the SQL statement that created the temporary segment                                                                                                                                                                                                                                                                                                                                                                                |

## 10.131 V\$TEMPSTAT

V\$TEMPSTAT displays information about file read/write statistics.

| Column   | Datatype | Description                               |
|----------|----------|-------------------------------------------|
| FILE#    | NUMBER   | Number of the file                        |
| PHYRDS   | NUMBER   | Number of physical reads done             |
| PHYWRTS  | NUMBER   | Number of times DBWR is required to write |
| PHYBLKRD | NUMBER   | Number of physical blocks read            |

| Column         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PHYBLKWRT      | NUMBER   | Number of blocks written to disk, which may be the same as PHYWRTS if all writes are single blocks                                                                                                                                                                                                                                                                                                                                              |
| SINGLEBLKRDS   | NUMBER   | Number of single block reads                                                                                                                                                                                                                                                                                                                                                                                                                    |
| READTIM        | NUMBER   | Time (in hundredths of a second) spent doing reads if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                                        |
| WRITETIM       | NUMBER   | Time (in hundredths of a second) spent doing writes if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                                       |
| SINGLEBLKRDTIM | NUMBER   | Cumulative single block read time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                   |
| AVGIOTIM       | NUMBER   | Average time (in hundredths of a second) spent on I/O, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                                    |
| LSTIOTIM       | NUMBER   | Time (in hundredths of a second) spent doing the last I/O, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                                |
| MINIOTIM       | NUMBER   | Minimum time (in hundredths of a second) spent on a single I/O, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                           |
| MAXIORTM       | NUMBER   | Maximum time (in hundredths of a second) spent doing a single read, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                       |
| MAXIOWTM       | NUMBER   | Maximum time (in hundredths of a second) spent doing a single write, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                      |
| CON_ID         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.132 V\$TEMPUNDOSTAT

V\$TEMPUNDOSTAT shows various statistics related to the temporary undo log for this database instance. It displays a histogram of statistical data to show how the system is working. Each row in the view keeps statistics collected in the instance for a 10-minute interval. The rows are in the descending order of the BEGIN\_TIME column value. This view contains a total of 576 rows, spanning a 4-day cycle. This view is similar to the V\$UNDOSTAT view.

| Column     | Datatype | Description                                   |
|------------|----------|-----------------------------------------------|
| BEGIN_TIME | DATE     | Identifies the beginning of the time interval |
| END_TIME   | DATE     | Identifies the end of the time interval       |

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UNDOTSN        | NUMBER        | Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.                                                                                                                                                    |
| TXNCOUNT       | NUMBER        | Total number of transaction that have bound to the temp undo segment contained in above tablespace within the interval period                                                                                                                                                                                                                                                                                                                   |
| MAXCONCURRENCY | NUMBER        | Highest number of transactions executed concurrently which modified temporary objects within the interval period                                                                                                                                                                                                                                                                                                                                |
| MAXQUERYLEN    | NUMBER        | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                         |
| MAXQUERYID     | VARCHAR2 (13) | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                         |
| UNDOBLKCNT     | NUMBER        | Total number of temporary undo blocks consumed                                                                                                                                                                                                                                                                                                                                                                                                  |
| EXTCNT         | NUMBER        | Total number of extents consumed                                                                                                                                                                                                                                                                                                                                                                                                                |
| USCOUNT        | NUMBER        | Temp undo segments created in this period                                                                                                                                                                                                                                                                                                                                                                                                       |
| SSOLDERRCNT    | NUMBER        | Identifies the number of times the error ORA-01555 occurred. You can use this statistic to decide whether or not the <code>UNDO_RETENTION</code> initialization parameter is set properly given the size of the undo tablespace. Increasing the value of <code>UNDO_RETENTION</code> can reduce the occurrence of this error.                                                                                                                   |
| NOSPACEERRCNT  | NUMBER        | Total number of times the error 'no space left for temporary undo' was raised                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID         | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.134 V\$THREAD

V\$THREAD displays thread information from the control file. This view does not return meaningful results on a physical standby database.

| Column  | Datatype     | Description                                                      |
|---------|--------------|------------------------------------------------------------------|
| THREAD# | NUMBER       | Thread number                                                    |
| STATUS  | VARCHAR2 (6) | Thread status (OPEN  CLOSED)                                     |
| ENABLED | VARCHAR2 (8) | Enabled status: DISABLED, (enabled) PRIVATE, or (enabled) PUBLIC |
| GROUPS  | NUMBER       | Number of log groups assigned to this thread                     |

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE            | VARCHAR2 (80) | Instance name, if available                                                                                                                                                                                                                                                                                                                                                                                                                       |
| OPEN_TIME           | DATE          | Last time the thread was opened                                                                                                                                                                                                                                                                                                                                                                                                                   |

| ALERT_REASON_ID   | NUMBER        | ID of the alert reason                                                                                                                                              |
| METRIC_VALUE_TYPE | NUMBER        | Metric value type                                                                                                                                                   |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.136 V\$TIMER

V\$TIMER displays the elapsed time in hundredths of a second. Time is measured since the beginning of the epoch, which is operating system specific, and wraps around to 0 again whenever the value overflows four bytes (roughly 497 days).

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HSECS  | NUMBER   | Elapsed time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.137 V\$TIMEZONE\_FILE

V\$TIMEZONE\_FILE describes the time zone file that is currently in use by the database.

| Column   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILENAME | VARCHAR2 (20) | Time zone file name                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VERSION  | NUMBER        | Time zone file version                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID   | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.138 V\$TIMEZONE\_NAMES

V\$TIMEZONE\_NAMES displays valid time zone names.

| Column   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TZNAME   | VARCHAR2 (64) | Time zone region (for example, US/Pacific)                                                                                                                                                                                                                                                                                                                                                                                                      |
| TZABBREV | VARCHAR2 (64) | Corresponding daylight abbreviation (for example, PDT)                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID   | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.139 V\$TOPLEVELCALL

V\$TOPLEVELCALL displays the mapping between Oracle top level calls and names.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOP_LEVEL_CALL#     | NUMBER        | Oracle top level call number                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TOP_LEVEL_CALL_NAME | VARCHAR2 (64) | Oracle top level call name                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID              | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.140 V\$TRANSACTION

V\$TRANSACTION lists the active transactions in the system.

| Column     | Datatype      | Description                             |
|------------|---------------|-----------------------------------------|
| ADDR       | RAW (4   8)   | Address of the transaction state object |
| XIDUSN     | NUMBER        | Undo segment number                     |
| XIDSLOT    | NUMBER        | Slot number                             |
| XIDSQN     | NUMBER        | Sequence number                         |
| UBAFIL     | NUMBER        | Undo block address (UBA) filenum        |
| UBABLK     | NUMBER        | UBA block number                        |
| UBASQN     | NUMBER        | UBA sequence number                     |
| UBAREC     | NUMBER        | UBA record number                       |
| STATUS     | VARCHAR2 (16) | Status                                  |
| START_TIME | VARCHAR2 (20) | Start time (wall clock)                 |
| START_SCNB | NUMBER        | Start system change number (SCN) base   |
| START_SCNW | NUMBER        | Start SCN wrap                          |

| Column                    | Datatype       | Description                                                                                                                                                                                                                                      |
|---------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| START_UEXT                | NUMBER         | Start extent number                                                                                                                                                                                                                              |

## 10.142 V\$TRANSPORTABLE\_PLATFORM

V\$TRANSPORTABLE\_PLATFORM displays all platforms that support cross-platform tablespace transport. Specifically, it lists all platforms supported by the RMAN CONVERT TABLESPACE command, along with the endianness of each platform.

| Column        | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| PLATFORM_ID   | NUMBER         | Platform identification number                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PLATFORM_NAME | VARCHAR2 (101) | Platform name                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ENDIAN_FORMAT | VARCHAR2 (14)  | Platform endian format: <ul style="list-style-type: none"><li>• Big</li><li>• Little</li><li>• UNKNOWN FORMAT</li></ul>                                                                                                                                                                                                                                                                                                                           |
| CON_ID        | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 10.143 V\$TRUE\_CACHE

V\$TRUE\_CACHE displays True Cache configuration information.

- When you query this view on a True Cache, it returns a single row of information about the primary database to which the True Cache is connected.
- When you query this view on a primary database, it returns one row of information for each True Cache that is connected to the primary database.

| Column       | Datatype | Description                                                                                                                                                                                                                      |
|--------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 10.144 V\$TSDP\_SUPPORTED\_FEATURE

V\$TSDP\_SUPPORTED\_FEATURE displays information about the features supported by Transparent Sensitive Data Protection (TSDP).

| Column        | Datatype        | Description                                                                                                                                                                                                    |
|---------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FEATURE_NAME  | VARCHAR2 (200)  | The name of the supported feature                                                                                                                                                                              |
| FUNCTIONALITY | VARCHAR2 (200)  | The functionality that is supported within the feature. If all of the functionality of the feature is supported, the value is ALL, otherwise the value will show the specific functionality that is supported. |
| COMMENT\$     | VARCHAR2 (4000) | More information regarding the support for the feature and the specific functionality                                                                                                                          |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.145 V\$TYPE\_SIZE

V\$TYPE\_SIZE displays the sizes of various database components for use in estimating data block capacity.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT   | VARCHAR2 (8)  | Component name, such as segment or buffer header                                                                                                                                                                                                                                                                                                                                                                                                |
| TYPE        | VARCHAR2 (8)  | Component type                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DESCRIPTION | VARCHAR2 (32) | Description of the component                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TYPE_SIZE   | NUMBER        | Size of the component                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.146 V\$UNDOSTAT

V\$UNDOSTAT displays a histogram of statistical data to show how well the system is working. The available statistics include undo space consumption, transaction concurrency, and length of queries executed in the instance. You can use this view to estimate the amount of undo space required for the current workload. Oracle uses this view to tune undo usage in the system. The view returns NULL values if the system is in manual undo management mode. Each row in the view keeps statistics collected in the instance for a 10-minute interval. The rows are in descending order by the BEGIN\_TIME column value. Each row belongs to the time interval marked by (BEGIN\_TIME, END\_TIME). Each column represents the data collected for the particular statistic in that time interval. The first row of the view contains statistics for the (partial) current time period. The view contains a total of 576 rows, spanning a 4 day cycle.

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME     | DATE          | Identifies the beginning of the time interval                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_TIME       | DATE          | Identifies the end of the time interval                                                                                                                                                                                                                                                                                                                                                                                                            |
| UNDOTSN        | NUMBER        | Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.                                                                                                                                                       |
| UNDOBLKS       | NUMBER        | Represents the total number of undo blocks consumed. You can use this column to obtain the consumption rate of undo blocks, and thereby estimate the size of the undo tablespace needed to handle the workload on your system.                                                                                                                                                                                                                     |
| TXNCOUNT       | NUMBER        | Identifies the total number of transactions executed within the period                                                                                                                                                                                                                                                                                                                                                                             |
| MAXQUERYLEN    | NUMBER        | Identifies the length of the longest query (in seconds) executed in the instance during the period. You can use this statistic to estimate the proper setting of the <code>UNDO_RETENTION</code> initialization parameter. The length of a query is measured from the cursor open time to the last fetch/execute time of the cursor. Only the length of those cursors that have been fetched/executed during the period are reflected in the view. |
| MAXQUERYID     | VARCHAR2 (13) | SQL identifier of the longest running SQL statement in the period                                                                                                                                                                                                                                                                                                                                                                                  |
| MAXCONCURRENCY | NUMBER        | Identifies the highest number of transactions executed concurrently within the period                                                                                                                                                                                                                                                                                                                                                              |
| UNXPSTEALCNT   | NUMBER        | Number of attempts to obtain undo space by stealing unexpired extents from other transactions                                                                                                                                                                                                                                                                                                                                                      |
| UNXPBLKRELCNT  | NUMBER        | Number of unexpired blocks removed from certain undo segments so they can be used by other transactions                                                                                                                                                                                                                                                                                                                                            |
| UNXPBLKREUCNT  | NUMBER        | Number of unexpired undo blocks reused by transactions                                                                                                                                                                                                                                                                                                                                                                                             |
| EXPSTEALCNT    | NUMBER        | Number of attempts to steal expired undo blocks from other undo segments                                                                                                                                                                                                                                                                                                                                                                           |
| EXPBLKRELCNT   | NUMBER        | Number of expired undo blocks stolen from other undo segments                                                                                                                                                                                                                                                                                                                                                                                      |
| EXPBLKREUCNT   | NUMBER        | Number of expired undo blocks reused within the same undo segments                                                                                                                                                                                                                                                                                                                                                                                 |
| SSOLDERRCNT    | NUMBER        | Identifies the number of times the error <code>ORA-01555</code> occurred. You can use this statistic to decide whether or not the <code>UNDO_RETENTION</code> initialization parameter is set properly given the size of the undo tablespace. Increasing the value of <code>UNDO_RETENTION</code> can reduce the occurrence of this error.                                                                                                         |
| NOSPACEERRCNT  | NUMBER        | Identifies the number of times space was requested in the undo tablespace and there was no free space available. That is, all of the space in the undo tablespace was in use by active transactions. The corrective action is to add more space to the undo tablespace.                                                                                                                                                                            |
| ACTIVEBLKS     | NUMBER        | Total number of blocks in the active extents of the undo tablespace for the instance at the sampled time in the period                                                                                                                                                                                                                                                                                                                             |
| UNEXPIREDBLKS  | NUMBER        | Total number of blocks in the unexpired extents of the undo tablespace for the instance at the sampled time in the period                                                                                                                                                                                                                                                                                                                          |
| EXPIREDBLKS    | NUMBER        | Total number of blocks in the expired extents of the undo tablespace for the instance at the sampled time in the period                                                                                                                                                                                                                                                                                                                            |

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TUNED_UNDORETENTION | NUMBER   | Amount of time (in seconds) for which undo will not be recycled from the time it was committed. At any point in time, the latest value of <code>TUNED_UNDORETENTION</code> is used to determine whether data committed at a particular time in the past can be recycled.<br><br>The value of this column is not meaningful on an Oracle Active Data Guard standby database instance, because the system does not tune this value on such instances. |
| CON_ID              | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>     |

## 10.147 V\$UNUSABLE\_BACKUPFILE\_DETAILS

`V$UNUSABLE_BACKUPFILE_DETAILS` displays information about all backup files (backup pieces, proxy copies, or copies) that are marked unavailable and expired. You can select one of the rows and use `BTYPE_KEY` or `FILETYPE_KEY` to change the status of a backup file set or a specific file to available.

| Column            | Datatype     | Description                                                                                                                                                               |
|-------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_KEY       | NUMBER       | Session identifier                                                                                                                                                        |
| SESSION_RECID     | NUMBER       | Session record ID                                                                                                                                                         |
| SESSION_STAMP     | NUMBER       | Session stamp                                                                                                                                                             |
| RMAN_STATUS_RECID | NUMBER       | Record ID of the corresponding row in the control file                                                                                                                    |
| RMAN_STATUS_STAMP | NUMBER       | Timestamp of the row in the controlfile                                                                                                                                   |
| BTYPE             | CHAR(9)      | Backup type container. Possible values are: <code>BACKUPSET</code> , <code>IMAGECOPY</code> , <code>PROXYCOPY</code> .                                                    |
| BTYPE_KEY         | NUMBER       | Unique identifier for the backup type, either <code>BS_KEY</code> or <code>COPY_KEY</code> .                                                                              |
| ID1               | NUMBER       | If <code>BACKUPSET</code> , it contains <code>SET_STAMP</code> .<br>If <code>IMAGECOPY</code> or <code>PROXYCOPY</code> , it is <code>RECID</code> from the control file. |
| ID2               | NUMBER       | If <code>BACKUPSET</code> , it contains <code>SET_COUNT</code> .<br>If <code>IMAGECOPY</code> or <code>PROXYCOPY</code> , it is <code>STAMP</code> .                      |
| FILETYPE          | VARCHAR2(15) | Type of file. Possible values are: <code>BACKUPPIECE</code> , <code>COPY</code> , <code>PROXYCOPY</code> .                                                                |
| FILETYPE_KEY      | NUMBER       | Backup piece key if the file is a backup piece; otherwise <code>COPY_KEY</code> .                                                                                         |
| STATUS            | VARCHAR2(1)  | Status of the backup file, either <code>U</code> (unavailable) or <code>X</code> (expired)                                                                                |
| FILESIZE          | NUMBER       | Size of the file                                                                                                                                                          |

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEVICE_TYPE | VARCHAR2 (17)  | Type of device on which the file resides                                                                                                                                                                                                                                                                                                                                                                                                        |
| FILENAME    | VARCHAR2 (513) | Name of the file                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MEDIA       | VARCHAR2 (65)  | Name of the media on which the copy resides. This value is informational only. It is not needed for restore.                                                                                                                                                                                                                                                                                                                                    |
| MEDIA_POOL  | NUMBER         | Media pool in which the copy resides. This is the same value that was entered in the <code>POOL</code> operand of the Recovery Manager <code>BACKUP</code> command.                                                                                                                                                                                                                                                                             |
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.148 V\$VERSION

`V$VERSION` displays the version number of Oracle Database. The database components have the same version number as the database, so the version number is returned only once.

| Column        | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BANNER        | VARCHAR2 (80)  | Component name and version number                                                                                                                                                                                                                                                                                                                                                                                                               |
| BANNER_FULL   | VARCHAR2 (160) | The new 2 line banner format introduced in Oracle Database 18c. The banner displays the database release and version number.                                                                                                                                                                                                                                                                                                                    |
| BANNER_LEGACY | VARCHAR2 (80)  | The legacy 1 line banner used before Oracle Database 18c. This column displays the same value as the <code>BANNER</code> column.                                                                                                                                                                                                                                                                                                                |
| CON_ID        | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.149 V\$VPD\_POLICY

`V$VPD_POLICY` displays all the fine-grained security policies and predicates associated with the cursors currently in the library cache.

| Column   | Datatype    | Description           |
|----------|-------------|-----------------------|
| ADDRESS  | RAW (4   8) | Cursor address        |
| PARADDR  | RAW (4   8) | Parent cursor address |
| SQL_HASH | NUMBER      | SQL hash number       |

| Column                | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_ID                | VARCHAR2 (13)   | SQL identifier                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CHILD_NUMBER          | NUMBER          | Cursor's child number under the parent                                                                                                                                                                                                                                                                                                                                                                                                          |
| OBJECT_OWNER          | VARCHAR2 (128)  | Owner of the object with the policy                                                                                                                                                                                                                                                                                                                                                                                                             |
| OBJECT_NAME           | VARCHAR2 (128)  | Name of the object with the policy                                                                                                                                                                                                                                                                                                                                                                                                              |
| POLICY_GROUP          | VARCHAR2 (128)  | Name of the policy group                                                                                                                                                                                                                                                                                                                                                                                                                        |
| POLICY                | VARCHAR2 (128)  | Name of the policy                                                                                                                                                                                                                                                                                                                                                                                                                              |
| POLICY_FUNCTION_OWNER | VARCHAR2 (128)  | Owner of the policy function                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PREDICATE             | VARCHAR2 (4000) | Predicate for the policy (truncated to 4000 bytes in length)                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID                | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.150 V\$WAIT\_CHAINS

V\$WAIT\_CHAINS displays information about blocked sessions. A wait chain is composed of sessions that are blocked by one another. Each row represents a blocked and blocker session pair. If a wait chain is not a cyclical wait chain, then the last row for the chain does not have a blocker.

| Column               | Datatype       | Description                                                                                                                   |
|----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| CHAIN_ID             | NUMBER         | A number identifying the wait chain                                                                                           |
| CHAIN_IS_CYCLE       | VARCHAR2 (5)   | Indicates whether the final blocked session in the wait chain is blocked by the initial blocked session (TRUE) or not (FALSE) |
| CHAIN_SIGNATURE      | VARCHAR2 (801) | An Oracle-specific text signature of the wait chain. This signature can be used to identify similar wait chains.              |
| CHAIN_SIGNATURE_HASH | NUMBER         | A numeric representation of CHAIN_SIGNATURE                                                                                   |
| INSTANCE             | NUMBER         | Blocked session's instance identifier                                                                                         |
| OSID                 | VARCHAR2 (25)  | Blocked session's operating system process identifier                                                                         |
| PID                  | NUMBER         | Blocked session's Oracle process identifier                                                                                   |
| SID                  | NUMBER         | Blocked session's Oracle session identifier                                                                                   |
| SESS_SERIAL#         | NUMBER         | Blocked session's Oracle session serial number                                                                                |
| PDB_ID               | NUMBER         | Blocked session's PDB identifier                                                                                              |

| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.151 V\$WAITCLASSMETRIC

V\$WAITCLASSMETRIC displays metric values of wait classes for the most recent 60-second interval. A history of the last one hour will be kept in the system.

| Column               | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| BEGIN_TIME           | DATE     | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                             |
| END_TIME             | DATE     | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                               |
| INTSIZE_CSEC         | NUMBER   | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                              |
| WAIT_CLASS#          | NUMBER   | Number of the class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                                  |
| WAIT_CLASS_ID        | NUMBER   | Identifier of the class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                              |
| AVERAGE_WAITER_COUNT | NUMBER   | Average waiter count                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DBTIME_IN_WAIT       | NUMBER   | Percent of database time spent in the wait                                                                                                                                                                                                                                                                                                                                                                                                             |
| TIME_WAITED          | NUMBER   | Time waited during the interval (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                            |
| WAIT_COUNT           | NUMBER   | Number of times waited                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TIME_WAITED_FG       | NUMBER   | Amount of time (in hundredths of a second) spent in waits from this wait class in foreground sessions                                                                                                                                                                                                                                                                                                                                                  |
| WAIT_COUNT_FG        | NUMBER   | Number of times foreground processes waited                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID               | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.152 V\$WAITCLASSMETRIC\_HISTORY

V\$WAITCLASSMETRIC\_HISTORY displays metric values of wait classes for all intervals in the last one hour.

The columns for V\$WAITCLASSMETRIC\_HISTORY are the same as those for V\$WAITCLASSMETRIC.

**See Also:**["V\\$WAITCLASSMETRIC"](#)

## 10.153 V\$WAITSTAT

V\$WAITSTAT displays block contention statistics. This table is only updated when timed statistics are enabled.

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLASS  | VARCHAR2 (18) | Class of the block                                                                                                                                                                                                                                                                                                                                                                                                                              |
| COUNT  | NUMBER        | Number of waits by this OPERATION for this CLASS of block                                                                                                                                                                                                                                                                                                                                                                                       |
| TIME   | NUMBER        | Sum of all wait times for all the waits by this OPERATION for this CLASS of block (in centiseconds)                                                                                                                                                                                                                                                                                                                                             |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.154 V\$WALLET

V\$WALLET displays metadata of certificates that may be used as a master key for Transparent Data Encryption.

**Note:**

The use of PKI encryption with Transparent Data Encryption is deprecated. To configure Transparent Data Encryption, use the `ADMINISTER KEY MANAGEMENT SQL` statement. See *Oracle Database Transparent Data Encryption Guide* for more information.

| Column     | Datatype       | Description                                                                                                  |
|------------|----------------|--------------------------------------------------------------------------------------------------------------|
| CERT_ID    | VARCHAR2 (52)  | A unique certificate identifier value used to specify a particular PKI certificate for use as the master key |
| DN         | VARCHAR2 (255) | Distinguished name of a particular PKI certificate                                                           |
| SERIAL_NUM | VARCHAR2 (40)  | Unique serial number assigned to a certificate by the issuer or signer                                       |
| ISSUER     | VARCHAR2 (255) | Distinguished name of the Certificate Authority or issuer that issued and signed the certificate             |
| KEYSIZE    | NUMBER         | Size of the PKI key associated with the certificate                                                          |

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS | VARCHAR2 (16) | Current status of the certificate: <ul style="list-style-type: none"> <li>• UNUSED</li> <li>• IN USE</li> <li>• USED</li> </ul> This column allows the user to identify whether a certificate is currently in use or has already been used for Transparent Data Encryption.                                                                                                                                                                           |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.155 V\$WORKLOAD\_REPLAY\_THREAD

V\$WORKLOAD\_REPLAY\_THREAD displays information for all the different types of replay sessions.

| Column          | Datatype       | Description                                                                            |
|-----------------|----------------|----------------------------------------------------------------------------------------|
| CLOCK           | NUMBER         | Current simulated SCN based on the SCN recorded at capture time                        |
| NEXT_TICKER     | NUMBER         | Next stream ID that will increment the <code>CLOCK</code> after a commit action        |
| SID             | NUMBER         | Session ID of the replay session                                                       |
| SERIAL#         | NUMBER         | Session serial number of the replay session                                            |
| SPID            | VARCHAR2 (24)  | The server process ID of the replay session                                            |
| LOGON_USER      | VARCHAR2 (128) | Logon username of the replay session                                                   |
| LOGON_TIME      | DATE           | Logon time of the replay session                                                       |
| EVENT           | VARCHAR2 (64)  | Event name                                                                             |
| EVENT_ID        | NUMBER         | Event identifier                                                                       |
| EVENT#          | NUMBER         | Event operation code                                                                   |
| P1TEXT          | VARCHAR2 (64)  | Text for event parameter 1                                                             |
| P1              | NUMBER         | Value of event parameter 1                                                             |
| P2TEXT          | VARCHAR2 (64)  | Text for event parameter 2                                                             |
| P2              | NUMBER         | Value of event parameter 2                                                             |
| P3TEXT          | VARCHAR2 (64)  | Text for event parameter 3                                                             |
| P3              | NUMBER         | Value of event parameter 3                                                             |
| WAIT_FOR_SCN    | NUMBER         | The captured SCN for which the current user call should wait                           |
| FILE_ID         | NUMBER         | The stream ID that is being replayed                                                   |
| CALL_COUNTER    | NUMBER         | The call counter of the user call that is being replayed                               |
| DEPENDENT_SCN   | NUMBER         | The dependent SCN, captured to order the commit actions using block-level dependencies |
| STATEMENT_SCN   | NUMBER         | Statement SCN                                                                          |
| COMMIT_WAIT_SCN | NUMBER         | The (maximum) SCN that the current commit should wait for                              |

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POST_COMMIT_SCN      | NUMBER        | The next SCN after the current commit                                                                                                                                                                                                                                                                                                                                                                                                           |
| ACTION_TYPE          | NUMBER        | The type of commits. The possible values are: COMMIT, ROLLBACK, FAKED_COMMIT, and NULL. A value of NULL means it is not a commit operation.                                                                                                                                                                                                                                                                                                     |
| SESSION_TYPE         | VARCHAR2 (13) | The type of replay session:<br>LOGON<br>ADMIN<br>DISPATCHER<br>REPLAY                                                                                                                                                                                                                                                                                                                                                                           |
| WRC_ID               | NUMBER        | Unique replay client ID assigned by the server to all participating replay clients when replay starts                                                                                                                                                                                                                                                                                                                                           |
| SCHEDULE_CAP_ID      | NUMBER        | An unique identifier for a workload capture added to a replay schedule. A value of 0 is used for a non-consolidated replay.                                                                                                                                                                                                                                                                                                                     |
| FILE_NAME            | VARCHAR2 (51) | File name of the captured stream                                                                                                                                                                                                                                                                                                                                                                                                                |
| SKIP_IT              | VARCHAR2 (1)  | Whether or not the current replayed user call is skipped or not                                                                                                                                                                                                                                                                                                                                                                                 |
| DIRTY_BUFFERS        | VARCHAR2 (1)  | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DBTIME               | NUMBER        | Accumulated database time for the replay session                                                                                                                                                                                                                                                                                                                                                                                                |
| NETWORK_TIME         | NUMBER        | Accumulated network time for the replay session                                                                                                                                                                                                                                                                                                                                                                                                 |
| THINK_TIME           | NUMBER        | Accumulated think time for the replay session                                                                                                                                                                                                                                                                                                                                                                                                   |
| TIME_GAIN            | NUMBER        | If nonzero, the accumulated time in macro seconds indicating how fast the replay is                                                                                                                                                                                                                                                                                                                                                             |
| TIME_LOSS            | NUMBER        | If nonzero, the accumulated time in macro seconds indicating how slow the replay is                                                                                                                                                                                                                                                                                                                                                             |
| USER_CALLS           | NUMBER        | Total number of user calls                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PLSQL_CALLS          | NUMBER        | Total number of PL/SQL calls recorded in the workload capture                                                                                                                                                                                                                                                                                                                                                                                   |
| PLSQL_SUBCALLS       | NUMBER        | Total number of calls recorded in the workload capture for SQL executed from PL/SQL                                                                                                                                                                                                                                                                                                                                                             |
| PLSQL_DBTIME         | NUMBER        | Total amount of database time in microseconds from PL/SQL calls that have been recorded in the workload capture                                                                                                                                                                                                                                                                                                                                 |
| CLIENT_OS_USER       | VARCHAR2 (15) | Operating system username of the replay client                                                                                                                                                                                                                                                                                                                                                                                                  |
| CLIENT_HOST          | VARCHAR2 (64) | Host name of the replay client                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CLIENT_PID           | VARCHAR2 (24) | Process ID of the replay client                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PROGRAM              | VARCHAR2 (84) | Program name of the replay client                                                                                                                                                                                                                                                                                                                                                                                                               |
| CAPTURE_ELAPSED_TIME | NUMBER        | Total amount of elapsed time of a session since capture starts (in seconds)                                                                                                                                                                                                                                                                                                                                                                     |
| REPLAY_ELAPSED_TIME  | NUMBER        | Total amount of elapsed time of a session since replay starts (in seconds)                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.156 V\$XML\_AUDIT\_TRAIL

V\$XML\_AUDIT\_TRAIL shows standard, fine-grained, SYS, and mandatory audit records written in XML format files.

### Note:

This view is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored and are viewable with this view. See *Oracle Database Security Guide* for more information about how this desupport works.

| Column             | Datatype                     | Description                                                                                                                                                                                 |
|--------------------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUDIT_TYPE         | NUMBER                       | Type of audit row: <ul style="list-style-type: none"> <li>1 = Standard XML Audit</li> <li>2 = Fine Grained XML Audit</li> <li>4 = SYS XML Audit</li> <li>8 = Mandatory XML Audit</li> </ul> |
| SESSION_ID         | NUMBER                       | Numeric ID for the Oracle session                                                                                                                                                           |
| PROXY_SESSIONID    | NUMBER                       | Proxy session serial number, if an enterprise user has logged in through a proxy mechanism                                                                                                  |
| STATEMENTID        | NUMBER                       | Numeric ID for the statement run (a statement may cause multiple audit records)                                                                                                             |
| ENTRYID            | NUMBER                       | Numeric ID for the audit trail entry in the session                                                                                                                                         |
| EXTENDED_TIMESTAMP | TIMESTAMP (6) WITH TIME ZONE | Timestamp of the audited operation (the timestamp of the user's logon for entries is created by AUDIT SESSION)                                                                              |
| GLOBAL_UID         | VARCHAR2 (32)                | Global user identifier for the user, if the user has logged in as an enterprise user                                                                                                        |
| DB_USER            | VARCHAR2 (128)               | Database username of the user whose actions were audited                                                                                                                                    |
| CLIENTIDENTIFIER   | VARCHAR2 (64)                | Client identifier in the Oracle session                                                                                                                                                     |
| EXT_NAME           | VARCHAR2 (1024)              | User's external name                                                                                                                                                                        |
| OS_USER            | VARCHAR2 (128)               | Operating system logon user name of the user whose actions were audited                                                                                                                     |
| OS_HOST            | VARCHAR2 (128)               | Client host system name                                                                                                                                                                     |
| OS_PROCESS         | VARCHAR2 (16)                | Operating system process identifier of the Oracle server process                                                                                                                            |
| TERMINAL           | VARCHAR2 (30)                | Identifier for the user's terminal                                                                                                                                                          |
| INSTANCE_NUMBER    | NUMBER                       | Instance number as specified by the INSTANCE_NUMBER initialization parameter                                                                                                                |
| OBJECT_SCHEMA      | VARCHAR2 (128)               | Owner of the audited object                                                                                                                                                                 |
| OBJECT_NAME        | VARCHAR2 (128)               | Name of the object affected by the action                                                                                                                                                   |
| POLICY_NAME        | VARCHAR2 (128)               | Name of the fine-grained auditing policy                                                                                                                                                    |
| NEW_OWNER          | VARCHAR2 (128)               | Owner of the object named in the NEW_NAME column                                                                                                                                            |
| NEW_NAME           | VARCHAR2 (128)               | New name of object after renaming, or the name of an underlying object (for example, CREATE INDEX owner.obj_name ON new_owner.new_name)                                                     |

| Column           | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTION           | NUMBER          | Numeric code for the action type                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STATEMENT_TYPE   | NUMBER          | Description of the action                                                                                                                                                                                                                                                                                                                                                                                                                                |
| TRANSACTIONID    | RAW (8)         | Identifier of the transaction in which the object is accessed or modified                                                                                                                                                                                                                                                                                                                                                                                |
| RETURNCODE       | NUMBER          | Oracle error code generated by the action. Zero if the action succeeded.                                                                                                                                                                                                                                                                                                                                                                                 |
| SCN              | NUMBER          | System change number (SCN) of the query                                                                                                                                                                                                                                                                                                                                                                                                                  |
| COMMENT_TEXT     | VARCHAR2 (4000) | Text comments on standard audit entries. Also indicates how the user was authenticated - the method can be one of the following: <ul style="list-style-type: none"> <li>DATABASE - authentication was done by password</li> <li>NETWORK - authentication was done by Oracle Net Services or the Advanced Networking Option</li> <li>PROXY - the client was authenticated by another user. The name of the proxy user follows the method type.</li> </ul> |
| AUTH_PRIVILEGES  | VARCHAR2 (32)   | Privileges granted and revoked in GRANT and REVOKE statements recorded for standard audit trail entry                                                                                                                                                                                                                                                                                                                                                    |
| GRANTEE          | VARCHAR2 (128)  | User who granted or revoked the privilege                                                                                                                                                                                                                                                                                                                                                                                                                |
| PRIV_USED        | NUMBER          | Numerical code of privileges, if any, used in the action                                                                                                                                                                                                                                                                                                                                                                                                 |
| SES_ACTIONS      | VARCHAR2 (16)   | Session summary for standard audit records. A string of 12 characters, one for each action type, in the following order: Alter, Audit, Comment, Delete, Grant, Index, Insert, Lock, Rename, Select, Update, Flashback. Values: - = None, S=Success, F=Failure, B=Both                                                                                                                                                                                    |
| OS_PRIVILEGE     | VARCHAR2 (7)    | This column is populated only for administrative authentication audit records. It contains the administrative privilege used (for example, SYSDBA, SYSOPER, NONE).<br>For all other types of audit records, the value of this column is null.                                                                                                                                                                                                            |
| ECONTEXT_ID      | VARCHAR2 (64)   | Application execution context identifier                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_BIND         | VARCHAR2 (4000) | List of bind variables used in the statement                                                                                                                                                                                                                                                                                                                                                                                                             |
| SQL_TEXT         | VARCHAR2 (4000) | The statement or command that triggered the audit event                                                                                                                                                                                                                                                                                                                                                                                                  |
| OBJ_EDITION_NAME | VARCHAR2 (128)  | Name of the edition containing the audited object                                                                                                                                                                                                                                                                                                                                                                                                        |
| DBID             | NUMBER          | Database identifier of the audited database                                                                                                                                                                                                                                                                                                                                                                                                              |
| RLS_INFO         | VARCHAR2 (4000) | Stores virtual private database (VPD) policy names and predicates separated by delimiter.<br>To format the output into individual rows, use the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATTRAIL_XML function.                                                                                                                                                                                                                                                    |
| CURRENT_USER     | VARCHAR2 (128)  | Effective user for the statement execution                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID           | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                        |

**Note:**

The `SQL_BIND` and `SQL_TEXT` columns are only populated if the `AUDIT_TRAIL` initialization parameter is set to `xml`, `extended` or if the `AUDIT_SYS_OPERATIONS` initialization parameter is set to `TRUE`.

## 10.157 V\$XSTREAM\_APPLY\_COORDINATOR

`V$XSTREAM_APPLY_COORDINATOR` displays information about each XStream apply process coordinator. The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process, outbound server, or inbound server.

| Column                          | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>SID</code>                | <code>NUMBER</code>         | Session ID of the coordinator's session                                                                                                                                                                                                                                                                                                                                                          |
| <code>SERIAL#</code>            | <code>NUMBER</code>         | Serial number of the coordinator's session                                                                                                                                                                                                                                                                                                                                                       |
| <code>STATE</code>              | <code>VARCHAR2 (21)</code>  | State of the coordinator: <ul style="list-style-type: none"> <li>• <code>INITIALIZING</code> - Starting up</li> <li>• <code>IDLE</code> - Performing no work</li> <li>• <code>APPLYING</code> - Passing transactions to apply servers</li> <li>• <code>SHUTTING DOWN CLEANLY</code> - Stopping without an error</li> <li>• <code>ABORTING</code> - Stopping because of an apply error</li> </ul> |
| <code>APPLY#</code>             | <code>NUMBER</code>         | Apply process number. An apply process coordinator is an Oracle background process, prefixed by <code>ap</code> .                                                                                                                                                                                                                                                                                |
| <code>APPLY_NAME</code>         | <code>VARCHAR2 (128)</code> | Name of the apply process                                                                                                                                                                                                                                                                                                                                                                        |
| <code>TOTAL_APPLIED</code>      | <code>NUMBER</code>         | Total number of transactions applied by the apply process since the apply process was last started                                                                                                                                                                                                                                                                                               |
| <code>TOTAL_WAIT_DEPS</code>    | <code>NUMBER</code>         | Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions                                                                                                                                                   |
| <code>TOTAL_WAIT_COMMITS</code> | <code>NUMBER</code>         | Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits                                                                                                                                                                                                             |
| <code>TOTAL_ADMIN</code>        | <code>NUMBER</code>         | Number of administrative jobs issued since the apply process was last started                                                                                                                                                                                                                                                                                                                    |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_ASSIGNED           | NUMBER   | Number of transactions assigned to apply servers since the apply process was last started                                                                                                                                                                                                                                                                                                                                                       |
| TOTAL_RECEIVED           | NUMBER   | Total number of transactions received by the coordinator process since the apply process was last started                                                                                                                                                                                                                                                                                                                                       |
| TOTAL_IGNORED            | NUMBER   | Number of transactions which were received by the coordinator but were ignored because they had been previously applied                                                                                                                                                                                                                                                                                                                         |
| TOTAL_ROLLBACKS          | NUMBER   | Number of transactions which were rolled back due to unexpected contention                                                                                                                                                                                                                                                                                                                                                                      |
| TOTAL_ERRORS             | NUMBER   | Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started                                                                                                                                                                                                                                                                                                                    |
| UNASSIGNED_COMPLETE_TXNS | NUMBER   | Total number of complete transactions that the coordinator has not assigned to any apply servers                                                                                                                                                                                                                                                                                                                                                |
| LWM_TIME                 | DATE     | Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.                                                                                                                                                                                                                                                                              |
| LWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.                                                                                                                                                                              |
| LWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.                                                                                                                                                                                          |
| HWM_TIME                 | DATE     | Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.                                                                                                                                                                                                                                                                            |

## 10.158 V\$XSTREAM\_APPLY\_READER

`V$XSTREAM_APPLY_READER` displays information about each XStream apply reader. The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process, outbound server, or inbound server.

| Column                               | Datatype                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <code>APPLY#</code>                  | <code>NUMBER</code>        | Apply process number. An apply process is an Oracle background process, prefixed by <code>ap</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>APPLY_NAME</code>              | <code>VARCHAR2(128)</code> | Name of the apply process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>STATE</code>                   | <code>VARCHAR2(36)</code>  | Shows the state of the apply reader and the hash server. The possible values include: <ul style="list-style-type: none"> <li>• <code>INITIALIZING</code> - Starting up</li> <li>• <code>IDLE</code> - Performing no work</li> <li>• <code>DEQUEUE_MESSAGES</code> - Dequeuing messages from the queue</li> <li>• <code>SCHEDULE_MESSAGES</code> - Computing dependencies between messages and assembling messages into transactions</li> <li>• <code>SPILLING</code> - Spilling unapplied messages from memory to hard disk</li> <li>• <code>PAUSED - WAITING FOR DDL TO COMPLETE</code> - Waiting for a data definition language (DDL) logical change record (LCR) to be applied</li> </ul> The state of the apply reader is displayed first, followed by the state of the hash server. A semicolon separates the apply reader state from the hash server state. |
| <code>TOTAL_MESSAGES_DEQUEUED</code> | <code>NUMBER</code>        | Total number of messages dequeued since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>TOTAL_MESSAGES_SPILLED</code>  | <code>NUMBER</code>        | Number of messages spilled by the reader since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>DEQUEUE_TIME</code>            | <code>DATE</code>          | Time when the last message was received                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>DEQUEUED_MESSAGE_NUMBER</code> | <code>NUMBER</code>        | Number of the last message received                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Column                       | Datatype      | Description                                                                                                                                                                                                                                                                        |
|------------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEQUEUED_MESSAGE_CREATE_TIME | DATE          | For captured messages, creation time at the source database of the last message received. For user-enqueued messages, time when the message was enqueued into the queue at the local database.                                                                                     |
| SGA_USED                     | NUMBER        | Amount (in bytes) of SGA memory used by the apply process since it was last started                                                                                                                                                                                                |
| ELAPSED_DEQUEUE_TIME         | NUMBER        | Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started                                                                                                                                                                               |
| ELAPSED_SCHEDULE_TIME        | NUMBER        | Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started. Scheduling includes computing dependencies between messages and assembling messages into transactions.                                                                      |
| ELAPSED_SPILL_TIME           | NUMBER        | Elapsed time (in hundredths of a second) spent spilling messages since the apply process was last started                                                                                                                                                                          |
| OLDEST_SCN_NUM               | NUMBER        | Oldest SCN                                                                                                                                                                                                                                                                         |
| OLDEST_XIDUSN                | NUMBER        | Transaction ID undo segment number of the oldest transaction that either has been applied or is being applied                                                                                                                                                                      |
| OLDEST_XIDSLT                | NUMBER        | Transaction ID slot number of the oldest transaction that either has been applied or is being applied                                                                                                                                                                              |
| OLDEST_XIDSQN                | NUMBER        | Transaction ID sequence number of the oldest transaction that either has been applied or is being applied                                                                                                                                                                          |
| SPILL_LWM_SCN                | NUMBER        | Spill low-watermark SCN                                                                                                                                                                                                                                                            |
| PROXY_SID                    | NUMBER        | When the apply process uses combined capture and apply, the session ID of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                    |
| PROXY_SERIAL                 | NUMBER        | When the apply process uses combined capture and apply, the serial number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                 |
| PROXY_SPID                   | VARCHAR2(12)  | When the apply process uses combined capture and apply, the process identification number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0. |
| BYTES_RECEIVED               | NUMBER        | When the apply process uses combined capture and apply, the number of bytes received by the apply process from the capture process since the apply process last started. If the apply process does not use combined capture and apply, then this column is not populated.          |
| DEQUEUED_POSITION            | RAW(64)       | Dequeued position. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                            |
| SPILL_LWM_POSITION           | RAW(64)       | Spill low-watermark position. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                 |
| OLDEST_TRANSACTION_ID        | VARCHAR2(128) | Oldest transaction ID                                                                                                                                                                                                                                                              |
| TOTAL_LCRS_WITH_DEP          | NUMBER        | Total number of LCRs with row-level dependencies since the apply process last started                                                                                                                                                                                              |
| TOTAL_LCRS_WITH_WMDEP        | NUMBER        | Total number of LCRs with watermark dependencies since the apply process last started.<br>A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.                                                    |
| TOTAL_IN_MEMORY_LCRS         | NUMBER        | Total number of LCRs currently in memory                                                                                                                                                                                                                                           |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SGA_ALLOCATED | NUMBER   | The total amount of shared memory (in bytes) allocated from the XStreams pool for the apply process since the apply process last started                                                                                                                                                                                                                                                                                                          |
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

**Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

**See Also:**

- ["TIMED\\_STATISTICS"](#)
- ["STATISTICS\\_LEVEL"](#)

## 10.159 V\$XSTREAM\_APPLY\_RECEIVER

`V$XSTREAM_APPLY_RECEIVER` displays information about the message receiver of the apply process. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when apply migrates to another instance, or when the XStream process is stopped.

| Column                   | Datatype       | Description                                                  |
|--------------------------|----------------|--------------------------------------------------------------|
| SID                      | NUMBER         | Session ID of the apply receiver                             |
| SERIAL#                  | NUMBER         | Serial number of the apply receiver                          |
| APPLY_NAME               | VARCHAR2 (128) | Name of the apply process                                    |
| STARTUP_TIME             | DATE           | Startup time of the apply process                            |
| SOURCE_DATABASE_NAME     | VARCHAR2 (128) | Name of the source database                                  |
| ACKNOWLEDGEMENT          | NUMBER         | Acknowledgement SCN of the messages received by the receiver |
| LAST_RECEIVED_MSG        | NUMBER         | Last received message                                        |
| TOTAL_MESSAGES_RECEIVED  | NUMBER         | Total number of messages received                            |
| TOTAL_AVAILABLE_MESSAGES | NUMBER         | Number of available messages                                 |

| Column                     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE                      | VARCHAR2 (44) | State of the apply receiver: <ul style="list-style-type: none"><li>• Initializing</li><li>• Sending unapplied txns</li><li>• Waiting for message from client</li><li>• Waiting for LCR from client</li><li>• Receiving LCRs</li><li>• Evaluating rules</li><li>• Enqueueing LCRS</li><li>• Waiting for memory</li><li>• Waiting for apply to read</li><li>• Waiting for client flush request to complete</li><li>• Waiting for client commit to complete</li></ul> |
| LAST_RECEIVED_MSG_POSITION | RAW (64)      | Last received message position                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ACKNOWLEDGEMENT_POSITION   | RAW (64)      | Acknowledgement position of the messages received by the receiver. Corresponds to <code>ACKNOWLEDGEMENT</code> , except the value is in position rather than SCN.                                                                                                                                                                                                                                                                                                  |
| CON_ID                     | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul>                  |

## 10.160 V\$XSTREAM\_APPLY\_SERVER

`V$XSTREAM_APPLY_SERVER` displays information about each XStream apply server and its activities. An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process, outbound server, or inbound server.

| Column     | Datatype       | Description                                                                                           |
|------------|----------------|-------------------------------------------------------------------------------------------------------|
| SID        | NUMBER         | Session ID of the apply server's session                                                              |
| SERIAL#    | NUMBER         | Serial number of the apply server's session                                                           |
| APPLY#     | NUMBER         | Apply process number. An apply process is an Oracle background process, prefixed by <code>ap</code> . |
| APPLY_NAME | VARCHAR2 (128) | Name of the apply process                                                                             |
| SERVER_ID  | NUMBER         | Parallel execution server number of the apply server                                                  |

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE            | VARCHAR2 (20) | <p>State of the apply server:</p> <ul style="list-style-type: none"> <li>INITIALIZING - Starting up</li> <li>IDLE - Performing no work</li> <li>RECORD LOW-WATERMARK - Performing an administrative job that maintains information about the apply progress, which is used in the ALL_APPLY_PROGRESS and DBA_APPLY_PROGRESS data dictionary views</li> <li>ADD PARTITION - Performing an administrative job that adds a partition that is used for recording information about in-progress transactions</li> <li>DROP PARTITION - Performing an administrative job that purges rows that were used to record information about in-progress transactions</li> <li>EXECUTE TRANSACTION - Applying a transaction</li> <li>WAIT COMMIT - Waiting to commit a transaction until all other transactions with a lower commit SCN are applied. This state is possible only if the COMMIT_SERIALIZATION apply process parameter is set to a value other than DEPENDENT_TRANSACTIONS and the PARALLELISM apply process parameter is set to a value greater than 1.</li> <li>WAIT DEPENDENCY - Waiting to apply a logical change record (LCR) in a transaction until another transaction, on which it has a dependency, is applied. This state is possible only if the PARALLELISM apply process parameter is set to a value greater than 1.</li> <li>ROLLBACK TRANSACTION - Rolling back a transaction</li> <li>TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the apply process's queue</li> <li>WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs</li> <li>WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction</li> </ul> |
| XIDUSN           | NUMBER        | Transaction ID undo segment number of the transaction currently being applied                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| APPLIED_MESSAGE_CREATE_TIME | DATE           | Creation time at the source database of the last captured message applied. No information about user-enqueued messages is recorded in this column.                                                                                                                                                                                                                                                                                              |
| ELAPSED_DEQUEUE_TIME        | NUMBER         | Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                            |
| ELAPSED_APPLY_TIME          | NUMBER         | Time elapsed (in hundredths of a second) applying messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                             |
| COMMIT_POSITION             | RAW (64)       | Commit position of the transaction. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                                        |
| DEP_COMMIT_POSITION         | RAW (64)       | Commit position of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                  |
| LAST_APPLY_POSITION         | RAW (64)       | For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.                                                                                                                                                           |
| TRANSACTION_ID              | VARCHAR2 (128) | Transaction ID that the worker is applying. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                                |
| DEP_TRANSACTION_ID          | VARCHAR2 (128) | Transaction ID of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                   |
| CON_ID                      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| TOTAL_LCRS_RETRIED          | NUMBER         | Total number of LCRs retried by this server                                                                                                                                                                                                                                                                                                                                                                                                     |
| LCR_RETRY_ITERATION         | NUMBER         | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RETRIED          | NUMBER         | Total transactions retried by this server                                                                                                                                                                                                                                                                                                                                                                                                       |
| TXN_RETRY_ITERATION         | NUMBER         | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RECORDED         | NUMBER         | Total transactions recorded in error queue by this server                                                                                                                                                                                                                                                                                                                                                                                       |

**Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

## 10.161 V\$XSTREAM\_CAPTURE

`V$XSTREAM_CAPTURE` displays information about each capture process that sends LCRs to an XStream outbound server.

| Column       | Datatype       | Description                                                                                           |
|--------------|----------------|-------------------------------------------------------------------------------------------------------|
| SID          | NUMBER         | Session identifier of the capture process                                                             |
| SERIAL#      | NUMBER         | Session serial number of the capture process session                                                  |
| CAPTURE#     | NUMBER         | Capture process number. A capture process is an Oracle background process prefixed by <code>cp</code> |
| CAPTURE_NAME | VARCHAR2 (128) | Name of the capture process                                                                           |
| LOGMINER_ID  | NUMBER         | Session ID of the Oracle LogMiner session associated with the capture process                         |
| STARTUP_TIME | DATE           | Time when the capture process was last started                                                        |

| Column                      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE                       | VARCHAR2 (551) | <p>State of the capture process:</p> <ul style="list-style-type: none"> <li>INITIALIZING - Starting up.</li> <li>WAITING FOR DICTIONARY REDO - Waiting for redo log files containing the dictionary build related to the first SCN to be added to the capture process session. A capture process cannot begin to scan the redo log files until all of the log files containing the dictionary build have been added.</li> <li>DICTIONARY INITIALIZATION - Processing a dictionary build.</li> <li>MINING (PROCESSED SCN = <i>scn_value</i>) - Mining a dictionary build at the SCN <i>scn_value</i>.</li> <li>LOADING (step <i>X</i> of <i>Y</i>) - Processing information from a dictionary build and currently at step <i>X</i> in a process that involves <i>Y</i> steps, where <i>X</i> and <i>Y</i> are numbers.</li> <li>CAPTURING CHANGES - Scanning the redo log for changes that satisfy the capture process rule sets.</li> <li>WAITING FOR REDO - Waiting for new redo log files to be added to the capture process session. The capture process has finished processing all of the redo log files added to its session. This state is possible if there is no activity at a source database. For a downstream capture process, this state is possible if the capture process is waiting for new log files to be added to its session.</li> <li>EVALUATING RULE - Evaluating a change against a capture process rule set.</li> <li>CREATING LCR - Converting a change into an LCR.</li> <li>ENQUEUEING MESSAGE - Enqueueing an LCR that satisfies the capture process rule sets into the capture process queue.</li> <li>PAUSED FOR FLOW CONTROL - Unable to enqueue LCRs either because of low memory or because propagations and outbound servers are consuming messages slower than the capture process is creating them. This state indicates flow control that is used to reduce spilling of captured LCRs when propagation or apply has fallen behind or is unavailable.</li> <li>WAITING FOR THE BUFFERED QUEUE TO SHRINK - Waiting for the buffered queue to change to a smaller size. The buffered queue shrinks when there is a memory limitation or when an administrator reduces its size.</li> <li>WAITING FOR <i>n</i> SUBSCRIBER(S) INITIALIZING - Waiting for outbound servers that receive LCRs from the capture process to start, where <i>n</i> is the number of apply processes.</li> <li>WAITING FOR TRANSACTION - Waiting for LogMiner to provide more transactions.</li> <li>WAITING FOR INACTIVE DEQUEUEUS - Waiting for the capture process's queue subscribers to start. The capture process stops enqueueing LCRs if there are no active subscribers to the queue.</li> <li>SUSPENDED FOR AUTO SPLIT/MERGE - Waiting for a merge operation to complete.</li> <li>SHUTTING DOWN - Stopping.</li> <li>ABORTING - Terminating.</li> </ul> |
| TOTAL_PREFILTER_DISCARDED   | NUMBER         | Total number of prefiltered messages discarded                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Column                        | Datatype      | Description                                                                                                                                                                                                                                                                                                          |
|-------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_MESSAGES_CAPTURED       | NUMBER        | Total number of redo entries passed by LogMiner to the capture process for detailed rule evaluation since the capture process last started. A capture process converts a redo entry into a message and performs detailed rule evaluation on the message when capture process prefiltering cannot discard the change. |
| CAPTURE_TIME                  | DATE          | Time when the most recent message was captured                                                                                                                                                                                                                                                                       |

| TOTAL_MESSAGES_ENQUEUED       | NUMBER        | Total number of messages enqueued since the capture process was last started                                                                                                                                                                                                                                         |
| ENQUEUE_TIME                  | DATE          | Time when the last message was enqueued                                                                                                                                                                                                                                                                              |
| ENQUEUE_MESSAGE_NUMBER        | NUMBER        | Number of the last enqueued message                                                                                                                                                                                                                                                                                  |
| ENQUEUE_MESSAGE_CREATE_TIME   | DATE          | Creation time of the last enqueued message                                                                                                                                                                                                                                                                           |
| AVAILABLE_MESSAGE_NUMBER      | NUMBER        | For local capture, the last redo SCN flushed to the log files. For downstream capture, the last SCN added to LogMiner through the archived redo log files.                                                                                                                                                           |
| AVAILABLE_MESSAGE_CREATE_TIME | DATE          | For local capture, the time the SCN was written to the log file. For downstream capture, the time the most recent archived redo log file (containing the most recent SCN) was added to LogMiner.                                                                                                                     |
| ELAPSED_CAPTURE_TIME          | NUMBER        | Elapsed time (in hundredths of a second) scanning for changes in the redo log since the capture process was last started                                                                                                                                                                                             |
| ELAPSED_RULE_TIME             | NUMBER        | Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started                                                                                                                                                                                                                 |
| ELAPSED_ENQUEUE_TIME          | NUMBER        | Elapsed time (in hundredths of a second) enqueueing messages since the capture process was last started                                                                                                                                                                                                              |
| ELAPSED_LCR_TIME              | NUMBER        | Elapsed time (in hundredths of a second) creating LCRs since the capture process was last started                                                                                                                                                                                                                    |
| ELAPSED_REDO_WAIT_TIME        | NUMBER        | Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state                                                                                                                                                                                                                  |
| ELAPSED_PAUSE_TIME            | NUMBER        | Elapsed flow control pause time (in hundredths of a second)                                                                                                                                                                                                                                                          |
| STATE_CHANGED_TIME            | DATE          | Time at which the state of the capture process changed                                                                                                                                                                                                                                                               |
| SGA_USED                      | NUMBER        | The total amount of shared memory (in bytes) currently used by the capture process out of the amount allocated (SGA_ALLOCATED)                                                                                                                                                                                       |
| SGA_ALLOCATED                 | NUMBER        | The total amount of shared memory (in bytes) allocated from the Streams pool for the capture process                                                                                                                                                                                                                 |
| BYTES_OF_REDO_MINED           | VARCHAR2 (64) | The total amount of redo data mined (in bytes) since the capture process last started                                                                                                                                                                                                                                |
| SESSION_RESTART_SCN           | VARCHAR2 (64) | The SCN from which the capture process started mining redo data when it was last started                                                                                                                                                                                                                             |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

 **Note:**

The `ELAPSED_CAPTURE_TIME`, `ELAPSED_RULE_TIME`, `ELAPSED_ENQUEUE_TIME`, `ELAPSED_LCR_TIME`, and `ELAPSED_REDO_WAIT_TIME` columns are only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

 **See Also:**

- "`TIMED_STATISTICS`"
- "`STATISTICS_LEVEL`"

## 10.162 V\$XSTREAM\_MESSAGE\_TRACKING

`V$XSTREAM_MESSAGE_TRACKING` displays information about LCRs tracked through the stream that are processed by XStream components.

You can track an LCR through a stream using one of the following methods:

- Set the `message_tracking_frequency` capture process parameter to 1 or another relatively low value for XStream Outbound processes.
- Set the `message_tracking_frequency` apply process parameter to 1 or another relatively low value for XStream Inbound processes.
- Use the `DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING` procedure to specify a tracking label that becomes part of each LCR generated by the current session.

When the `actions` parameter in the `DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING` procedure is set to `DBMS_XSTREAM_ADM.ACTION_MEMORY`, information about the LCRs is tracked in memory, and this view is populated with information about the LCRs. Currently, `DBMS_XSTREAM_ADM.ACTION_MEMORY` is the only valid setting for the `actions` parameter in the procedure.

 **Note:**

This view does not display information about messages flowing in an Oracle GoldenGate configuration. To view information about such message streams, query the V\$GOLDENGATE\_MESSAGE\_TRACKING view.

| Column                | Datatype                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRACKING_LABEL        | VARCHAR2 (128)               | User-specified tracking label                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TAG                   | RAW (30)                     | First 30 bytes of the tag of the LCR                                                                                                                                                                                                                                                                                                                                                                                                              |
| COMPONENT_NAME        | VARCHAR2 (128)               | Name of the component that processed the LCR                                                                                                                                                                                                                                                                                                                                                                                                      |
| COMPONENT_TYPE        | VARCHAR2 (128)               | Type of the component that processed the LCR                                                                                                                                                                                                                                                                                                                                                                                                      |
| ACTION                | VARCHAR2 (50)                | Action performed on the LCR                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ACTION_DETAILS        | VARCHAR2 (100)               | Details of the action                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TIMESTAMP             | TIMESTAMP (9) WITH TIME ZONE | Time when the action was performed                                                                                                                                                                                                                                                                                                                                                                                                                |
| MESSAGE_CREATION_TIME | DATE                         | Time when the message was created                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MESSAGE_NUMBER        | NUMBER                       | SCN of the message                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 10.163 V\$XSTREAM\_OUTBOUND\_SERVER

V\$XSTREAM\_OUTBOUND\_SERVER displays statistics about an outbound server. An outbound server sends LCRs to the XStream client application.

**Note:**

When the COMMITTED\_DATA\_ONLY column is YES in the V\$XSTREAM\_OUTBOUND\_SERVER view, the V\$STREAMS\_APPLY\_SERVER view provides additional information about the outbound server process, and information about the apply server background processes used by the outbound server.

| Column       | Datatype       | Description                                                                                             |
|--------------|----------------|---------------------------------------------------------------------------------------------------------|
| SID          | NUMBER         | Session ID of the outbound server's session                                                             |
| SERIAL#      | NUMBER         | Serial number of the outbound server's session                                                          |
| SPID         | VARCHAR2 (12)  | Process identification number of the operating-system process that sends LCRs to the client application |
| SERVER_NAME  | VARCHAR2 (128) | Name of the outbound server                                                                             |
| STARTUP_TIME | DATE           | Time when the client application attached to the outbound server                                        |

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| SEND_TIME                     | DATE     | Time the last LCR was sent by the outbound server to the XStream client application                                                                                                                                                                                                                                                                                         |
| LAST_SENT_MESSAGE_NUMBER      | NUMBER   | Message number of the last LCR sent by the outbound server to the XStream client application                                                                                                                                                                                                                                                                                |
| LAST_SENT_MESSAGE_CREATE_TIME | DATE     | Creation time at the source database of the last LCR sent by the outbound server to the client application                                                                                                                                                                                                                                                                  |
| ELAPSED_SEND_TIME             | NUMBER   | Time elapsed (in hundredths of a second) sending LCRs to the XStream client application since the last time the client application attached to the outbound server                                                                                                                                                                                                          |
| COMMIT_POSITION               | RAW (64) | Commit position of the transaction currently being processed. This column is populated only if the <code>COMMITTED_DATA_ONLY</code> column shows YES. When the <code>COMMITTED_DATA_ONLY</code> column shows NO, this column is NULL.                                                                                                                                       |
| LAST_SENT_POSITION            | RAW (64) | Position of the last LCR sent to the XStream client application. This column is populated only if the <code>COMMITTED_DATA_ONLY</code> column shows YES. When the <code>COMMITTED_DATA_ONLY</code> column shows NO, this column is NULL.                                                                                                                                    |
| BYTES_SENT                    | NUMBER   | Total number of bytes sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server                                                                                                                                                                                                              |
| COMMITTED_DATA_ONLY           | CHAR (3) | YES if the outbound server can send only LCRs in committed transactions to the XStream client application. A committed transaction is an assembled, noninterleaving transaction with no rollbacks.<br><br>NO if the outbound server can send LCRs in transactions that have not yet committed to the XStream client application. This mode is for internal Oracle use only. |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.164 V\$XSTREAM\_TABLE\_STATS

V\$XSTREAM\_TABLE\_STATS shows the statistics for all the tables processed by each apply server for the XStream session.

| Column                  | Datatype       | Description                                                                                                                                                                      |
|-------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPLY_NAME              | VARCHAR2 (128) | Name of XStream Out or XStream In process                                                                                                                                        |
| SERVER_ID               | NUMBER         | Parallel apply server worker ID. If the server ID is 0, then this is an aggregate of statistics for servers that may have been automatically shutdown due to session inactivity. |
| SOURCE_TABLE_OWNER      | VARCHAR2 (128) | Source owner of the captured or replicated table                                                                                                                                 |
| SOURCE_TABLE_NAME       | VARCHAR2 (128) | Source name of the captured or replicated table                                                                                                                                  |
| DESTINATION_TABLE_OWNER | VARCHAR2 (128) | Target owner of the captured or replicated table                                                                                                                                 |
| DESTINATION_TABLE_NAME  | VARCHAR2 (128) | Target name of the captured or replicated table                                                                                                                                  |
| LAST_UPDATE             | DATE           | Time of last update                                                                                                                                                              |
| TOTAL_INSERTS           | NUMBER         | Number of insert operations on this table processed by this apply server for the current session                                                                                 |
| TOTAL_UPDATES           | NUMBER         | Number of update operations on this table processed by this apply server for the current session                                                                                 |
| TOTAL_DELETES           | NUMBER         | Number of delete operations on this table processed by this apply server for the current session                                                                                 |
| INSERT_COLLISIONS       | NUMBER         | Number of insert collisions on this table encountered by this apply server for the current session                                                                               |
| UPDATE_COLLISIONS       | NUMBER         | Number of update collisions on this table encountered by this apply server for the current session                                                                               |
| DELETE_COLLISIONS       | NUMBER         | Number of delete collisions on this table encountered by this apply server for the current session                                                                               |
| REPERROR_RECORDS        | NUMBER         | Number of change records that were recorded on this table by this apply server for the current session                                                                           |
| REPERROR_IGNORES        | NUMBER         | Number of ignored change records on this table by this apply server for the current session                                                                                      |
| WAIT_DEPENDENCIES       | NUMBER         | Number of waits for this table due to dependency for the current session                                                                                                         |

| Column                     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CDR_INSERT_ROW_EXISTS      | NUMBER   | Number of conflicts where an insert gets an ORA-00001 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_UPDATE_ROW_EXISTS      | NUMBER   | Number of conflicts where an update gets an ORA-26786 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_UPDATE_ROW_MISSING     | NUMBER   | Number of conflicts where an update gets an ORA-26787 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_DELETE_ROW_EXISTS      | NUMBER   | Number of conflicts where a delete gets an ORA-26786 error                                                                                                                                                                                                                                                                                                                                                                                      |
| CDR_DELETE_ROW_MISSING     | NUMBER   | Number of conflicts where a delete gets an ORA-26787 error                                                                                                                                                                                                                                                                                                                                                                                      |
| CDR_SUCCESSFUL_RESOLUTIONS | NUMBER   | Number of successfully resolved conflicts                                                                                                                                                                                                                                                                                                                                                                                                       |
| CDR_FAILED_RESOLUTIONS     | NUMBER   | Number of conflicts that could not be resolved due to an error during resolution                                                                                                                                                                                                                                                                                                                                                                |
| LOB_OPERATIONS             | NUMBER   | The number of LOB updates (LOB writes, LOB trims, and LOB erases) applied by the inbound server.                                                                                                                                                                                                                                                                                                                                                |

## 10.165 V\$XSTREAM\_TRANSACTION

V\$XSTREAM\_TRANSACTION displays information about transactions that are being processed by capture processes, outbound servers, and inbound servers. This view can identify long running transactions and to display how many LCRs are being processed in each transaction. This view only contains information about captured LCRs. It does not contain information about user-enqueued LCRs or user messages.

This view only shows information about LCRs that are being processed because they satisfied the rule sets for the component at the time of the query. For capture processes, this view only shows information about changes in transactions that the capture process has converted into LCRs. It does not show information about all the active transactions present in the redo log.

For outbound servers, this view only shows information about LCRs that the outbound server has dequeued. It does not show information about LCRs in the outbound server's queue. For outbound servers, information about a transaction remains in the view until the transaction is sent to the XStream client application.

For inbound servers, information about a transaction remains in the view until the transaction commits or until the entire transaction is rolled back.

| Column         | Datatype       | Description           |
|----------------|----------------|-----------------------|
| COMPONENT_NAME | VARCHAR2 (128) | Name of the component |

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT_TYPE           | VARCHAR2 (20)  | Type of component <ul style="list-style-type: none"> <li>CAPTURE - Capture process</li> <li>APPLY - Apply reader subcomponent in an outbound server or inbound server</li> <li>PROPAGATION_SENDER - Propagation sender that sends LCRs from a capture process to an outbound server</li> </ul>                                                                                                                                                  |
| XIDUSN                   | NUMBER         | Transaction ID undo segment number of the transaction                                                                                                                                                                                                                                                                                                                                                                                           |
| XIDSLT                   | NUMBER         | Transaction ID slot number of the transaction                                                                                                                                                                                                                                                                                                                                                                                                   |
| XIDSQN                   | NUMBER         | Transaction ID sequence number of the transaction                                                                                                                                                                                                                                                                                                                                                                                               |
| CUMULATIVE_MESSAGE_COUNT | NUMBER         | Number of LCRs processed in the transaction. If a component is restarted while the transaction is being processed, then this column shows the number of LCRs processed in the transaction since the component was started.                                                                                                                                                                                                                      |
| TOTAL_MESSAGE_COUNT      | NUMBER         | Total number of LCRs processed in the transaction by an outbound server or inbound server. This column does not pertain to capture processes.                                                                                                                                                                                                                                                                                                   |
| FIRST_MESSAGE_TIME       | DATE           | Time stamp of the first LCR processed in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the time stamp of the first LCR processed after the capture process was started.                                                                                                                                                                                                   |
| FIRST_MESSAGE_NUMBER     | NUMBER         | SCN of the first message in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the SCN of the first message processed after the capture process was started.                                                                                                                                                                                                                   |
| LAST_MESSAGE_TIME        | DATE           | Time stamp of the last LCR processed in the transaction                                                                                                                                                                                                                                                                                                                                                                                         |
| LAST_MESSAGE_NUMBER      | NUMBER         | SCN of the most recent message encountered for the transaction                                                                                                                                                                                                                                                                                                                                                                                  |
| FIRST_MESSAGE_POSITION   | RAW (64)       | Position of the first message seen by an XStream inbound server<br>This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                         |
| LAST_MESSAGE_POSITION    | RAW (64)       | Position of the last message seen by an XStream inbound server. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                            |
| TRANSACTION_ID           | VARCHAR2 (128) | Transaction ID for an XStream inbound server. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                              |
| CON_ID                   | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.166 V\$ZONEMAP\_USAGE\_STATS

V\$ZONEMAP\_USAGE\_STATS displays zone map usage statistics.

| Column       | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ZONEMAP      | VARCHAR2 (257) | Name of the zone map in the form of <i>owner.name</i>                                                                                                                                                                                                                                                                                                                                                                                             |
| PRUNING_TYPE | VARCHAR2 (11)  | Type of data pruning performed using the zone map                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXECUTIONS   | NUMBER         | Number of executions, including parallel worker executions                                                                                                                                                                                                                                                                                                                                                                                        |
| BASE_COUNT   | NUMBER         | Base count accumulated over number of executions                                                                                                                                                                                                                                                                                                                                                                                                  |
| PRUNED_COUNT | NUMBER         | Pruned count accumulated over number of executions                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID       | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

The ratio (`PRUNED_COUNT` / `BASE_COUNT`) shows the fraction of data pruned by the zone map.

# Part IV

## Appendixes

This part includes the following appendixes:

- [Database Limits](#)
- [SQL Scripts](#)
- [Oracle Wait Events](#)
- [Oracle Enqueue Names](#)
- [Statistics Descriptions](#)
- [Background Processes](#)

# A

## Database Limits

This appendix lists the limits of values associated with database functions and objects. Limits exist on several levels in the database. There is usually a hard-coded limit in the database that cannot be exceeded. This value may be further restricted for any given operating system. Database limits are divided into four categories:

- [Datatype Limits](#)
- [Physical Database Limits](#)
- [Logical Database Limits](#)
- [Process and Runtime Limits](#)

## A.1 Datatype Limits

This table documents the limits for datatypes, and includes comments about the datatypes.

| Datatypes | Limit                                                                                                                                                                                                                                                                   | Comments                                                                                                                                                                                                                                                                                                                        |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BFILE     | <p>Maximum size: 2<sup>64</sup> bytes (18.44 exabytes) or OS file size limit, whichever is the lower value</p> <p>Maximum size of a file name: 255 characters</p> <p>Maximum size of a directory name: 128 bytes</p> <p>Maximum number of open BFILEs: see Comments</p> | The maximum number of BFILEs is limited by the value of the <code>SESSION_MAX_OPEN_FILES</code> initialization parameter, which is itself limited by the maximum number of open files the operating system will allow.                                                                                                          |
| BLOB      | Maximum size: (4 GB - 1) * <code>DB_BLOCK_SIZE</code> initialization parameter (8 TB to 128 TB)                                                                                                                                                                         | <p>The number of LOB columns per table is limited only by the maximum number of columns per table (that is, 1000 if <code>MAX_COLUMNS = STANDARD</code> and 4096 if <code>MAX_COLUMNS = EXTENDED</code><sup>1</sup>).</p> <p><b>See Also:</b> "<a href="#">MAX_COLUMNS</a>" initialization parameter for additional details</p> |

| RAW                                               | Maximum size: 2000 bytes, or 32767 bytes if the MAX_STRING_SIZE initialization parameter is set to EXTENDED<br><br><b>See Also:</b> "MAX_STRING_SIZE" initialization parameter for additional details | None                                                                                                                                                                                                                                                                             |
| VARCHAR2                                          | Maximum size: 4000 bytes, or 32767 bytes if the MAX_STRING_SIZE initialization parameter is set to EXTENDED<br><br><b>See Also:</b> "MAX_STRING_SIZE" initialization parameter for additional details | None                                                                                                                                                                                                                                                                             |

<sup>1</sup> The absolute maximum number of columns in a table is 1000 or 4096, depending on the value of the MAX\_COLUMNS initialization parameter. However, when you create an object table (or a relational table with columns of object, nested table, varray, or REF type), Oracle maps the columns of the user-defined types to relational columns, creating in effect hidden columns that count toward the maximum column limit. For details on how Oracle calculates the total number of columns in such a table, refer to *Oracle Database Administrator's Guide*.

<sup>2</sup> All forms of LONG data types (LONG, LONG RAW, LONG VARCHAR, LONG VARRAW) were deprecated in Oracle8i Release 8.1.6. For succeeding releases, the LONG data type was provided for backward compatibility with existing applications. In new applications developed with later releases, Oracle strongly recommends that you use the CLOB or NCLOB data type for storing large amounts of character data.

## A.2 Physical Database Limits

This table describes limit types and limit values for physical database items.

| Item                 | Type of Limit                                    | Limit Value                                                                                                                                                                                                                                                |
|----------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Controlfiles         | Number of control files                          | 1 minimum; 2 or more (on separate devices) strongly recommended                                                                                                                                                                                            |
| Controlfiles         | Size of a control file                           | Maximum of 201031680 logical blocks                                                                                                                                                                                                                        |
| Database Block Size  | Minimum                                          | 2048 bytes; must be a multiple of operating system physical block size                                                                                                                                                                                     |
| Database Block Size  | Maximum                                          | Operating system dependent; never more than 32 KB                                                                                                                                                                                                          |
| Database Blocks      | Minimum in initial extent of a segment           | 2 blocks                                                                                                                                                                                                                                                   |
| Database Blocks      | Maximum per datafile                             | Platform dependent; typically $2^{22} - 1$ blocks                                                                                                                                                                                                          |
| Database extents     | Maximum per dictionary managed tablespace        | 4 GB * physical block size (with K/M modifier); 4 GB (without K/M modifier)                                                                                                                                                                                |
| Database extents     | Maximum per locally managed (uniform) tablespace | 256 KB * physical block size                                                                                                                                                                                                                               |
| Database file size   | Maximum                                          | Operating system dependent. Limited by maximum operating system file size. See the <b>Bigfile Tablespaces</b> and <b>Smallfile (traditional) Tablespaces</b> rows for more information about the maximum database file size in these types of tablespaces. |
| Database files       | Maximum per tablespace                           | Operating system dependent; usually 1023                                                                                                                                                                                                                   |
| Database files       | Maximum per database                             | 65533<br>May be less on some operating systems<br>Limited also by size of database blocks and by the DB_FILES initialization parameter for a particular instance                                                                                           |
| External Tables file | Maximum size                                     | Dependent on the operating system<br>An external table can be composed of multiple files.                                                                                                                                                                  |
| MAXEXTENTS           | Default value                                    | Derived from tablespace default storage or DB_BLOCK_SIZE initialization parameter                                                                                                                                                                          |
| MAXEXTENTS           | Maximum                                          | Not defined                                                                                                                                                                                                                                                |
| Redo Log File Size   | Minimum size                                     | 4 MB                                                                                                                                                                                                                                                       |
| Redo Log File Size   | Maximum Size                                     | Operating system limit; typically 2 TB                                                                                                                                                                                                                     |

| Item                                | Type of Limit                        | Limit Value                                                                                                                                                                                                                                                                               |
|-------------------------------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Redo Log Files                      | Maximum number of logfiles           | Limited by value of <code>MAXLOGFILES</code> parameter in the <code>CREATE DATABASE</code> statement<br>Control file can be resized to allow more entries; ultimately an operating system limit                                                                                           |
| Redo Log Files                      | Maximum number of logfiles per group | Not defined                                                                                                                                                                                                                                                                               |
| Tablespaces                         | Maximum number per database          | 64 K<br>Number of tablespaces cannot exceed the number of database files because each tablespace must include at least one file                                                                                                                                                           |
| Bigfile Tablespaces                 | Number of blocks                     | A bigfile tablespace contains only one datafile or tempfile, which can contain up to approximately 4 billion ( $2^{32}$ ) blocks. The maximum size of the single datafile or tempfile is 128 terabytes (TB) for a tablespace with 32 K blocks and 32 TB for a tablespace with 8 K blocks. |
| Smallfile (traditional) Tablespaces | Number of blocks                     | A smallfile tablespace is a traditional Oracle tablespace, which can contain 1023 datafiles or tempfiles, each of which can contain up to approximately 4 million ( $2^{22}$ ) blocks.                                                                                                    |

## A.3 Logical Database Limits

This table describes limit types and limit values for logical database items.

| Item        | Type of Limit                          | Limit Value                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Columns     | Maximum per table                      | If <code>MAX_COLUMNS</code> = STANDARD: 1000<br>If <code>MAX_COLUMNS</code> = EXTENDED: 4096 (available starting with Oracle Database 23ai)<br><b>See Also:</b> " <code>MAX_COLUMNS</code> " initialization parameter for additional details                                       |
| Columns     | Maximum per index (or clustered index) | 32                                                                                                                                                                                                                                                                                 |
| Columns     | Maximum per bitmapped index            | 30                                                                                                                                                                                                                                                                                 |
| Constraints | Maximum per column                     | Not defined<br>Oracle does not define a limit on the number of constraints per column. However, constraints are subject to the limit on the maximum number of constraints in the database. See the entry for " <a href="#">Constraints - Maximum per database</a> " in this table. |

| Item                                | Type of Limit                   | Limit Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Constraints                         | Maximum per database            | <p>4,294,967,293</p> <p>Constraints are numbered internally from 1 to 4,294,967,294. The internal number is incremented each time a constraint is created. One number is always consumed by a special internal user called <code>_NEXT_CONSTRAINT</code>, which represents the next available number for a new constraint. Starting with Oracle Database 23ai, the database reuses constraint numbers. Therefore, the maximum number of constraints that can exist in the database at any given time is 4,294,967,293.</p> <p>You can view constraint numbers by querying the <code>CON#</code> column of the <code>SYS.CON\$</code> table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Dictionary-managed database objects | Maximum per database            | <p>4,254,950,911 - overhead</p> <ul style="list-style-type: none"> <li>The value of 4,254,950,911 is derived as follows: The data type used for object identifiers can store a maximum value of 4,294,967,294. However, approximately 40 million of these values are reserved at the high end for other purposes, which results in a maximum object identifier value of 4,254,950,911.</li> <li>Overhead includes the following: <ul style="list-style-type: none"> <li>Multiple object identifiers for one database object <p>Database objects consume one object identifier at the time of creation. This identifier is displayed in both the <code>OBJECT_ID</code> and <code>DATA_OBJECT_ID</code> columns of the <a href="#">ALL_OBJECTS</a> view. Over the lifetime of an object, the value of <code>OBJECT_ID</code> remains unchanged, but the value of <code>DATA_OBJECT_ID</code> changes when the object is altered, for example, with a DDL statement or a table truncation. Therefore, one object can consume more than one object identifier over its lifetime.</p> </li> <li>Object identifiers for lightweight jobs <p>Lightweight jobs consume object identifiers, even though they are not permanent objects. Therefore, if many lightweight jobs are running in the database, the number of objects that can be created in the database is dependent upon the remaining pool of identifiers.</p> </li> </ul> </li> </ul> |
| Indexes                             | Maximum per table               | <p>Not defined</p> <p>Oracle does not define a limit on the number of indexes per table. However, indexes are subject to the limit on the maximum number of dictionary-managed database objects allowed per database. See the entry for "<a href="#">Dictionary-managed database objects</a>" in this table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Indexes                             | Total size of indexed column(s) | <p>Approximately 75% of the database block size minus some overhead</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Item                         | Type of Limit                                                    | Limit Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Tables                       | Maximum per clustered table                                      | 32 tables                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Tables                       | Maximum per database                                             | Not defined<br>Oracle does not define a limit on the number of tables per database. However, tables are subject to the limit on the maximum number of dictionary-managed database objects allowed per database. See the entry for " <a href="#">Dictionary-managed database objects</a> " in this table.                                                                                                                                                                                                                                                                                              |
| Users and Roles              | Maximum                                                          | 2,147,483,638<br>Users and roles are numbered internally from 0 to 2,147,483,638. The internal number is incremented each time a user or role is created, and numbers are never recycled. One number is always consumed by a special internal user called <code>_NEXT_USER</code> , which represents the next available number for a new user or role. Therefore, the maximum number of users and roles that can be created during the lifetime of a database is 2,147,483,638.<br>You can view user and role numbers by querying the <code>USER#</code> column of the <code>SYS.USER\$</code> table. |

**Note:**

The limit on how long a SQL statement can be depends on many factors, including database configuration, disk space, and memory

**Note:**

When an object instance exists in memory, there is no fixed limit on the number of attributes in the object. But the maximum total amount of memory consumed by an object instance is 4 GB. When an object instance is inserted into a table, the attributes are exploded into separate columns in the table, and these columns count toward the limit on the maximum number of columns per table.

## A.4 Process and Runtime Limits

This table describes limit types and limit values for process and runtime items.

| Item                           | Type of Limit                                             | Limit Value                                                                                                           |
|--------------------------------|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Advanced Queuing Processes     | Maximum per instance                                      | 10                                                                                                                    |
| Backup Sessions                | Maximum per instance                                      | Limited by the PROCESSES and SESSIONS initialization parameters, for instance                                         |
| Dispatchers                    | Maximum per instance                                      | Limited by the PROCESSES and SESSIONS initialization parameters, for instance                                         |
| Global Cache Service Processes | Maximum per instance                                      | 10                                                                                                                    |
| Instances per database         | Maximum number of cluster database instances per database | Operating system-dependent                                                                                            |
| I/O Worker Processes           | Maximum per background process (DBWR, LGWR, and so on)    | 15                                                                                                                    |
| I/O Worker Processes           | Maximum per Backup session                                | 15                                                                                                                    |
| Job Queue Processes            | Maximum per instance                                      | 1000                                                                                                                  |
| Locks                          | Row-level                                                 | Not defined                                                                                                           |
| Parallel Execution Workers     | Maximum per instance                                      | Limited by the PROCESSES and SESSIONS initialization parameters, for instance                                         |
| Services                       | Maximum per instance                                      | 8200                                                                                                                  |
| Sessions                       | Maximum per instance                                      | $2^{16}$ ; limited by the PROCESSES and SESSIONS initialization parameters. $2^{16}$ is 65536.                        |
| SGA size                       | Maximum value                                             | Operating system-dependent; typically 2 to 4 GB for 32-bit operating systems, and > 4 GB for 64-bit operating systems |
| Shared Servers                 | Maximum per instance                                      | Limited by the PROCESSES and SESSIONS initialization parameters, for instance                                         |

# B

## SQL Scripts

This appendix describes SQL scripts that are required for optimal operation of the Oracle Database.

The SQL scripts are described in the following sections:

- [Creating the Data Dictionary](#)
- [Creating Additional Data Dictionary Structures](#)
- [The "NO" Scripts](#)
- [Upgrade Scripts](#)
- [Java Scripts](#)

### Note:

Comments within the SQL scripts themselves contain more detailed information and examples.

### Note:

To run scripts in a pluggable database (PDB), connect to the PDB before running the script. For more information about running scripts in a multitenant container database (CDB), see *Oracle Multitenant Administrator's Guide*.

## B.1 Creating the Data Dictionary

When you use the Database Configuration Assistant to create a database, Oracle automatically creates the data dictionary. Thereafter, whenever the database is in operation, Oracle updates the data dictionary in response to every DDL statement. The data dictionary base tables are the first objects created in any Oracle database. They are created in the `SYSTEM` tablespace and must remain there. The data dictionary base tables store information about all user-defined objects in the database.

[Table B-1](#) lists required scripts, which are run automatically when you create a database using the Database Configuration Assistant. They are described here because you might need to run them if you create a database manually. To run these scripts, you must be connected to Oracle as a user with `SYSDBA` privileges.

**Table B-1 Creating the Data Dictionary Scripts**

| Script Name  | Needed For                       | Description                                                                                                                                                                                                                                              |
|--------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| catalog.sql  | All databases                    | Creates the data dictionary and public synonyms for many of its views<br>Grants PUBLIC access to the synonyms                                                                                                                                            |
| catproc.sql  | All databases                    | Runs all scripts required for, or used with, PL/SQL                                                                                                                                                                                                      |
| catpcat.sql  | All databases                    | Runs the catalog.sql and catproc.sql scripts as parallel processes, which can speed up database creation<br><b>Note:</b> You must run catpcat.sql by using the catctl.pl program. See <i>Oracle Database Administrator's Guide</i> for more information. |
| catclust.sql | Oracle Real Application Clusters | Creates Oracle Real Application Clusters data dictionary views                                                                                                                                                                                           |

 **See Also:**

## B.2 Creating Additional Data Dictionary Structures

Oracle Database supplies other scripts that create additional structures you can use in managing your database and creating database applications. These scripts are listed in [Table B-2](#).

 **See Also:**

Your operating system-specific Oracle documentation for the exact names and locations of these scripts on your operating system

**Table B-2 Creating Additional Data Dictionary Structures**

| Script Name  | Needed For             | Run By | Description                                                                                                                        |
|--------------|------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------|
| catblock.sql | Performance management | SYS    | Creates views that can dynamically display lock dependency graphs<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i> |

**Table B-2 (Cont.) Creating Additional Data Dictionary Structures**

| Script Name                      | Needed For             | Run By        | Description                                                                                                                                                                                                                                                          |
|----------------------------------|------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cathss.sql                       | Heterogeneous Services | SYS           | Installs packages for administering heterogeneous services<br><b>See Also:</b> <i>Oracle Database Gateway for APPC Installation and Configuration Guide for Microsoft Windows</i>                                                                                    |
| catio.sql                        | Performance management | SYS           | Allows I/O to be traced on a table-by-table basis                                                                                                                                                                                                                    |
| catqueue.sql                     | Advanced Queuing       |               | Creates the dictionary objects required for Advanced Queuing                                                                                                                                                                                                         |
| catrep.sql                       | Oracle Replication     | SYS           | Runs all SQL scripts for enabling database replication                                                                                                                                                                                                               |
| catwrr.sql                       | Database Replay        | SYS           | Main script that creates the entire schema related to Database Replay - calls the create schema scripts for Workload Capture, Database Replay, Workload Replay, and Workload Intelligence                                                                            |
| catwrrwithb.sql                  | Database Replay        | SYS           | Creates the schema for Workload Intelligence                                                                                                                                                                                                                         |
| dbmsiotc.sql                     | Storage management     | Any user      | Analyzes chained rows in index-organized tables                                                                                                                                                                                                                      |
| dbmspool.sql                     | Performance management | SYS or SYSDBA | Enables DBA to lock PL/SQL packages, SQL statements, and triggers into the shared pool<br><b>See Also:</b> <i>Oracle Database PL/SQL Packages and Types Reference</i>                                                                                                |
| userlock.sql                     | Concurrency control    | SYS or SYSDBA | Provides a facility for user-named locks that can be used in a local or clustered environment to aid in sequencing application actions                                                                                                                               |
| utlbstat.sql and<br>utlestat.sql | Performance monitoring | SYS           | Respectively start and stop collecting performance tuning statistics                                                                                                                                                                                                 |
| utlchn1.sql                      | Storage management     | Any user      | For use with the Oracle Database. Creates tables for storing the output of the <code>ANALYZE</code> command with the <code>CHAINED ROWS</code> option. Can handle both physical and logical rowids.<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i> |
| utlconst.sql                     | Year 2000 compliance   | Any user      | Provides functions to validate that <code>CHECK</code> constraints on date columns are year 2000 compliant                                                                                                                                                           |
| utldtree.sql                     | Metadata management    | Any user      | Creates tables and views that show dependencies between objects<br><b>See Also:</b> <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i>                                                                                                           |
| utlexpt1.sql                     | Constraints            | Any user      | For use with the Oracle Database. Creates the default table ( <code>EXCEPTIONS</code> ) for storing exceptions from enabling constraints. Can handle both physical and logical rowids.<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i>              |

**Table B-2 (Cont.) Creating Additional Data Dictionary Structures**

| Script Name    | Needed For                             | Run By                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|----------------------------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| utlfixdirs.sql | Moving a database to a new Oracle home | SYS                           | <p>Used after moving a database to a new Oracle home. Updates directory objects to use the new path names for the Oracle home and Oracle base directories, as defined by the new values for the <code>ORACLE_HOME</code> and <code>ORACLE_BASE</code> environment variables.</p> <p>When you run this script in the root container of a CDB, it updates directory objects in the root, as well as any Oracle-maintained directory objects in the PDBs; you must manually update any PDB directory objects that are not Oracle-maintained.</p> |
| utlip.sql      | PL/SQL                                 | SYS                           | <p>Used primarily for upgrade and downgrade operations. It invalidates all existing PL/SQL modules by altering certain dictionary tables so that subsequent recompilations will occur in the format required by the database. It also reloads the packages <code>STANDARD</code> and <code>DBMS_STANDARD</code>, which are necessary for any PL/SQL compilations.</p>                                                                                                                                                                         |
| utlirp.sql     | PL/SQL                                 | SYS                           | <p>Used to change from 32-bit to 64-bit word size or vice versa. This script recompiles existing PL/SQL modules in the format required by the new database. It first alters some data dictionary tables. Then it reloads the packages <code>STANDARD</code> and <code>DBMS_STANDARD</code>, which are necessary for using PL/SQL. Finally, it triggers a recompilation of all PL/SQL modules, such as packages, procedures, and types.</p>                                                                                                    |
| utllockt.sql   | Performance monitoring                 | SYS or SYSDBA                 | <p>Displays a lock wait-for graph, in tree structure format</p> <p><b>See Also:</b> <i>Oracle Database Administrator's Guide</i></p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| utlpwdmg.sql   | Security                               | SYS or SYSDBA                 | <p>Creates PL/SQL functions for default password complexity verification. Sets the default password profile parameters and enables password management features.</p> <p><b>See Also:</b> <i>Oracle Database Security Guide</i></p>                                                                                                                                                                                                                                                                                                            |

| catnogwm.sql     | Global Data Services      | SYS    | Drops users, roles, and other objects created for Global Data Services.                                                                                                               |
| catnohs.sql      | Heterogeneous Services    | SYS    | Removes Heterogeneous Services dictionary metadata                                                                                                                                    |
| catnojav.sql     | Java                      | SYS    | Drops the RDBMS Java classes and system triggers created by the <code>catjava.sql</code> script.                                                                                      |
| catnoprt.sql     | Partitioning              | SYS    | Drops views and synonyms on dictionary metadata that relate to partitioned tables and indexes                                                                                         |
| catnosvm.sql     | Server Manager            | SYS    | Removes Oracle7 Server Manager views and synonyms                                                                                                                                     |
| catnowrr.sql     | Database Replay           | SYS    | Main script that drops the entire schema related to Database Replay - calls the drop schema scripts for Workload Capture, Database Replay, Workload Replay, and Workload Intelligence |
| catnowrrc.sql    | Database Replay           | SYS    | Drops the schema related to Workload Capture                                                                                                                                          |
| catnowrrp.sql    | Database Replay           | SYS    | Drops the schema related to Workload Replay                                                                                                                                           |
| catnowrrwitb.sql | Database Replay           | SYS    | Drops the schema related to Workload Intelligence                                                                                                                                     |
| catnsnmp.sql     | Distributed management    | SYS    | Drops the DBSNMP user and SNMPAGENT role                                                                                                                                              |

## B.4 Upgrade Scripts

Upgrade scripts are used when upgrading to another release of Oracle.

### See Also:

*Oracle Database Upgrade Guide* for information about upgrade scripts

## B.5 Java Scripts

The Java scripts are useful only if the JServer option is installed.

**Table B-4 Java Scripts**

| Script Name              | Description                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------|
| <code>initjvm.sql</code> | Initializes JServer by installing core Java class libraries and Oracle-specific Java classes          |
| <code>rmjvm.sql</code>   | Removes all elements of the JServer<br><b>See Also:</b> <i>Oracle Database Java Developer's Guide</i> |
| <code>catjava.sql</code> | Installs Java-related packages and classes                                                            |

# C

## Oracle Wait Events

This appendix describes Oracle wait events.

It includes these topics:

- [Classes of Wait Events](#)
- [Descriptions of Common Wait Event Parameters](#)
- [Descriptions of Wait Events](#)

Information about wait events is displayed in three dynamic performance views:

- `V$SESSION_WAIT` displays the events for which sessions have just completed waiting or are currently waiting.
- `V$SYSTEM_EVENT` displays the total number of times all the sessions have waited for the events in that view.
- `V$SESSION_EVENT` is similar to `V$SYSTEM_EVENT`, but displays all waits for each session.

### See Also:

["V\\$SESSION\\_WAIT"](#), ["V\\$SYSTEM\\_EVENT"](#), and ["V\\$SESSION\\_EVENT"](#)

Many of these wait events are tied to the internal implementation of Oracle and therefore are subject to change or deletion without notice. Application developers should be aware of this and write their code to tolerate missing or extra wait events.

The following SQL statement displays an alphabetical list of all Oracle wait events and the wait class to which they belong:

```
SQL> SELECT name, wait_class FROM V$EVENT_NAME ORDER BY name;
```

## C.1 Classes of Wait Events

Every wait event belongs to a class of wait event.

The following list describes each of the wait classes.

### Administrative

Waits resulting from DBA commands that cause users to wait (for example, an index rebuild)

### Application

Waits resulting from user application code (for example, lock waits caused by row level locking or explicit lock commands)

### **Cluster**

Waits related to Oracle Real Application Clusters resources (for example, global cache resources such as 'gc cr block busy')

### **Commit**

This wait class only comprises one wait event - wait for redo log write confirmation after a commit (that is, 'log file sync')

### **Concurrency**

Waits for internal database resources (for example, latches)

### **Configuration**

Waits caused by inadequate configuration of database or instance resources (for example, undersized log file sizes, shared pool size)

### **Idle**

Waits that signify the session is inactive, waiting for work (for example, 'SQL\*Net message from client')

### **Network**

Waits related to network messaging (for example, 'SQL\*Net more data to dblink')

### **Other**

Waits which should not typically occur on a system (for example, 'wait for EMON to spawn')

### **Queueing**

Contains events that signify delays in obtaining additional data in a pipelined environment. The time spent on these wait events indicates inefficiency or other problems in the pipeline. It affects features such as parallel queries or `DBMS_PIPE` PL/SQL packages.

### **Scheduler**

Resource Manager related waits (for example, 'resmgr: become active')

### **System I/O**

Waits for background process I/O (for example, DBWR wait for 'db file parallel write')

### **User I/O**

Waits for user I/O (for example 'db file sequential read')

## **C.2 Descriptions of Common Wait Event Parameters**

This section describes some of the common wait event parameters.

### **block#**

This is the block number of the block for which Oracle needs to wait. The block number is relative to the start of the file. To find the object to which this block belongs, issue the following SQL statement:

```
select segment_name, segment_type, owner, tablespace_name
from dba_extents
where file_id = file#
 and block#
 between block_id and block_id + blocks - 1;
```

### blocks

The number of blocks that is being either read from or written to the file. The block size depends on the file type:

- Database files have a block size of `DB_BLOCK_SIZE`
- Logfiles and control files have a block size that is equivalent to the physical block size of the platform

### break?

If the value for this parameter equals 0, a reset was sent to the client. A nonzero value indicates that a break was sent to the client.

### class

The class of the block describes how the contents of the block are used. For example, class 1 represents data block, and class 2 represents sort block. Use this SQL query to see the block classes:

```
select view_definition
from v$fixed_view_definition
where view_name='GV$WAITSTAT';
```

### dba

The initials "dba" represents the data block address, which consists of a file number and a block number.

### driver id

The address of the disconnect function of the driver that is currently being used.

### file#

The following query returns the name of the database file:

```
select *
from v$datafile
where file# = file#;
```

### id1

The first identifier (*id1*) of the enqueue or global lock takes its value from P2 or P2RAW. The meaning of the identifier depends on the name (P1).

### id2

The second identifier (*id2*) of the enqueue or global lock takes its value from P3 or P3RAW. The meaning of the identifier depends on the name (P1).

## mode

The *mode* is usually stored in the low order bytes of P1 or P1RAW and indicates the mode of the enqueue or global lock request. This parameter has one of the following values:

**Table C-1 Lock Mode Values**

| Mode Value | Description         |
|------------|---------------------|
| 1          | Null mode           |
| 2          | Sub-Share           |
| 3          | Sub-Exclusive       |
| 4          | Share               |
| 5          | Share/Sub-Exclusive |
| 6          | Exclusive           |

Use the following SQL statement to retrieve the name of the lock and the mode of the lock request:

```
select chr(bitand(p1,-16777216)/16777215)||
 chr(bitand(p1, 16711680)/65535) "Lock",
 bitand(p1, 65535) "Mode"
from v$session_wait
where event = 'DFS enqueue lock acquisition';
```

## name and type

The name or "type" of the enqueue or global lock can be determined by looking at the two high order bytes of P1 or P1RAW. The name is always two characters. Use the following SQL statement to retrieve the lock name.

```
select chr(bitand(p1,-16777216)/16777215)||
 chr(bitand(p1,16711680)/65535) "Lock"
from v$session_wait
where event = 'DFS enqueue lock acquisition';
```

## namespace

The name of the object namespace as it is displayed in V\$DB\_OBJECT\_CACHE view.

## requests

The number of I/Os that are "requested." This differs from the number of blocks in that one request could potentially contain multiple blocks.

## session#

The number of the inactive session. Use the following SQL statement to find more information about the session:

```
select *
from v$session
where sid = session#;
```

## waited

This is the total amount of time the session has waited for this session to terminate.

## C.3 Descriptions of Wait Events

This section provides detailed descriptions for those wait events of greatest interest.

Where appropriate, pointers are provided to further information elsewhere in Oracle Database documentation. For a complete listing of wait events, in alphabetical order, you can issue the following SQL statement:

```
SQL> SELECT name FROM V$EVENT_NAME ORDER BY name;
```

### C.3.1 alter system set dispatcher

A session has issued a statement `ALTER SYSTEM SET DISPATCHER = string` and is waiting for the dispatchers to get started.

**Wait Time:** The session will wait 1 / 100 of a second and verify if the new dispatchers have started, else the session will wait again

| Parameter     | Description                                                     |
|---------------|-----------------------------------------------------------------|
| <i>waited</i> | Number of times that the session has waited 1 / 100 of a second |

### C.3.2 ARCH Remote Write

Used to track the time (in centiseconds) that `ARCn` background processes spend blocked waiting for network write operations to complete.

### C.3.3 ASYNC Remote Write

Used to track the time (in centiseconds) for asynchronous streaming `RFSWRITE` operations. This includes stall reaps and streaming network submission time. This time is accumulated by `TTnn` (Redo Transport Worker) background processes.

#### See Also:

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.4 BFILE check if exists

The session waits to check if an external large object (LOB) exists.

**Wait Time:** The total elapsed time for the `exists` call

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.5 BFILE check if open

The session waits for an external large object (LOB) to open.

**Wait Time:** The total elapsed time for the **isopen** call

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.6 BFILE closure

The session waits for an external large object (LOB) to close.

**Wait Time:** The total elapsed time for the **close** call

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.7 BFILE get length

The session waits on a call to check the size of an external large object (LOB).

**Wait Time:** The total elapsed time for the call to check the LOB size

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.8 BFILE get name object

The session waits on a call to find or generate the external name of a external large object.

**Wait Time:** The total elapsed time for **make external file name** to complete

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.9 BFILE get path object

The session is waiting on a call to find or generate the external path name of an external large object (LOB).

**Wait Time:** The total elapsed time for **make external path** to complete

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.10 BFILE internal seek

The session waits for a positioning call within the external large object (LOB) to complete.

**Wait Time:** The total elapsed time for the **seek** to complete

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.11 BFILE open

The session waits for an external large object (LOB) to open.

**Wait Time:** The total elapsed time for the **isopen** call

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.12 BFILE read

The session waits for a read from a external large object (LOB) to complete.

**Wait Time:** The total elapsed time for the **read** to complete

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.13 broadcast mesg queue transition

Processes enter "wait for broadcast mesg queue transition" when cleaning up a publisher channel handle to a RELIABLE broadcast channel. The publisher is responsible for moving the message to the free queue, but it cannot do so until the message is in the done queue. If the message is still not in the done queue, process enters this wait. This wait event will most likely appear when an Oracle process is about to exit normally, or when PMON cleans up a terminated process.

**Wait Time:** Varies

| Parameter             | Description                      |
|-----------------------|----------------------------------|
| <i>channel handle</i> | publisher channel handle pointer |

| Parameter       | Description                                                          |
|-----------------|----------------------------------------------------------------------|
| <i>message</i>  | broadcast message pointer                                            |
| <i>location</i> | A number indicating the function in KSR where the process is waiting |

### C.3.14 broadcast mesg recovery queue transition

Processes enter "wait for broadcast mesg recovery queue transition" when cleaning up a publisher channel handle to a RELIABLE broadcast channel. The broadcasted message is in the recovery queue of another channel handle (for example, ch2). Process enters this wait, if the message is yet to be removed from the recovery queue of the ch2 channel handle. This wait event will most likely appear when an Oracle process is about to exit normally, or when PMON cleans up a terminated process.

**Wait Time:** Varies

| Parameter             | Description                                                          |
|-----------------------|----------------------------------------------------------------------|
| <i>channel handle</i> | Publisher channel handle pointer                                     |
| <i>message</i>        | Broadcast message pointer                                            |
| <i>location</i>       | A number indicating the function in KSR where the process is waiting |

### C.3.15 buffer busy waits

Wait until a buffer becomes available.

There are four reasons that a session cannot pin a buffer in the buffer cache, and a separate wait event exists for each reason:

1. "buffer busy waits": A session cannot pin the buffer in the buffer cache because another session has the buffer pinned.
2. "read by other session": A session cannot pin the buffer in the buffer cache because another session is reading the buffer from disk.
3. "gc buffer busy acquire": A session cannot pin the buffer in the buffer cache because another session is reading the buffer from the cache of another instance.
4. "gc buffer busy release": A session cannot pin the buffer in the buffer cache because another session on another instance is taking the buffer from this cache into its own cache so it can pin it.

Prior to release 10.1, all four reasons were covered by "buffer busy waits." In release 10.1, the "gc buffer busy" wait event covered both the "gc buffer busy acquire" and "gc buffer busy release" wait events.

**Wait Time:** Normal wait time is 1 second. If the session was waiting for a buffer during the last wait, then the next wait will be 3 seconds.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about the potential causes of the buffer busy waits wait event

## C.3.16 buffer deadlock

Oracle does not really wait on this event; the foreground only yields the CPU. Thus, the chances of catching this event are very low. This is not an application induced deadlock, but an assumed deadlock by the cache layer. The cache layer cannot get a buffer in a certain mode within a certain amount of time.

**Wait Time:** 0 seconds. The foreground process only yields the CPU and will usually be placed at the end of the CPU run queue.

| Parameter    | Description                                                                 |
|--------------|-----------------------------------------------------------------------------|
| <i>class</i> | See " <a href="#">class</a> "                                               |
| <i>mode</i>  | See " <a href="#">mode</a> "                                                |
| <i>flag</i>  | The flag points to the internal flags used by the session to get this block |
| <i>dba</i>   | See " <a href="#">dba</a> "                                                 |

## C.3.17 buffer latch

The session waits on the buffer hash chain latch. Primarily used in the dump routines.

**Wait Time:** 1 second

| Parameter         | Description                                                                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>latch addr</i> | The virtual address in the SGA where this latch is located. Use the following statement to find the name of this latch: <pre>select * from v\$latch a, v\$latchname b where addr = latch addr and a.latch# = b.latch#;</pre> |
| <i>chain#</i>     | The index into array of buffer hash chains. When the chain is 0xffffffff, the foreground waits on the LRU latch.                                                                                                             |

## C.3.18 buffer read retry

This event occurs only if the instance is mounted in shared mode (Oracle Real Application Cluster).

During the read of the buffer, the contents changed. This means that either:

- The version number, dba, or the incarnation and sequence number stored in the block no longer match
- The checksum on the block does not match the checksum in the block

The block will be reread (this may fail up to 3 times), then corruption is assumed and the corrupt block is dumped in the trace file.

**Wait Time:** The wait time is the elapsed time of the read

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |

### C.3.19 checkpoint completed

A session waits for a checkpoint to complete. This could happen, for example, during a close database or a local checkpoint.

**Wait Time:** 5 seconds

**Parameters:** None

### C.3.20 cleanup of aborted process

When a process spawn is terminated while the process spawning background is in the middle of spawning, the current session must wait until the pid of the new process is filled in. Once the pid is filled in, then the process spawn can be actually terminated.

**Wait Time:** Usually 3 seconds

| Parameter       | Description          |
|-----------------|----------------------|
| <i>location</i> | Location of the wait |

### C.3.21 control file parallel write

This event occurs while the session is writing physical blocks to all control files. This happens when:

- The session starts a control file transaction (to ensure the control files are up to date in case the session crashes before committing the control file transaction)
- The session commits a transaction to a control file
- Changing a generic entry in the control file, the new value is being written to all control files

**Wait Time:** The wait time is the time it takes to finish all writes to all control files

| Parameter       | Description                                                          |
|-----------------|----------------------------------------------------------------------|
| <i>files</i>    | The number of control files to which the session is writing          |
| <i>blocks</i>   | The number of blocks that the session is writing to the control file |
| <i>requests</i> | The number of I/O requests which the session wants to write          |

### C.3.22 control file sequential read

Reading from the control file. This happens often. For example, while:

- Making a backup of the control files
- Sharing information (between instances) from the control file
- Reading other blocks from the control files

- Reading the header block

**Wait Time:** The wait time is the elapsed time of the read

| Parameter     | Description                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>file#</i>  | The control file from which the session is reading                                                                                                                                        |
| <i>block#</i> | Block number in the control file from where the session starts to read. The block size is the physical block size of the port (usually 512 bytes, some UNIX ports have 1 or 2 Kilobytes). |
| <i>blocks</i> | The number of blocks that the session is trying to read                                                                                                                                   |

### C.3.23 control file single write

This wait is signaled while the control file's shared information is written to disk. This is an atomic operation protected by an enqueue (CF), so that only one session at a time can write to the entire database.

**Wait Time:** The wait time is the elapsed time of the write

| Parameter     | Description                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>file#</i>  | This identifies the control file to which the session is currently writing                                                                                                        |
| <i>block#</i> | Block number in the control file where the write begins. The block size is the as the physical block size of the port (usually 512 bytes, some UNIX ports have 1 or 2 Kilobytes). |
| <i>blocks</i> | The number of blocks that the session is trying to write                                                                                                                          |

### C.3.24 cursor: mutex S

A session waits on this event when it is requesting a mutex in shared mode, when another session is currently holding a this mutex in exclusive mode on the same cursor object.

| Parameter | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                 |
| <i>P2</i> | Mutex value (top 2 bytes contain SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps                                                        |

### C.3.25 cursor: mutex X

The session requests the mutex for a cursor object in exclusive mode, and it must wait because the resource is busy. The mutex is busy because either the mutex is being held in exclusive mode by another session or the mutex is being held shared by one or more sessions. The existing mutex holder(s) must release the mutex before the mutex can be granted exclusively.

| Parameter | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                 |
| <i>P2</i> | Mutex value (top 2 bytes contain SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps |

### C.3.26 cursor: pin S

A session waits on this event when it wants to update a shared mutex pin and another session is currently in the process of updating a shared mutex pin for the same cursor object. This wait event should rarely be seen because a shared mutex pin update is very fast.

**Wait Time:** Microseconds

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                  |
| <i>P2</i> | Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps                                                         |

### C.3.27 cursor: pin S wait on X

A session waits for this event when it is requesting a shared mutex pin and another session is holding an exclusive mutex pin on the same cursor object.

**Wait Time:** Microseconds

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                  |
| <i>P2</i> | Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps                                                         |

### C.3.28 cursor: pin X

A session waits on this event when it is requesting an exclusive mutex pin for a cursor object and it must wait because the resource is busy. The mutex pin for a cursor object can be busy either because a session is already holding it exclusive, or there are one or more sessions which are holding shared mutex pin(s). The exclusive waiter must wait until all holders of the pin for that cursor object have released it, before it can be granted.

**Wait Time:** Microseconds

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                  |
| <i>P2</i> | Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps                                                         |

### C.3.29 db file async I/O submit

When asynchronous I/O is available, this wait event captures any time spent in submitting I/Os to the underlying storage.

#### See Also:

"db file parallel write"

### C.3.30 db file parallel read

This happens during recovery. It can also happen during buffer prefetching, as an optimization (rather than performing multiple single-block reads). Database blocks that must be changed as part of recovery are read in parallel from the database.

**Wait Time:** Wait until all of the I/Os are completed

| Parameter       | Description                                                                       |
|-----------------|-----------------------------------------------------------------------------------|
| <i>files</i>    | This indicates the number of files to which the session is reading                |
| <i>blocks</i>   | This indicates the total number of blocks to be read                              |
| <i>requests</i> | This indicates the total number of I/O requests, which will be the same as blocks |

### C.3.31 db file parallel write

This event occurs in the DBWR. It indicates the time that DBWR spends waiting for I/O completion.

If asynchronous I/O is available, then the db file async I/O submit wait event captures any time spent in submitting I/Os to the underlying storage.

When asynchronous I/O is not available, db file parallel write captures the time spent during submit and reap.

**Wait Time:** While there are outstanding I/Os, DBWR waits for some of the writes to complete. DBWR does not wait for all of the outstanding I/Os to complete.

| Parameter        | Description                                                                                |
|------------------|--------------------------------------------------------------------------------------------|
| <i>requests</i>  | This indicates the total number of I/O requests, which will be the same as blocks          |
| <i>interrupt</i> |                                                                                            |
| <i>timeout</i>   | This indicates the timeout value in hundredths of a second to wait for the I/O completion. |

 **See Also:**

- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems
- ["db file async I/O submit"](#)

### C.3.32 db file scattered read

Similar to the "db file sequential read" wait event, except that the session is reading multiple data blocks.

**Wait Time:** The wait time is the actual time it takes to do all of the I/Os

| Parameter     | Description                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------|
| <i>file#</i>  | See <a href="#">"file#"</a>                                                                             |
| <i>block#</i> | See <a href="#">"block#"</a>                                                                            |
| <i>blocks</i> | The number of blocks that the session is trying to read from the <i>file#</i> starting at <i>block#</i> |

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems
- *Oracle Database Performance Tuning Guide* about potential causes for this wait event

### C.3.33 db file sequential read

The session waits while a sequential read from the database is performed. This event is also used for rebuilding the control file, dumping data file headers, and getting the database file headers.

**Wait Time:** The wait time is the actual time it takes to do the I/O

| Parameter     | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| <i>file#</i>  | See <a href="#">"file#"</a>                                                   |
| <i>block#</i> | See <a href="#">"block#"</a>                                                  |
| <i>blocks</i> | This is the number of blocks that the session is trying to read (should be 1) |

**See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about how this wait event can help identify I/O problems
- *Oracle Database Performance Tuning Guide* about potential causes for this wait event

### C.3.34 db file single write

This event is used to wait for the writing of the file headers.

**Wait Time:** The wait time is the actual time it takes to do the I/O

| Parameter     | Description                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                                                                              |
| <i>block#</i> | See " <a href="#">block#</a> "                                                                             |
| <i>blocks</i> | This is the number of blocks that the session is trying to write in <i>file#</i> starting at <i>block#</i> |

**See Also:**

- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems

### C.3.35 DFS lock handle

The session waits for the lock handle of a global lock request. The lock handle identifies a global lock. With this lock handle, other operations can be performed on this global lock (to identify the global lock in future operations such as conversions or release). The global lock is maintained by the DLM.

**Wait Time:** The session waits in a loop until it has obtained the lock handle from the DLM. Inside the loop there is a wait of 0.5 seconds.

| Parameter   | Description                           |
|-------------|---------------------------------------|
| <i>name</i> | See " <a href="#">name and type</a> " |
| <i>mode</i> | See " <a href="#">mode</a> "          |
| <i>id1</i>  | See " <a href="#">id1</a> "           |
| <i>id2</i>  | See " <a href="#">id2</a> "           |

### C.3.36 direct path read

During Direct Path operations the data is asynchronously read from the database files. At some stage the session needs to make sure that all outstanding asynchronous I/O have been completed to disk. This can also happen if during a direct read no more slots are available to store outstanding load requests (a load request could consist of multiple I/Os).

**Wait Time:** 10 seconds. The session will be posted by the completing asynchronous I/O. It will never wait the entire 10 seconds. The session waits in a tight loop until all outstanding I/Os have completed.

| Parameter                 | Description                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------|
| <i>descriptor address</i> | This is a pointer to the I/O context of outstanding direct I/Os on which the session is currently waiting |
| <i>first dba</i>          | The dba of the oldest I/O in the context referenced by the descriptor address                             |
| <i>block cnt</i>          | Number of valid buffers in the context referenced by the descriptor address                               |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.37 direct path sync

During Direct Path write operations the data is asynchronously written to the database files. At some point the session needs to ensure that all outstanding asynchronous I/O have been completed to disk. On UNIX the `fsync` command, which synchronizes data to disk, is issued to confirm that all the writes have completed and the data is all on disk.

**Wait Time:** The time taken for the `fsync` operation to complete, which normally is the time taken to complete the outstanding I/Os.

| Parameters   | Description                       |
|--------------|-----------------------------------|
| <i>file#</i> | See " <a href="#">file#</a> "     |
| <i>flags</i> | Flags used for debugging purposes |

### C.3.38 direct path write

During Direct Path operations, the data is asynchronously written to the database files. At some stage the session needs to make sure that all outstanding asynchronous I/O have been completed to disk. This can also happen if, during a direct write, no more slots are available to store outstanding load requests (a load request could consist of multiple I/Os).

**Wait Time:** 10 seconds. The session will be posted by the completing asynchronous I/O. It will never wait the entire 10 seconds. The session waits in a tight loop until all outstanding I/Os have completed.

| Parameter                 | Description                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------|
| <i>descriptor address</i> | This is a pointer to the I/O context of outstanding direct I/Os on which the session is currently waiting |
| <i>first dba</i>          | The dba of the oldest I/O in the context referenced by the descriptor address                             |
| <i>block cnt</i>          | Number of valid buffers in the context referenced by the descriptor address                               |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this parameter

## C.3.39 Disk file operations I/O

This event is used to wait for disk file operations (for example, open, close, seek, and resize). It is also used for miscellaneous I/O operations such as block dumps and password file accesses.

**Wait Time:** The wait time is the actual time it takes to do the I/O

| Parameter            | Description                                                |
|----------------------|------------------------------------------------------------|
| <i>FileOperation</i> | Type of file operation                                     |
| <i>fileno</i>        | File identification number                                 |
| <i>filetype</i>      | Type of file (for example, log file, data file, and so on) |

## C.3.40 dispatcher shutdown

During shutdown immediate or normal, the shutdown process must wait for all the dispatchers to shutdown. As each dispatcher is signaled, the session that causes the shutdown waits on this event until the requested dispatcher is no longer running.

**Wait Time:** 1 second

| Parameter     | Description                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>waited</i> | Indicates the cumulative wait time. After 5 minutes, the session writes to the alert and trace files to indicate that there might be a problem. |

**See Also:**

*Oracle Database SQL Language Reference* for information about shutting down a dispatcher using `SHUTDOWN` clause of the `SQL ALTER SYSTEM` statement

### C.3.41 dispatcher timer

This basically means that the dispatcher is idle and waiting for some work to arrive.

**Wait Time:** 60 seconds

| Parameter         | Description                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>sleep time</i> | The intended sleep time. The dispatcher will return to work sooner if it is posted by either data arriving on the network or by a post from a shared server process to send data back to the client. |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.42 dupl. cluster key

It is possible for a race condition to occur when creating a new cluster key. If it is found that another process has put the cluster key into the data/index block, then the session waits and retries. The retry should then find a valid cluster key.

**Wait Time:** 0.01 seconds

| Parameter  | Description                                                                   |
|------------|-------------------------------------------------------------------------------|
| <i>dba</i> | The dba of the block into which the session is trying to insert a cluster key |

### C.3.43 enq: OW - initialization

A session will wait on this event if it is trying to initialize the database wallet, and another session has already begun an initialization.

**Wait Time:** Total time necessary to initialize the wallet context

**Parameters:** None

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about the potential causes of an enqueue wait event

### C.3.44 enq: OW - termination

A session will wait on this event if it is trying to terminate the database wallet, and another session has already begun a termination.

**Wait Time:** Total time necessary to deallocate memory used by the wallet context and terminate the context.

**Parameters:** None

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about the potential causes of an enqueue wait event

### C.3.45 enq: SV - contention

A session is accessing a sequence number from an ordered sequence object.

**Wait Time:** The wait time is the actual time waited until the requested sequence number is acquired.

| Parameter  | Description      |
|------------|------------------|
| <i>id1</i> | Sequence object# |

#### See Also:

*Oracle Database SQL Language Reference* for more information about sequences

### C.3.46 enq: TX - index contention

Occurs when a transaction inserting a row in an index has to wait for the end of an index block split being done by another transaction.

### C.3.47 enq: TX - row lock (HIGH priority)

This wait event occurs when a transaction with **HIGH** priority is waiting for a row lock being held by another transaction.

This wait event is useful when configuring Priority Transactions. You can observe the statistics for this wait event to determine whether the wait time for **HIGH** priority transactions is appropriate for your environment.

**Wait Time:** The amount of time specified by the `PRIORITY_TXNS_HIGH_WAIT_TARGET` initialization parameter.

| Parameter       | Description                           |
|-----------------|---------------------------------------|
| <i>name</i>     | See " <a href="#">name and type</a> " |
| <i>mode</i>     | See " <a href="#">mode</a> "          |
| <i>usn</i> <<16 | Undo segment number                   |
| <i>slot</i>     | Slot number                           |
| <i>sequence</i> | Sequence number                       |

 **See Also:**

- *Oracle Database Administrator's Guide* for information about configuring Priority Transactions
- "[PRIORITY\\_TXNS\\_HIGH\\_WAIT\\_TARGET](#)"

### C.3.48 enq: TX - row lock (LOW priority)

This wait event occurs when a transaction with `LOW` priority is waiting for a row lock being held by another transaction.

This wait event is useful when configuring Priority Transactions. You can observe the statistics for this wait event to determine how long `LOW` priority transactions are waiting for row locks.

**Wait Time:** Total time necessary to obtain the row lock

| Parameter       | Description                           |
|-----------------|---------------------------------------|
| <i>name</i>     | See " <a href="#">name and type</a> " |
| <i>mode</i>     | See " <a href="#">mode</a> "          |
| <i>usn</i> <<16 | Undo segment number                   |
| <i>slot</i>     | Slot number                           |
| <i>sequence</i> | Sequence number                       |

 **See Also:**

- *Oracle Database Administrator's Guide* for information about configuring Priority Transactions

### C.3.49 enq: TX - row lock (MEDIUM priority)

This wait event occurs when a transaction with `MEDIUM` priority is waiting for a row lock being held by another transaction.

This wait event is useful when configuring Priority Transactions. You can observe the statistics for this wait event to determine whether the wait time for `MEDIUM` priority transactions is appropriate for your environment.

**Wait Time:** The amount of time specified by the `PRIORITY_TXNS_MEDIUM_WAIT_TARGET` initialization parameter.

| Parameter       | Description                           |
|-----------------|---------------------------------------|
| <i>name</i>     | See " <a href="#">name and type</a> " |
| <i>mode</i>     | See " <a href="#">mode</a> "          |
| <i>usn</i> <<16 | Undo segment number                   |
| <i>slot</i>     | Slot number                           |
| <i>sequence</i> | Sequence number                       |

 **See Also:**

- *Oracle Database Administrator's Guide* for information about configuring Priority Transactions
- "[PRIORITY\\_TXNS\\_MEDIUM\\_WAIT\\_TARGET](#)"

## C.3.50 enq: TX - row lock contention

This wait event can occur for several reasons.

- If one user is wanting to update or delete a row or rows that another session is modifying. The session holding the lock will release it when it performs a COMMIT or ROLLBACK.
- If a session is waiting due to potential duplicates in a UNIQUE index. If two sessions try to insert the same key value, the second session has to wait to see if an ORA-0001 should be raised or not. The session holding the lock will release it when it performs a COMMIT or ROLLBACK.
- If a session is waiting due to a shared bitmap index fragment. Bitmap indexes index key values and a range of rowids. Each entry in a bitmap index can cover many rows in the actual table. If two sessions want to update rows covered by the same bitmap index fragment, then the second session waits for the first transaction to either COMMIT or ROLLBACK by waiting for the TX lock.

## C.3.51 enqueue

The session is waiting for a local enqueue.

The wait depends on the name of the enqueue (see [Oracle Enqueue Names](#)).

**Wait Time:** Depends on the enqueue name

| Parameter   | Description                           |
|-------------|---------------------------------------|
| <i>name</i> | See " <a href="#">name and type</a> " |
| <i>mode</i> | See " <a href="#">mode</a> "          |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about the potential causes of an enqueue wait event

## C.3.52 flashback buf free by RVWR

This wait event only occurs when Flashback Database is turned on. A session waits for recovery writer (RVWR) to write flashback data to the flashback logs on disk because the buffers are full. Until RVWR can free up the buffers, the session may need to wait.

If this event becomes a top wait event for the database, it is typically because the file system or storage system for the Fast Recovery Area does not support enough bandwidth for Oracle to write the flashback database logs. Refer to the Flashback Database section in *Oracle Database Backup and Recovery User's Guide* for tuning considerations.

**Wait Time:** 1 second

**Parameters:** None

## C.3.53 flashback log file sync

Waits for flashback database data to be written to disk.

**Wait Time:** Includes RVWR writing the flashback database data and posting this process

**Parameters:** None

## C.3.54 free buffer waits

This wait event can occur for several reasons.

- All buffer gets have been suspended. This could happen when a file was read-only and is now read/write. All the existing buffers must be invalidated since they are not linked to lock elements (needed when mounted parallel (shared)). So cache buffers are not assigned to data block addresses until the invalidation is finished.
- The session moved some dirty buffers to the dirty queue and now this dirty queue is full. The dirty queue must be written first. The session will wait on this event and try again to find a free buffer.
- This also happens after inspecting **free buffer inspected** buffers. If no free buffer is found, Oracle waits for one second, and then tries to get the buffer again (depends on the context). For more information, see [free buffer inspected](#).

**Wait Time:** 1 second

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |

**See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* about potential causes of this wait event

## C.3.55 free global transaction table entry

The session is waiting for a free slot in the global transaction table (used by the Distributed Database option). It will wait for 1 second and try again.

**Wait Time:** 1 second

| Parameter    | Description                                                                               |
|--------------|-------------------------------------------------------------------------------------------|
| <i>tries</i> | The number of times the session tried to find a free slot in the global transaction table |

## C.3.56 free process state object

Used during the creation of a process. The session will scan the process table and look for a free process slot. If none can be found, PMON is posted to check if all the processes currently in the process table are still running. If there are terminated processes, then PMON will clean them and make the process slot available to new processes. The waiting process will then rescan the process table to find the new slot.

**Wait Time:** 1 second

**Parameters:** None

## C.3.57 gc buffer busy acquire

This event indicates that the requested buffer was globally busy in the cluster, because it had already been requested from a remote instance by another local client.

**Wait Time:** The wait time is the actual time it took to resolve the buffer contention.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

## C.3.58 gc buffer busy release

This event indicates that the requested buffer was globally busy in the cluster, because the requested buffer had been transferred away by a remote instance and needed to be requested again.

**Wait Time:** The wait time is the actual time it took to resolve the buffer contention.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.59 gc cr block 2-way

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and 2 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.60 gc cr block 3-way

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and 3 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.61 gc cr block busy

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, but the request had to be put on hold at the serving instance.

This could happen when a dirty buffer had to be transferred, in which case REDO needs to be flushed before the Cache Fusion transfer could be processed. This could also happen if the requested buffer was being held by another process on the remote instance. The serving instance would transfer the requested buffer once the REDO flush is complete, or once the buffer is released by the holding process.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter    | Description                   |
|--------------|-------------------------------|
| <i>file#</i> | See " <a href="#">file#</a> " |

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.62 gc cr block congested

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, but the request was queued at the serving instance for too long.

This could happen when the GCS server processes (LMSn and LMnn) are very busy due to having a high volume of incoming Cache Fusion requests. Increasing the GCS server processes (GCS\_SERVER\_PROCESSES) is usually the remedy to alleviate congestion for the GCS server processes.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

**See Also:**

"[GCS\\_SERVER\\_PROCESSES](#)"

### C.3.63 gc cr block direct read

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and the buffer was directly read from the remote cache utilizing the RDMA protocol.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.64 gc cr block lost

This event indicates that a Cache Fusion consistent read (CR) buffer request resulted in a potentially lost block. The request will be re-tried automatically.

This is typically caused by unreliable interconnect network protocols, usually when the network is congested and packets are dropped. It can also be the result of interconnect hardware errors or simply the result of an overloaded system, or a sign that a public network path is used for Cache Fusion instead of a private network.

**Wait Time:** The wait time is the actual time it took to detect the potentially lost block.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.65 gc cr grant read-mostly invalidation

The client is performing a DML on a read-mostly object, which requires a read lock invalidation on all other instances.

**Wait Time:** The wait time is the actual time it takes to complete the invalidation on all other instances.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.66 gc cr multi block grant

This event indicates that a client requested multiple consistent read (CR) buffers from another instance in the cluster, and the request resulted in multiple lock grants from the remote instance.

**Wait Time:** The wait time is the actual time waited for the multi-block request to complete.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.67 gc cr multi block mixed

This event indicates that a client requested multiple consistent read (CR) buffers from another instance in the cluster, and the remote instance returned a mixture of blocks and grants.

**Wait Time:** The wait time is the actual time waited for the multi-block request to complete.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

## C.3.68 gc cr request

This event is used for ongoing Cache Fusion consistent read (CR) buffer requests. The event is renamed to reflect the actual outcome of the request (example: "gc cr block 2-way") upon completion of the wait. Therefore, these events will not be reported in AWR reports, but may appear in ASH data.

**Wait Time:** The wait time is the actual time waited for the request.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

## C.3.69 gc current block 2-way

This event indicates that the requested current buffer was transferred from another instance in the cluster, and 2 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

## C.3.70 gc current block 3-way

This event indicates that the requested current buffer was transferred from another instance in the cluster, and 3 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

## C.3.71 gc current block busy

This event indicates that the requested current buffer was transferred from another instance in the cluster, but the request had to be put on hold at the serving instance.

This could happen when a dirty buffer had to be transferred, in which case REDO needs to be flushed before the Cache Fusion transfer could be processed. This could also happen if the

requested buffer was being held by another process on the remote instance. The serving instance would transfer the requested buffer once the REDO flush is complete, or once the buffer is released by the holding process.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

### C.3.72 gc current block congested

This event indicates that the requested current buffer was transferred from another instance in the cluster, but the request was queued at the serving instance for too long.

This could happen when the GCS server processes (LMS) are very busy due to having a high volume of incoming Cache Fusion requests. Increasing the GCS server processes (`GCS_SERVER_PROCESSES`) is usually the remedy to alleviate congestion for the GCS server processes.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

#### See Also:

["GCS\\_SERVER\\_PROCESSES"](#)

### C.3.73 gc current block direct read

This event indicates that the requested current buffer was transferred from another instance in the cluster, and the buffer was directly read from the remote cache utilizing the RDMA protocol.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.74 gc current block lost

This event indicates that a Cache Fusion current buffer request resulted in a potentially lost block. The request will be re-tried automatically.

This is typically caused by unreliable interconnect network protocols, usually when the network is congested and packets are dropped. It can also be the result of interconnect hardware errors or simply the result of an overloaded system, or a sign that a public network path is used for Cache Fusion instead of a private network.

**Wait Time:** The wait time is the actual time it took to detect the potentially lost block.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

### C.3.75 gc current request

This event is used for ongoing Cache Fusion current buffer requests. The event is renamed to reflect the actual outcome of the request (example: "gc current block 2-way") upon completion of the wait. Therefore, these events will not be reported in AWR reports, but may appear in ASH data.

**Wait Time:** The wait time is the actual time waited for the request.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

### C.3.76 inactive session

This event is used for switching and terminating sessions.

- Switching sessions

If a timeout period has been specified, then wait that amount of time for the session to be detached.

- Terminating sessions

From either `KILL SESSION` or internal request. Having posted a session that it should terminate itself, wait for up to 1 minute for the session to terminate.

**Wait Time:** 1 second

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

## C.3.77 inactive transaction branch

The session waits for a transaction branch that is currently used by another session.

**Wait Time:** 1 second

| Parameter      | Description                                                           |
|----------------|-----------------------------------------------------------------------|
| <i>branch#</i> | The serial number of the transaction for which the session is waiting |
| <i>waited</i>  | See " <a href="#">waited</a> "                                        |

## C.3.78 index split completion

This event occurs when a transaction inserting a row into an index must wait for the end of an index block split being performed by another transaction. In an Oracle RAC database, some index split waits will use this wait event in lieu of the "enq: TX - index contention" wait event.

**Wait Time:** The wait time is the actual time waited for the split to complete.

| Parameter        | Description                                                         |
|------------------|---------------------------------------------------------------------|
| <i>undo seg#</i> | The rollback segment ID                                             |
| <i>slot#</i>     | The slot ID inside the rollback segment                             |
| <i>wrap#</i>     | The sequence number that is incremented for each transaction        |
| <i>count</i>     | The number of times that the session has waited on this transaction |

## C.3.79 instance state change

The session waits for SMON to enable or disable cache or transaction recovery. This usually happens during `ALTER DATABASE OPEN` or `CLOSE`.

**Wait Time:** Wait time depends on the amount of time the action takes (that is, the amount of recovery needed)

| Parameter     | Description                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>layer</i>  | This value can be 1 or 2. If 1, it means that the transaction layer wants transaction recovery to be performed. If 2, it means that cache recovery will be performed. |
| <i>value</i>  | This value can be 0 (disable) or 1 (enable)                                                                                                                           |
| <i>waited</i> | The number of seconds waited so far                                                                                                                                   |

## C.3.80 io done

The session waits for an I/O to complete or it waits for a worker process to become available to submit the I/O request. This event occurs on platforms that do not support asynchronous I/O.

**Wait Time:** 50 milliseconds

| Parameter      | Description                  |
|----------------|------------------------------|
| <i>msg ptr</i> | A pointer to the I/O request |

### C.3.81 ksxr wait for mount shared

The cross instance broadcast facility of this Oracle instance is waiting for the database mount in shared mode to complete.

**Wait Time:** The time taken for the instance to mount. An indefinite wait on this event implies that the instance startup is hanging.

### C.3.82 ktm: instance recovery

The session waits for SMON to finish the instance, transaction recovery, or sort segment cleanup.

**Wait Time:** The wait time can vary and depends on the amount of recovery needed

| Parameter            | Description                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>undo segment#</i> | If the value is 0, SMON is probably performing instance recovery. If P1 > 0, use this query to find the undo segment:<br><br><pre>select *<br/>from v\$rollstat<br/>where usn = undo segment#;</pre> |

### C.3.83 latch activity

This event is used as part of the process of determining whether a latch must be cleaned.

**Wait Time:** 0.05 to 0.1 seconds

| Parameter       | Description                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>address</i>  | The address of the latch that is being checked                                                                                                                                                       |
| <i>number</i>   | The latch number of the latch that has activity. To find more information on the latch, use the following SQL statement:<br><br><pre>select *<br/>from v\$latchname<br/>where latch# = number;</pre> |
| <i>process#</i> | If this is 0, it is the first phase of the in-flux tests                                                                                                                                             |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about latch wait events

## C.3.84 latch free

The process waits for a latch that is currently busy (held by another process).

**Wait Time:** The wait time increases exponentially and does not include spinning on the latch (active waiting). The maximum wait time also depends on the number of latches that the process is holding. There is an incremental wait of up to 2 seconds.

| Parameter      | Description                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>address</i> | The address of the latch for which the process is waiting                                                                                                                                                                       |
| <i>number</i>  | The latch number that indexes in the <code>V\$LATCHNAME</code> view. To find more information on the latch, use the following SQL statement:<br><br><pre>select *<br/>from v\$latchname<br/>where latch# = <i>number</i>;</pre> |
| <i>tries</i>   | A count of the number of times the process tried to get the latch (slow with spinning) and the process has to sleep                                                                                                             |

### See Also:

*Oracle Database Performance Tuning Guide* for more information about latch wait events

## C.3.85 latch: redo copy

Redo copy latches are acquired by sessions in order to write changes into the redo log buffer and by the LGWR process to ensure that there are no current writers before it copies data from the buffer to the redo log.

## C.3.86 library cache load lock

The session tries to find the load lock for the database object so that it can load the object. The load lock is always obtained in Exclusive mode, so that no other process can load the same object. If the load lock is busy the session will wait on this event until the lock becomes available.

**Wait Time:** 3 seconds (1 second for PMON)

| Parameter             | Description                                                |
|-----------------------|------------------------------------------------------------|
| <i>object address</i> | Address of the object being loaded                         |
| <i>lock address</i>   | Address of load lock being used                            |
| <i>mask</i>           | Indicates which data pieces of the object that must loaded |

## C.3.87 library cache lock

This event controls the concurrency between clients of the library cache. It acquires a lock on the object handle so that either:

- One client can prevent other clients from accessing the same object
- The client can maintain a dependency for a long time (for example, no other client can change the object)

This lock is also obtained to locate an object in the library cache.

**Wait Time:** 3 seconds (1 second for PMON)

| Parameter             | Description                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>handle address</i> | Address of the object being loaded                                                                              |
| <i>lock address</i>   | Address of the load lock being used. This is not the same thing as a latch or an enqueue, it is a State Object. |
| <i>mode</i>           | Indicates the data pieces of the object which must be loaded                                                    |
| <i>namespace</i>      | See " <a href="#">namespace</a> "                                                                               |

### See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

## C.3.88 library cache pin

This event manages library cache concurrency. Pinning an object causes the heaps to be loaded into memory. If a client wants to modify or examine the object, the client must acquire a pin after the lock.

**Wait Time:** 3 seconds (1 second for PMON)

| Parameter             | Description                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------|
| <i>handle address</i> | Address of the object being loaded                                                                                        |
| <i>pin address</i>    | Address of the load lock being used. This is not the same thing as a latch or an enqueue, it is basically a State Object. |
| <i>mode</i>           | Indicates which data pieces of the object that must be loaded                                                             |
| <i>namespace</i>      | See " <a href="#">namespace</a> "                                                                                         |

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

## C.3.89 library cache shutdown

The process shutting down the instance waits for sessions to complete before proceeding with library cache shutdown.

## C.3.90 library cache: mutex X

Library cache mutexes protect hash buckets within the shared pool. Each hash bucket contains a number of cursors. The mutex must be held in exclusive mode before any of the structures that it protects can be changed. This wait event is often associated with high parse activity.

## C.3.91 Log archive I/O

Used local archiving of online redo logs (for a production database) or standby redo logs (for a standby database). When the archiving process exhausts its I/O buffers because all of them are being used for on-going I/O's, the wait for an available I/O buffer is captured in this system wait event.

**Wait Time:** Depends on the speed of the disks

**Parameters:** None

## C.3.92 log buffer space

Waiting for space in the log buffer because the session is writing data into the log buffer faster than LGWR can write it out. Consider making the log buffer bigger if it is small, or moving the log files to faster disks such as striped disks.

**Wait Time:** Usually 1 second, but 5 seconds if it is waiting for a Switch Logfile to complete

**Parameters:** None

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

### C.3.93 log file parallel write

Writing redo records to the redo log files from the log buffer.

**Wait Time:** Time it takes for the I/Os to complete. Even though redo records are written in parallel, the parallel write is not complete until the last I/O is on disk.

| Parameter       | Description                    |
|-----------------|--------------------------------|
| <i>files</i>    | Number of files to be written  |
| <i>blocks</i>   | Number of blocks to be written |
| <i>requests</i> | Number of I/O requests         |

#### See Also:

*Oracle Database Performance Tuning Guide* for information about how this wait event can help identify I/O problems

### C.3.94 log file sequential read

Waiting for the read from this logfile to return. This is used to read redo records from the log file.

**Wait Time:** Time it takes to complete the physical I/O (read)

| Parameter     | Description                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------|
| <i>log#</i>   | The relative sequence number of the logfiles within a log group (used only when dumping the logfiles) |
| <i>block#</i> | See " <a href="#">block#</a> "                                                                        |
| <i>blocks</i> | The number of blocks to read                                                                          |

### C.3.95 log file single write

Waiting for the write to this logfile to complete. This event is used while updating the header of the logfile. It is signaled when adding a log file member and when incrementing sequence numbers.

**Wait Time:** Time it takes for the physical I/O (write) to complete

| Parameter     | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| <i>log#</i>   | This is the number of the group/log to which the session is currently writing |
| <i>block#</i> | See " <a href="#">block#</a> "                                                |
| <i>blocks</i> | The number of blocks to write                                                 |

### C.3.96 log file switch (archiving needed)

Waiting for a log switch because the log that the LGWR will be switching into has not been archived yet. Check the alert log to ensure that archiving has not stopped due to a failed archive write. To speed archiving, consider adding more archive processes or putting the archive files on striped disks.

**Wait Time:** 1 second

**Parameters:** None

### C.3.97 log file switch (checkpoint incomplete)

Waiting for a log switch because the session cannot wrap into the next log. Wrapping cannot be performed because the checkpoint for that log has not completed.

**Wait Time:** 1 second

**Parameters:** None

### C.3.98 log file switch (clearing log file)

Waiting for a log switch because the log is being cleared due to a `CLEAR LOGFILE` command or implicit clear logfile executed by recovery.

**Wait Time:** 1 second

**Parameters:** None

### C.3.99 log file switch (private strand flush incomplete)

User sessions trying to generate redo, wait on this event when LGWR waits for DBWR to complete flushing redo from IMU buffers into the log buffer; when DBWR is complete LGWR can then finish writing the current log, and then switch log files.

**Wait Time:** 1 second

**Parameters:** None

### C.3.100 log file switch completion

Waiting for a log switch to complete.

**Wait Time:** 1 second

**Parameters:** None

### C.3.101 log file sync

When a user session commits, the session's redo information must be flushed to the redo logfile. The user session will post the LGWR to write the log buffer to the redo log file. When the LGWR has finished writing, it will post the user session.

**Wait Time:** The wait time includes the writing of the log buffer and the post.

| Parameter      | Description                                                                        |
|----------------|------------------------------------------------------------------------------------|
| <i>buffer#</i> | The number of the physical buffer in the redo log buffer that must be synchronized |

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for information about potential causes of this wait event

## C.3.102 log switch/archive

Used as part of the `ALTER SYSTEM ARCHIVE LOG CHANGE scn` statement. The session waits for the current log from all open threads to be archived.

**Wait Time:** Wait for up to 10 seconds

| Parameter      | Description                                                                 |
|----------------|-----------------------------------------------------------------------------|
| <i>thread#</i> | The thread number of the thread that is currently archiving its current log |

## C.3.103 optimizer stats update retry

When concurrent sessions try to update optimizer statistics for the same object, all of them except the one that successfully acquired all necessary locks/pins on the library/row cache entries, wait on this wait event and then retry locking after a short period of time. In addition to explicit statistics gathering and maintenance operations using the `DBMS_STATS` package, Oracle database itself may try to update statistics for some objects, either on behalf of the user or for its own maintenance purposes.

**Wait Time:** 10 ms

**Parameters:** None

## C.3.104 parallel recovery change buffer free

The parallel recovery coordinator is waiting for a change mapping buffer to be released by one of the recovery workers.

**Wait Time:** 100ms

**Parameters:** None

## C.3.105 parallel recovery control message reply

The parallel recovery coordinator is waiting for all recovery workers to respond to a synchronous control message.

**Wait Time:** 100ms

**Parameters:** None

### C.3.106 parallel recovery coord send blocked

The parallel recovery coordinator cannot send a redo change message because the recovery worker is still actively applying redo that it has already received and has not yet released the channel.

**Wait Time:** 100ms

**Parameters:** None

### C.3.107 parallel recovery coord wait for reply

The parallel recovery coordinator is waiting for all recovery workers to exit.

**Wait Time:** 100ms

**Parameters:** None

### C.3.108 parallel recovery coordinator waits for slave cleanup

The parallel recovery coordinator is waiting for all recovery workers to exit gracefully.

**Wait Time:** 10ms

**Parameters:** None

### C.3.109 parallel recovery read buffer free

The parallel recovery coordinator is waiting for a log read buffer to be released by all recovery workers. Only after every recovery worker finishes applying redo from a log read buffer, can the buffer be used by the coordinator to issue the next log read.

**Wait Time:** 100ms

**Parameters:** None

### C.3.110 parallel recovery slave next change

A parallel recovery worker is idle and waiting for the next change message from the coordinator.

**Wait Time:** 100ms

**Parameters:** None

### C.3.111 pending global transaction(s)

This event should happen only during testing. The session waits for pending transactions to clear.

**Wait Time:** 30 seconds

| Parameter    | Description                                                                  |
|--------------|------------------------------------------------------------------------------|
| <i>scans</i> | Number of times the session has scanned the <code>PENDING_TRANS</code> table |

### C.3.112 pipe get

The session waits for a message to be received on the pipe or for the pipe timer to expire.

**Wait Time:** There is a 5 second wake up (check) and the pipe timer set by the user

| Parameter             | Description                                   |
|-----------------------|-----------------------------------------------|
| <i>handle address</i> | The library cache object handle for this pipe |
| <i>buffer length</i>  | The length of the buffer                      |
| <i>timeout</i>        | The pipe timer set by the user                |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.113 pipe put

The session waits for the pipe send timer to expire or for space to be made available in the pipe.

**Wait Time:** There is the 5 second wakeup (check) and the user-supplied timeout value

| Parameter             | Description                                                        |
|-----------------------|--------------------------------------------------------------------|
| <i>handle address</i> | The library cache object handle for this pipe                      |
| <i>record length</i>  | The length of the record or buffer that has been put into the pipe |
| <i>timeout</i>        | The pipe timer set by the user                                     |

### C.3.114 PL/SQL lock timer

This event is called through the `DBMS_LOCK.SLEEP` procedure. This event will most likely originate from procedures written by a user.

**Wait Time:** The wait time is in hundredths of seconds and depends on the user context

| Parameter       | Description                                                                        |
|-----------------|------------------------------------------------------------------------------------|
| <i>duration</i> | The duration that the user specified in the <code>DBMS_LOCK.SLEEP</code> procedure |

### C.3.115 pmon timer

This is the main wait event for PMON. When PMON is idle, it is waiting on this event.

**Wait Time:** Up to 3 seconds, if not posted before

| Parameter       | Description                                                |
|-----------------|------------------------------------------------------------|
| <i>duration</i> | The actual amount of time that the PMON is trying to sleep |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

## C.3.116 prior spawner clean up

When a prior process has died while spawning a background, the current process which is trying to spawn new a background must wait until the prior process state is cleaned up.

**Wait Time:** Usually 3 - 10 seconds

| Parameter          | Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <i>process_pid</i> | process identifier (see <code>V\$PROCESS.PID</code> ) of the process whose state must be cleaned up.        |
| <i>process_sno</i> | process serial number (see <code>V\$PROCESS.SERIAL#</code> ) of the process whose state must be cleaned up. |

## C.3.117 process startup

Wait for a shared server, Dispatcher, or other background process to start.

**Wait Time:** Wait up to 1 second for a background process to start. If timed out, then re-wait until 5 minutes have passed and signal an error. If the process has started, the event will acknowledge this.

| Parameter       | Description                                     |
|-----------------|-------------------------------------------------|
| <i>type</i>     | The process type that was started               |
| <i>process#</i> | The process number of the process being started |
| <i>waited</i>   | Cumulative time waited for the process to start |

## C.3.118 PX Deque wait

The process is waiting for a message during a parallel execute.

**Wait Time:** The wait time depends on how quickly the message arrives. Wait times can vary, but it will normally be a short period of time.

| Parameter        | Description                                          |
|------------------|------------------------------------------------------|
| <i>reason</i>    | The reason for dequeuing                             |
| <i>sleeptime</i> | The amount of time that the session slept            |
| <i>loop</i>      | The total number of times that the session has slept |

## C.3.119 PX qref latch

Each parallel execution process has a parallel execution qref latch, which must be acquired before the queue buffers can be manipulated.

**Wait Time:** Wait up to 1 second

| Parameter        | Description                                                           |
|------------------|-----------------------------------------------------------------------|
| <i>function</i>  | Indicates the type of wait that the session is doing                  |
| <i>sleeptime</i> | The amount of time that the session waits (in hundredths of a second) |
| <i>qref</i>      | The address of the process queue for which the session is waiting     |

## C.3.120 PX server shutdown

During normal or immediate shutdown the parallel execution servers are posted to shutdown cleanly. If any parallel execution servers are still running after 10 seconds, they are terminated.

**Wait Time:** Wait up to 0.5 seconds

| Parameter        | Description                                                         |
|------------------|---------------------------------------------------------------------|
| <i>nalive</i>    | The number of parallel execution servers that are still running     |
| <i>sleeptime</i> | The total sleeptime since the session started to wait on this event |
| <i>loop</i>      | The number of times the session waited for this event               |

## C.3.121 PX signal server

This event occurs only in Exclusive mode. The query coordinator is signaling the Query Workers that an error has occurred.

**Wait Time:** 0.5 seconds

| Parameter     | Description                                        |
|---------------|----------------------------------------------------|
| <i>serial</i> | The serial number of the worker process queue      |
| <i>error</i>  | The error that has occurred                        |
| <i>nbusy</i>  | The number of worker processes that are still busy |

## C.3.122 rdbms ipc message

The background processes (LGWR, DBWR, LMS0) use this event to indicate that they are idle and are waiting for the foreground processes to send them an IPC message to do some work.

**Wait Time:** Up to 3 seconds. The parameter *timeout* shows the true sleep time.

| Parameter      | Description                                                  |
|----------------|--------------------------------------------------------------|
| <i>timeout</i> | The amount of time that the session waits for an IPC message |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.123 rdbms ipc message block

This event indicates that all message blocks are in use and that the session had to wait for a message block to become available.

**Wait Time:** Wait up to 60 seconds

**Parameters:** None

### C.3.124 rdbms ipc reply

This event is used to wait for a reply from one of the background processes.

**Wait Time:** The wait time is specified by the user and is indicated by the parameter *timeout*.

| Parameter           | Description                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>from_process</i> | The background process for which the session is waiting. The wait is for a reply to an IPC message sent by the session. |
| <i>timeout</i>      | The amount of time in seconds that this process will wait for a reply                                                   |

### C.3.125 read by other session

This event occurs when a session requests a buffer that is currently being read into the buffer cache by another session. Prior to release 10.1, waits for this event were grouped with the other reasons for waiting for buffers under the 'buffer busy waits' event.

**Wait Time:** Time waited for the buffer to be read by the other session (in microseconds)

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.126 recovery active instance mapping setup

This event is used to track the time taken (in centiseconds) to set up recovery context on remote instances.

### C.3.127 recovery apply pending

This event tracks the time the logmerger process waited (in centiseconds) for apply workers to apply all pending changes up to a certain SCN.

### C.3.128 recovery cancel

This wait event is used to track the time taken (in centiseconds) to cancel multi instance media recovery.

### C.3.129 recovery checkpoint

This wait event tracks the time (in centiseconds) spent waiting for DBWR processes on all instances to write dirty buffers to disk up to a certain SCN.

### C.3.130 recovery file header update for checkpoint

This wait event tracks the time (in centiseconds) spent by MRP0 process waiting on logmerger to update file headers to record the latest checkpoint.

### C.3.131 recovery file header update for fuzziness

This wait event tracks the time taken (in centiseconds) to update file headers to record media recovery fuzziness.

### C.3.132 recovery marker apply

This wait event is used to track the time (in centiseconds) taken to process a recovery marker.

### C.3.133 recovery merge pending

This wait event is used to track the time spent (in centiseconds) by the MRP0 process waiting for remote logmergers to merge changes up to a certain SCN.

### C.3.134 recovery metadata latch

This wait event tracks the time taken (in centiseconds) to get the active DataGuard metadata update latch to advance a query SCN.

### C.3.135 recovery move influx buffers

This wait event is used to track the time spent (in centiseconds) waiting for all apply workers to move their influx buffers to the dirty queue.

### C.3.136 recovery read

A parallel recovery worker (or serial recovery process) is waiting for a batch of data block reads to complete.

**Wait Time:** Time it takes to complete the physical I/O (read)

**Parameters:** None

### C.3.137 recovery receive buffer free

This wait event is used to track the time (in centiseconds) spent by the receiver process on instance waiting for apply workers to apply changes from received buffers so that they can be freed for the next change.

### C.3.138 recovery remote file verification

This wait event tracks the time spent (in centiseconds) by the MRP0 process waiting for remote logmergers to finish file verification on remote instances.

### C.3.139 recovery send buffer free

This wait event is used to track the time spent (in centiseconds) by the sender process waiting for apply workers to apply changes from the local instance so that the buffer can be reused for new changes.

### C.3.140 recovery shutdown

This wait event is used to track the time (in centiseconds) taken for remote logmergers to shut down.

### C.3.141 Redo Transport Attach

Used to track the time spent (in centiseconds) doing Connect, Logon, and RFSATTACH for any network process.

#### See Also:

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.142 Redo Transport Close

Used to track the time spent (in centiseconds) by ARC*n*, NSS*n*, and TT*nn* processes doing RFS\_CLOSE and RFSRGSTR operations.

#### See Also:

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.143 Redo Transport Detach

Used to track the time spent (in centiseconds) doing RFSDETACH and Disconnect for *any* network process.

 **See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.144 Redo Transport Open

Used to track the time spent (in centiseconds) by ARC*n*, NSS*n*, and TT*nn* background processes doing RFSCREAT and RFSANNCE operations.

 **See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.145 Redo Transport Ping

Used to track the time spent (in centiseconds) by ARC*n* background processes doing RFSPING operations.

 **See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.146 Redo Transport Slave Startup

Used to track the time spent (in centiseconds) by LGWR doing NSS*n* and TT*nn* process startup and initialization.

### C.3.147 Redo Writer Remote Sync Complete

Used to track the time spent (in centiseconds) by LGWR reaping completed network writes to remote destinations.

### C.3.148 Redo Writer Remote Sync Notify

Used to track the time spent (in centiseconds) by LGWR issuing network writes to remote destinations.

### C.3.149 resmgr:become active

The session is waiting for a resource manager active session slot. This event occurs when the resource manager is enabled and the number of active sessions in the session's current consumer group exceeds the current resource plan's active session limit for the consumer group. To reduce the occurrence of this wait event, increase the active session limit for the session's current consumer group.

**Wait Time:** The time the session waited to be allocated an active session slot

| Parameter       | Description          |
|-----------------|----------------------|
| <i>location</i> | location of the wait |

### C.3.150 resmgr:cpu quantum

The session is waiting to be allocated a quantum of CPU. This event occurs when the resource manager is enabled and is throttling CPU consumption. To reduce the occurrence of this wait event, increase the CPU allocation for the sessions's current consumer group.

**Wait Time:** The time the session waited to acquire a CPU quantum

| Parameter                | Description                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>location</i>          | Location of the wait                                                                                                                                      |
| <i>Consumer Group ID</i> | Consumer group ID of the session waiting. This value is from the <code>CONSUMER_GROUP_ID</code> column in the <code>DBA_RSRC_CONSUMER_GROUPS</code> view. |

**See Also:**

["DBA\\_RSRC\\_CONSUMER\\_GROUPS"](#)

### C.3.151 resmgr: I/O rate limit

The session is waiting for I/O bandwidth to be available to issue I/Os. This event occurs when PDB I/O rate limits are enabled by setting the `MAX_IOPS` and/or `MAX_MBPS` parameters.

To reduce the occurrence of this wait event, the PDB I/O rate limit values need to be increased. This can be achieved by increasing the values of `MAX_IOPS` and `MAX_MBPS` or by removing the limits altogether by setting the parameter value to 0.

**Wait Time:** The time the session waited for the I/O bandwidth to become available.

| Parameter         | Description                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>P1: PDB_ID</i> | This the PDB ID of the PDB that has its I/O throttled because the <code>MAX_IOPS</code> or <code>MAX_MBPS</code> parameter was set for it. |

**See Also:**

- ["MAX\\_IOPS"](#)
- ["MAX\\_MBPS"](#)

## C.3.152 resmgr:pq queued

The session is waiting in the parallel statement queue.

**Wait Time:** The time the session waited for sufficient parallel query processes to become available to run this session with the requested degree of parallelism

| Parameter       | Description          |
|-----------------|----------------------|
| <i>location</i> | Location of the wait |

**See Also:**

*Oracle Database VLDB and Partitioning Guide* for more information about this wait event

## C.3.153 rolling migration: cluster quiesce

This is the wait event that instances wait on when cluster is about to start a rolling migration. The instances are waiting for any privileged operations that blocks rolling migration to complete before allowing rolling migration.

**Wait Time:** 1 second

| Parameter       | Description                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>location</i> | Its value will be 1 if the wait is for completion of the privileged operations so that a rolling upgrade/downgrade can start. Its value will be 2 if the wait is for completion of the rolling upgrade/downgrade on all the nodes in the cluster. |
| <i>waits</i>    | The number of seconds spent waiting at the current location.                                                                                                                                                                                      |

## C.3.154 row cache lock

The session is trying to get a data dictionary lock.

**Wait Time:** Wait up to 60 seconds.

| Parameter       | Description                                                               |
|-----------------|---------------------------------------------------------------------------|
| <i>cache id</i> | The <code>CACHE#</code> column value in the <code>V\$ROWCACHE</code> view |
| <i>mode</i>     | See <a href="#">"mode"</a>                                                |
| <i>request</i>  | The pipe timer set by the user                                            |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

## C.3.155 RVWR wait for flashback copy

Waits for a process to copy flashback database data into the flashback buffer, in order to write out the requested flashback data.

**Wait Time:** 10 milliseconds

| Parameter           | Description                                           |
|---------------------|-------------------------------------------------------|
| <i>copy latch #</i> | The number of flashback copy latch RVWR is waiting on |

## C.3.156 sbtbufinfo

This function is called when Oracle needs to discover the size, and number, of I/O buffers that have been allocated by the SBT layer. It should be very fast and never block.

**Wait Time:** Less than one millisecond

**Parameters:** None

## C.3.157 sbtgetbuf

This function obtains one I/O buffer that Oracle will use for I/O during a backup job.

**Wait Time:** Less than one millisecond

**Parameters:** None

## C.3.158 sbtmapbuf

This is an internal function used to facilitate multi-process buffer management. It should be very fast and never block.

**Wait Time:** Less than one millisecond

**Parameters:** None

## C.3.159 sbtrelbuf

This function releases an I/O buffer that has been already processed during a restore job, so that the SBT layer can fill it with more data. It should be very fast and never block.

**Wait Time:** Less than one millisecond

**Parameters:** None

### C.3.160 scginq AST call

Called by the session to find the highest lock mode that is held on a resource.

**Wait Time:** Wait up to 0.2 seconds, but the wait will continue until the NULL mode Acquisition AST has fired.

**Parameters:** None

### C.3.161 SGA: allocation forcing component growth

Process waiting on an immediate mode memory transfer with auto-tune SGA after a 4031 for MMAN to get the memory and post it.

**Wait Time:** 10 msec

**Parameters:** None

### C.3.162 SGA: MMAN sleep for component shrink

MMAN to wait and post itself for satisfying an auto-tuned memory request while trying to fully free a component's quiesced granules. In Release 10.1, the name of this event was 'wait for SGA component shrink'.

**Wait Time:** 10 msec

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| <i>P1</i> | component_id (corresponding to the memory pool) |
| <i>P2</i> | Current size in granules                        |
| <i>P3</i> | Target size in granules                         |

### C.3.163 SGA: sga\_target resize

Memory resize requests wait while sga target is being resized. In Release 10.1, the name of this event was 'wait for sga\_target resize'.

**Wait Time:** 10 msec

**Parameters:** None

### C.3.164 Shared IO Pool Memory

Wait until a shared I/O pool buffer becomes available. This happens when processes are using these buffers for I/O and the current process needs to wait for the release of any one of the buffers to the shared I/O pool.

**Wait Time:** 10msec

**Parameters:** None

## C.3.165 shared server idle wait

Idle wait event for a shared server.

The server waits on the common queue for a virtual circuit. (See also "[virtual circuit wait](#)".)

**Wait Time:** 30 seconds

**Parameters:** None

### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

## C.3.166 single-task message

When running single task, this event indicates that the session waits for the client side of the executable.

**Wait Time:** Total elapsed time that this session spent in the user application

**Parameters:** None

## C.3.167 smon timer

This is the main idle event for SMON. SMON will be waiting on this event most of the time until it times out or is posted by another process.

**Wait Time:** 5 minutes (300 seconds)

| Parameter        | Description                                                         |
|------------------|---------------------------------------------------------------------|
| <i>sleeptime</i> | The amount of time that SMON tries to wait on this event in seconds |
| <i>failed</i>    | The number of times SMON was posted when there some kind of error   |

### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

## C.3.168 SQL\*Net break/reset to client

The server sends a break or reset message to the client. The session running on the server waits for a reply from the client.

**Wait Time:** The actual time it takes for the break or reset message to return from the client

| Parameter        | Description                       |
|------------------|-----------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> " |
| <i>break?</i>    | See " <a href="#">break?</a> "    |

### C.3.169 SQL\*Net break/reset to dblink

Same as **SQL\*Net break/reset to client**, but in this case, the break/reset message is sent to another server process over a database link.

**Wait Time:** The actual time it takes for the break or reset message to return from the other server process

| Parameter        | Description                       |
|------------------|-----------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> " |
| <i>break?</i>    | See " <a href="#">break?</a> "    |

### C.3.170 SQL\*Net message from client

The server process (foreground process) waits for a message from the client process to arrive.

**Wait Time:** The time it took for a message to arrive from the client since the last message was sent to the client

| Parameter        | Description                                                                      |
|------------------|----------------------------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                                                |
| <i>#bytes</i>    | The number of bytes received by the server (foreground process) from the client. |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.171 SQL\*Net message from dblink

The session waits while the server process (foreground process) receives messages over a database link from another server process.

**Wait Time:** The time it took for a message to arrive from another server (foreground process) since a message was sent to the other foreground process.

| Parameter        | Description                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                                                                                     |
| <i>#bytes</i>    | The number of bytes received by the server (foreground process) from another foreground process over a database link. |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

## C.3.172 SQL\*Net message to client

The server (foreground process) is sending a message to the client.

**Wait Time:** The actual time the **send** takes

| Parameter        | Description                                                  |
|------------------|--------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                            |
| <i>#bytes</i>    | The number of bytes sent by the server process to the client |

## C.3.173 SQL\*Net message to dblink

The server process (foreground process) is sending a message over a database link to another server process.

**Wait Time:** The actual time the **send** takes

| Parameter        | Description                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                                                             |
| <i>#bytes</i>    | The number of bytes sent by the server process to another server process over a database link |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

## C.3.174 SQL\*Net more data from client

The server is waiting on the client to send more data to its client shadow process, in an already initiated operation.

**Wait Time:** The time waited depends on the time it took to receive the data (including the waiting time)

| Parameter        | Description                                  |
|------------------|----------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "            |
| <i>#bytes</i>    | The number of bytes received from the client |

### C.3.175 SQL\*Net more data from dblink

The foreground process is expecting more data from a data base link.

**Wait Time:** The total time it takes to read the data from the database link (including the waiting time for the data to arrive)

| Parameter        | Description                       |
|------------------|-----------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> " |
| <i>#bytes</i>    | The number of bytes received      |

### C.3.176 SQL\*Net more data to client

The server process is sending more data/messages to the client. The previous operation to the client was also a **send**.

**Wait Time:** The actual time it took for the **send** to complete

| Parameter        | Description                                           |
|------------------|-------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                     |
| <i>#bytes</i>    | The number of bytes that are being sent to the client |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.177 SQL\*Net more data to dblink

The event indicates that the server is sending data over a database link again. The previous operation over this database link was also a **send**.

**Wait Time:** The actual time it takes to send the data to the other server

| Parameter        | Description                                                                          |
|------------------|--------------------------------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                                                    |
| <i>#bytes</i>    | The number of bytes that are sent over the database link to the other server process |

### C.3.178 Streams AQ: waiting for messages in the queue

The session is waiting on an empty OLTP queue (Advanced Queuing) for a message to arrive so that the session can dequeue that message.

**Wait Time:** The amount of time that the session wants to wait is determined by the parameter *wait time*

| Parameter        | Description                                                  |
|------------------|--------------------------------------------------------------|
| <i>queue id</i>  | The ID of the OLTP queue for which this session is waiting   |
| <i>process#</i>  | The process number of the process in which this session runs |
| <i>wait time</i> | The intended wait time for this session                      |

### C.3.179 switch logfile command

The session waits on the user command `SWITCH LOGFILE` to complete.

**Wait Time:** 5 seconds

**Parameters:** None

### C.3.180 SYNC Remote Write

Used to track the time spent by LGWR doing SYNC RFSWRITE operations.

#### See Also:

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.181 TCP Socket (KGAS)

A session is waiting for an external host to provide requested data over a network socket. The time that this wait event tracks does not indicate a problem, and even a long wait time is not a reason to contact Oracle Support. It naturally takes time for data to flow between hosts over a network, and for the remote aspect of an application to process any request made to it.

An application that communicates with a remote host must wait until the data it will read has arrived. In addition, on Microsoft Windows, a separate thread monitors the arrival of traffic. This thread spends most of its life in waits tracked by the TCP Socket (KGAS) wait event.

**Wait Time:** The total elapsed time for the network connection to be established or for data to arrive from over the network

| Parameter | Description                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>P0</i> | For Oracle internal use only. Values 8, 9, and 10 occur within the special thread present on Microsoft Windows; other P0 values occur in normal user sessions. |
| <i>P1</i> | For Oracle internal use only                                                                                                                                   |

### C.3.182 timer in sksawt

The session waits for the Archiver (ARCn) asynchronous I/O to complete.

**Wait Time:** 0.01 seconds

**Parameters:** None

## C.3.183 transaction

Wait for a blocking transaction to be rolled back. Continue waiting until the transaction has been rolled back.

**Wait Time:** 1 second

| Parameter        | Description                                                         |
|------------------|---------------------------------------------------------------------|
| <i>undo seg#</i> | The rollback segment ID                                             |
| <i>slot#</i>     | The slot ID inside the rollback segment                             |
| <i>wrap#</i>     | The sequence number that is incremented for each transaction        |
| <i>count</i>     | The number of times that the session has waited on this transaction |

## C.3.184 unbound tx

The session waits to see if there are any transactions that have been started but do not have a Rollback Segment associated with them.

**Wait Time:** 1 second

**Parameters:** None

## C.3.185 undo\_retention publish retry

This wait can occur for two reasons. A session issuing an `ALTER SYSTEM SET UNDO_RETENTION` may wait on this event wait while a cluster reconfiguration takes place. Or the background process MMNL may wait for cluster reconfiguration while attempting to determine the max `UNDO_RETENTION`.

**Wait time:** 1 second

| Parameter | Description                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Identifies where the retry is happening. Id = 1 retry while publishing into the max undo_retention namespace. Id = 2 retry while iterator accessing the max undo_retention namespace. |
| <i>P2</i> | Retry count (maximum number of retries is 5)                                                                                                                                          |

## C.3.186 undo segment extension

The undo segment is being extended or shrunk. The session must wait until the operation on the undo segment has finished.

**Wait Time:** 0.01 seconds

| Parameter       | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| <i>segment#</i> | The ID of the rollback segment that is being extended or shrunk |

## C.3.187 undo segment recovery

PMON is rolling back a terminated transaction. The wait continues until rollback finishes.

**Wait Time:** 3 seconds

| Parameter       | Description                                                                            |
|-----------------|----------------------------------------------------------------------------------------|
| <i>segment#</i> | The ID of the rollback segment that contains the transaction that is being rolled back |
| <i>tx flags</i> | The transaction flags (options) set for the transaction that is being rolled back      |

## C.3.188 undo segment tx slot

Wait for a transaction slot to become available within the selected rollback segment. Continue waiting until the slot is available.

**Wait Time:** 1 second

| Parameter       | Description                                                                            |
|-----------------|----------------------------------------------------------------------------------------|
| <i>segment#</i> | The ID of the rollback segment that contains the transaction that is being rolled back |

## C.3.189 utl\_file I/O

Waits associated with operations performed using the `UTL_FILE` package.

## C.3.190 virtual circuit wait

The session waits for a virtual circuit operation to complete.

**Wait Time:** 30 seconds

| Parameter       | Description                                                |
|-----------------|------------------------------------------------------------|
| <i>circuit#</i> | Indicates the virtual circuit# being waited on             |
| <i>type</i>     | Indicates the type of operation the session is waiting for |

## C.3.191 WCR: replay client notify

During replay, the Workload Replay Client always keeps an open connection to the database to detect some special errors. This session will normally be in the wait state until some specific replay-related exception occurs.

**Wait Time:** Waits until notified. Times out every 30 seconds.

| Parameter       | Description                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>who am I</i> | Identifies the reason for wait for the admin thread.<br>1 - waiting for <code>REPLAY.START()</code> to be issued.<br>2 - waiting for the replay to run to completion or <code>REPLAY.CANCEL()</code> to be issued. |

## C.3.192 WCR: replay clock

A session will wait on this event during replay if it has some logical dependencies on another session that has not yet committed its work.

**Wait Time:** Depends upon the amount of row lock contention in the original capture

| Parameter                        | Description                                                          |
|----------------------------------|----------------------------------------------------------------------|
| <i>wait for scn's hi 4 bytes</i> | High 4 bytes of the 8-byte replay SCN that the session is waiting on |
| <i>wait for scn's lo 4 bytes</i> | Low 4 bytes of the 8-byte replay SCN that the session is waiting on  |

## C.3.193 WCR: replay lock order

A session will wait on this event during replay if it saw some lock contention during capture.

**Wait Time:** Depends upon the amount of row lock contention in the original capture

| Parameter                        | Description                                                          |
|----------------------------------|----------------------------------------------------------------------|
| <i>wait for scn's hi 4 bytes</i> | High 4 bytes of the 8-byte replay SCN that the session is waiting on |
| <i>wait for scn's lo 4 bytes</i> | Low 4 bytes of the 8-byte replay SCN that the session is waiting on  |

## C.3.194 WCR: replay paused

When the user issues a DBMS\_WORKLOAD\_REPLAY.PAUSE\_REPLAY command, all the replayed sessions are waiting on this wait event until replay is resumed.

**Parameters:** None

## C.3.195 WCR: Sync context busy

In the default replay mode, commits during replay are synchronized to follow the same order as capture. All commits are serialized using the Sync context. A replayed session will wait on this event if it is trying to commit at the same time as another replayed session.

**Parameters:** None

## C.3.196 write complete waits

The session waits for a buffer to be written. The write is caused by normal aging or by a cross-instance call.

**Wait Time:** 1 second

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <i>file#</i>  | The rollback segment id that contains the transaction that is being rolled back   |
| <i>block#</i> | The transaction flags (options) set for the transaction that is being rolled back |
| <i>id</i>     | Identifies the reason for waiting                                                 |

# D

## Oracle Enqueue Names

This appendix lists Oracle enqueues. **Enqueues** are shared memory structures (locks) that serialize access to database resources. They can be associated with a session or transaction. Enqueue names are displayed in the `LOCK_TYPE` column of the `DBA_LOCK` and `DBA_LOCK_INTERNAL` data dictionary views.

A **resource** uniquely identifies an object that can be locked by different sessions within an instance (local resource) or between instances (global resource). Each session that tries to lock the resource will have an **enqueue** on the resource.

### Note:

The names of enqueues and their definitions may change from release to release.

### See Also:

`"DBA_LOCK_INTERNAL"` and `"DBA_LOCK"`

The Oracle enqueues are:

- BL, Buffer Cache Management
- BR, Backup/Restore
- CF, Controlfile Transaction
- CI, Cross-instance Call Invocation
- CU, Bind Enqueue
- DF, Datafile
- DL, Direct Loader Index Creation
- DM, Database Mount
- DR, Distributed Recovery Process
- DW, SecureFiles
- DX, Distributed Transaction
- FP, File Object
- FS, File Set
- HW, High-Water Lock
- IN, Instance Number
- IR, Instance Recovery
- IS, Instance State

- IV, Library Cache Invalidation

# E

## Statistics Descriptions

This appendix describes the statistics stored in the `V$SESSTAT` and `V$SYSSTAT` dynamic performance tables. These statistics are useful in identifying and correcting performance problems.

This appendix contains the following topics:

- [Displaying Statistics](#)
- [Statistics Descriptions](#)

### E.1 Displaying Statistics

The `V$SESSTAT` view displays statistics on a per-session basis and is valid only for the session currently connected. When a session disconnects, all statistics for the session are updated in `V$SYSSTAT`. The values for the statistics are cleared until the next session uses them.

The `V$STATNAME` view contains all of the statistics for an Oracle release.

Many of these statistics are tied to the internal implementation of Oracle and therefore are subject to change or deletion without notice, even between patch releases. Application developers should be aware of this and write their code to tolerate missing or extra statistics.

#### See Also:

["V\\$SESSTAT"](#), ["V\\$STATNAME"](#), and ["V\\$SYSSTAT"](#) for more information on these views

### E.2 Statistics Descriptions

This section describes some of the statistics stored in the `V$SESSTAT` and `V$SYSSTAT` views.

The statistics are listed in alphabetical order.

The `CLASS` column contains a number representing one or more statistics classes. The following class numbers are additive:

- 1, User
- 2, Redo
- 4, Enqueue
- 8, Cache
- 16, OS
- 32, Real Application Clusters
- 64, SQL
- 128, Debug

- 256, Instance level

For example, a class value of 72 represents a statistic that relates to SQL statements and caching.

Some statistics are populated only if the `TIMED_STATISTICS` initialization parameter is set to `true`. Those statistics are flagged with a Y in the right-hand column.

**Table E-1 Database Statistics Descriptions**

| Name                                   | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | TIMED_STATISTICS |
|----------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| application wait time                  | 1     | The total wait time (in centiseconds) for waits that belong to the Application wait class                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |
| background checkpoints completed       | 8     | Number of checkpoints completed by the background process. This statistic is incremented when the background process successfully advances the thread checkpoint.                                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| background checkpoints started         | 8     | Number of checkpoints started by the background process. This statistic can be larger than "background checkpoints completed" if a new checkpoint overrides an incomplete checkpoint or if a checkpoint is currently under way. This statistic includes only checkpoints of the redo thread. It does not include: <ul style="list-style-type: none"> <li>• Individual file checkpoints for operations such as offline or begin backup</li> <li>• Foreground (user-requested) checkpoints (for example, performed by <code>ALTER SYSTEM CHECKPOINT LOCAL</code> statements)</li> </ul> |                  |
| background timeouts                    | 128   | This is a count of the times where a background process has set an alarm for itself and the alarm has timed out rather than the background process being posted by another process to do some work.                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| branch node splits                     | 128   | Number of times an index branch block was split because of the insertion of an additional value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                  |
| buffer is not pinned count             | 72    | Number of times a buffer was free when visited. Useful only for internal debugging purposes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| buffer is pinned count                 | 72    | Number of times a buffer was pinned when visited. Useful only for internal debugging purposes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                  |
| bytes received via SQL*Net from client | 1     | Total number of bytes received from the client over Oracle Net Services                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| bytes received via SQL*Net from dblink | 1     | Total number of bytes received from a database link over Oracle Net Services                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| bytes sent via SQL*Net to client       | 1     | Total number of bytes sent to the client from the foreground processes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |
| bytes sent via SQL*Net to dblink       | 1     | Total number of bytes sent over a database link                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                  |

|-------------------------------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| cell flash cache read hits for smart IO                     | 8     | Number of read requests for smart IO that were satisfied by the cache                                                                                                                                                                                                |                  |
| cell flash cache read hits for temp IO                      | 8     | Number of read requests for temp IO that were satisfied by the cache                                                                                                                                                                                                 |                  |
| cell IO uncompressed bytes                                  | 64    | Total size of uncompressed data that is processed on the cell<br>For operations on segments compressed using Exadata Hybrid Columnar Compression, this statistic is the size of the data after decompression.                                                        |                  |
| cell num bytes in passthru due to quarantine                | 8     | Number of bytes that were not offloaded and sent back to the database for processing due to a quarantine on the cell                                                                                                                                                 |                  |
| cell num bytes in passthru during predicate offload         | 64    | Number of bytes that were not offloaded and sent back to the database for processing                                                                                                                                                                                 |                  |
| cell overwrites in flash cache                              | 8     | Total number of write requests that overwrote an existing cacheline in Exadata Smart Flash Cache that had not been written to disk<br>In effect, this is the amount of disk I/O saved by using Write-Back mode. This statistic is incremented once per mirror write. |                  |
| cell partial writes in flash cache                          | 8     | Total number of write requests written to both Exadata Smart Flash Cache and disk<br>Part of the data was written to flash, and the rest was written to disk. This statistic is incremented once per mirror write.                                                   |                  |
| cell physical IO bytes added to storage index               | 8     | Number of bytes added to the storage index during a Smart Scan<br>This is an indication that the storage index is being built.                                                                                                                                       |                  |
| cell physical IO bytes eligible for predicate offload       | 64    | Number of bytes on-disk eligible for predicate offload                                                                                                                                                                                                               |                  |
| cell physical IO bytes eligible for smart IOs               | 8     | Number of actual bytes eligible for predicate offload<br>For example, when using columnar cache, this is the size of columnar cache instead of the on-disk size.                                                                                                     |                  |
| cell physical IO bytes processed for IM capacity            | 64    | Number of bytes read from the columnar cache in <code>memcompress for capacity</code> format                                                                                                                                                                         |                  |
| cell physical IO bytes processed for IM query               | 64    | Number of bytes read from the columnar cache in <code>memcompress for query</code> format                                                                                                                                                                            |                  |
| cell physical IO bytes processed for no memcompress         | 64    | Number of bytes read from the columnar cache in <code>no memcompress</code> format                                                                                                                                                                                   |                  |
| cell physical IO bytes saved by columnar cache              | 8     | Number of bytes saved by columnar cache, that is, the number of bytes of reading that were avoided                                                                                                                                                                   |                  |
| cell physical IO bytes saved by storage index               | 8     | Number of bytes saved by the storage index                                                                                                                                                                                                                           |                  |
| cell physical IO bytes saved during optimized file creation | 64    | Number of I/O bytes saved by the database host by offloading the file creation operation to the cells<br>This statistic shows the benefit of optimized file creation operations.                                                                                     |                  |

| consistent gets direct                      | 8     | Number of times a consistent read was requested for a block bypassing the buffer cache (for example, direct load operation). This is a subset of "consistent gets" statistics value.                                                                                                                                                                                                                                   |                  |
| consistent gets from cache                  | 8     | Number of times a consistent read was requested for a block from buffer cache. This is a subset of "consistent gets" statistics value.                                                                                                                                                                                                                                                                                 |                  |
| consistent gets from pmem                   | 8     | Number of direct-mapped blocks accessed in CR (consistent read) mode from PMEM. This is a subset of "consistent gets" statistics value.                                                                                                                                                                                                                                                                                |                  |
| consistent gets pmem direct                 | 8     | Number of CR gets from pmem in direct read (e.g. tablescan) code path. This is a subset of "consistent gets from pmem" statistics value.                                                                                                                                                                                                                                                                               |                  |
| consistent gets pmem examination            | 8     | Number of direct-mapped blocks accessed and examined in CR mode from PMEM, via regular path. This is a subset of "consistent gets from pmem" statistics value.                                                                                                                                                                                                                                                         |                  |
| consistent gets pmem examination (fastpath) | 8     | Number of direct-mapped blocks accessed and examined in CR mode from PMEM, via fast path. This is a subset of both "consistent gets from pmem" and "consistent gets pmem examination" statistics values.                                                                                                                                                                                                               |                  |
| consistent gets pmem pin                    | 8     | Number of direct-mapped blocks accessed and pinned in CR mode from PMEM, via regular path. This is a subset of "consistent gets from pmem" statistics value.                                                                                                                                                                                                                                                           |                  |
| consistent gets pmem pin (fastpath)         | 8     | Number of direct-mapped blocks accessed and pinned in CR mode from PMEM, via fast path. This is a subset of both "consistent gets from pmem" and "consistent gets pmem pin" statistics values.                                                                                                                                                                                                                         |                  |
| CPU used by this session                    | 1     | Amount of CPU time (in 10s of milliseconds) used by a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistics, and 0 milliseconds are added.<br><br>A similar problem can exist in the reporting by the operating system, especially on systems that suffer from many context switches. | Y                |
| CPU used when call started                  | 128   | The CPU time used when the call is started<br><br><b>See Also:</b> " <a href="#">CPU used by this session</a> "                                                                                                                                                                                                                                                                                                        | Y                |
| CR blocks created                           | 8     | Number of CURRENT blocks cloned to create CR (consistent read) blocks. The most common reason for cloning is that the buffer is held in a incompatible mode.                                                                                                                                                                                                                                                           |                  |
| cumulative begin requests                   | 32    | Total number of begin requests received by the Oracle database allowing the database to detect and process requests                                                                                                                                                                                                                                                                                                    |                  |
| cumulative DB time in requests              | 288   | Total database time DB Time (in microseconds) within requests to the Oracle database, measuring DB time used from the beginning to the end of each request. (See also DB time statistic.)                                                                                                                                                                                                                              |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                                      | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | TIMED_STATISTICS |
|-----------------------------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| cumulative DB time protected in requests                  | 288   | Total database time DB Time (in microseconds) within requests to the Oracle database protected by Application Continuity or Transparent Application Continuity, measuring DB time used from the beginning to the end of each request. (See also DB time statistic.)<br><br>This is a subset of "cumulative DB time in requests" value, which enables you to calculate the ratio of total time in requests to protected time in requests. See also Application Continuity Protection Check (ACCHK). |                  |
| cumulative end requests                                   | 32    | Total number of end requests received by the Oracle database allowing the database to detect and process requests                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| cumulative time in requests                               | 32    | Total wall clock time (in microseconds) within requests to the Oracle database, measuring time spent from the beginning to the end of each request. This statistic is used by draining and planned failover. (See <code>drain_timeout</code> .)                                                                                                                                                                                                                                                    |                  |
| cumulative user calls in requests                         | 32    | Total number of user calls received by the Oracle database within requests to the Oracle database                                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| cumulative user calls protected by Application Continuity | 32    | Total number of user calls received by the Oracle database within requests to the Oracle database that were protected by Application Continuity or Transparent Application Continuity                                                                                                                                                                                                                                                                                                              |                  |
| current blocks converted for CR                           | 8     | Number <code>CURRENT</code> blocks converted to CR state                                                                                                                                                                                                                                                                                                                                                                                                                                           |                  |
| cursor authentications                                    | 128   | Number of privilege checks conducted during execution of an operation                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| data blocks consistent reads - undo records applied       | 128   | Number of undo records applied to data blocks that have been rolled back for consistent read purposes                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| data warehousing cooling action                           | 8     | Number of times that cooling occurred on this instance                                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |
| data warehousing evicted objects                          | 8     | Number of times that objects got evicted by automatic big table caching on this instance                                                                                                                                                                                                                                                                                                                                                                                                           |                  |
| data warehousing evicted objects - cooling                | 8     | Number of times that objects got evicted on this instance due to a cooling action                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| data warehousing evicted objects - replace                | 8     | Number of times that objects got evicted due to caching replacement, that is, when an object is evicted because a hotter object forces it to be evicted from the cache                                                                                                                                                                                                                                                                                                                             |                  |
| data warehousing scanned blocks                           | 8     | Number of blocks scanned by automatic big table caching on this instance using parallel query                                                                                                                                                                                                                                                                                                                                                                                                      |                  |
| data warehousing scanned blocks - disk                    | 8     | Number of blocks scanned by automatic big table caching on this instance by direct read from disk                                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| data warehousing scanned blocks - memory                  | 8     | Number of blocks scanned by automatic big table caching on this instance by cache read from memory                                                                                                                                                                                                                                                                                                                                                                                                 |                  |
| data warehousing scanned blocks - offload                 | 8     | Number of blocks scanned by automatic big table caching on this instance by Exadata offloading                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| data warehousing scanned objects                          | 8     | Number of times the objects in automatic big table caching are scanned using parallel query                                                                                                                                                                                                                                                                                                                                                                                                        |                  |

| Name                                           | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | TIMED_STATISTICS |
|------------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| db block changes                               | 8     | <p>Closely related to "<a href="#">consistent changes</a>", this statistic counts the total number of changes that were part of an update or delete operation that were made to all blocks in the SGA. Such changes generate redo log entries and hence become permanent changes to the database if the transaction is committed.</p> <p>This approximates total database work. This statistic indicates the rate at which buffers are being dirtied (on a per-transaction or per-second basis, for example).</p> |                  |
| db block gets                                  | 8     | <p>Number of times a <code>CURRENT</code> block was requested</p> <p><b>See Also:</b> "<a href="#">consistent gets</a>"</p>                                                                                                                                                                                                                                                                                                                                                                                       |                  |
| db block gets direct                           | 8     | Number of times a <code>CURRENT</code> block was requested bypassing the buffer cache (for example, a direct load operation). This is a subset of "db block gets" statistics value.                                                                                                                                                                                                                                                                                                                               |                  |
| db block gets from cache                       | 8     | Number of times a <code>CURRENT</code> block was requested from the buffer cache. This is a subset of "db block gets" statistics value.                                                                                                                                                                                                                                                                                                                                                                           |                  |
| db block gets from pmem                        | 8     | Number of direct-mapped blocks accessed in <code>CURRENT</code> mode from PMEM, via regular path                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| db block gets from pmem (fastpath)             | 8     | Number of direct-mapped blocks accessed in <code>CURRENT</code> mode from PMEM, via fast path                                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| DBWR checkpoint buffers written                | 8     | Number of buffers that were written for checkpoints                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| DBWR checkpoints                               | 8     | Number of times the DBWR was asked to scan the cache and write all blocks marked for a checkpoint or the end of recovery. This statistic is always larger than " <a href="#">background checkpoints completed</a> ".                                                                                                                                                                                                                                                                                              |                  |
| DBWR lru scans                                 | 8     | Number of times that DBWR scans the LRU queue looking for buffers to write. This count includes scans to fill a batch being written for another purpose (such as a checkpoint).                                                                                                                                                                                                                                                                                                                                   |                  |
| DBWR revisited being-written buffer            | 8     | <p>Number of times that DBWR tried to save a buffer for writing and found that it was already in the write batch. This statistic measures the amount of "useless" work that DBWR had to do in trying to fill the batch.</p> <p>Many sources contribute to a write batch. If the same buffer from different sources is considered for adding to the write batch, then all but the first attempt will be "useless" because the buffer is already marked as being written.</p>                                       |                  |
| DBWR transaction table writes                  | 8     | Number of rollback segment headers written by DBWR. This statistic indicates how many "hot" buffers were written, causing a user process to wait while the write completed.                                                                                                                                                                                                                                                                                                                                       |                  |
| DBWR undo block writes                         | 8     | Number of rollback segment blocks written by DBWR                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                  |
| DDL statements parallelized                    | 32    | Number of DDL statements that were executed in parallel                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                  |
| deferred (CURRENT) block cleanout applications | 128   | Number of times cleanout records are deferred, piggyback with changes, always current get                                                                                                                                                                                                                                                                                                                                                                                                                         |                  |
| DFO trees parallelized                         | 32    | Number of times a serial execution plan was converted to a parallel plan                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | TIMED_STATISTICS |
|-------------------------------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| dirty buffers inspected             | 8     | Number of dirty buffers found by the user process while it is looking for a buffer to reuse                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| DML statements parallelized         | 32    | Number of DML statements that were executed in parallel                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                  |
| DML statements retried              | 64    | <p>When a long-running DML is executing, the cursor may get invalidated due to some concurrent DDL on one of the cursor's dependencies. In this case, an internal ORA-14403 error is thrown and is caught and cleared in one of the calling functions. The current work is rolled back and the DML is restarted without the user being notified of this.</p> <p>The statistic counts the number of times that the thrown, caught, and cleared (ORA-14403) sequence occurred for DML statements. Should a DML vary widely in execution time, check this statistic to see if it increments during the DML execution. If so, then concurrent DDL may be the cause of the extra elapsed time.</p> |                  |

| file io wait time                   | 1     | Total time spent in wait (in microseconds) for I/O to datafiles, excluding the service time for such I/O. This is cumulative for all I/Os for all datafiles. The service time for one I/O operation is estimated as the minimum time spent in the I/O call seen so far. This service time is subtracted from the time spent in each I/O call to get the wait time for that I/O.                                                                                                                                                                                                                                                                                                               |                  |

| Name                                       | Class | Description                                                                                                                                                                                                                                                                                                                                           | TIMED_STATISTICS |
|--------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| flash cache insert skip: DBWR overloaded   | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because DBWR was busy writing other buffers                                                                                                                                                                                                                            |                  |
| flash cache insert skip: exists            | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was already in the flash cache                                                                                                                                                                                                                              |                  |
| flash cache insert skip: modification      | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was being modified                                                                                                                                                                                                                                          |                  |
| flash cache insert skip: not current       | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was not current                                                                                                                                                                                                                                             |                  |
| flash cache insert skip: not useful        | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because the type of buffer was not useful to keep                                                                                                                                                                                                                      |                  |
| flash cache inserts                        | 8     | Total number of in-memory buffers inserted into the Database Smart Flash Cache                                                                                                                                                                                                                                                                        |                  |
| flashback log write bytes                  | 2     | Total size in bytes of flashback database data written by RVWR to flashback database logs                                                                                                                                                                                                                                                             |                  |
| flashback log writes                       | 2     | Total number of writes by RVWR to flashback database logs                                                                                                                                                                                                                                                                                             |                  |
| foreground propagated tracked transactions | 128   | Number of transactions modifying tables enabled for flashback data archive which were archived by a foreground process                                                                                                                                                                                                                                |                  |
| free buffer inspected                      | 8     | Number of buffers skipped over from the end of an LRU queue to find a reusable buffer. The difference between this statistic and "dirty buffers inspected" is the number of buffers that could not be used because they had a user, a waiter, or were being read or written, or because they were busy or needed to be written after rapid aging out. |                  |
| free buffer inspected for pmem             | 8     | Number of PMEM buffers skipped over from the end of an LRU queue to find a reusable PMEM buffer                                                                                                                                                                                                                                                       |                  |
| free buffer requested                      | 8     | Number of times a reusable buffer or a free buffer was requested to create or load a block                                                                                                                                                                                                                                                            |                  |
| free buffer requested for pmem             | 8     | Number of times a reusable PMEM buffer or a free PMEM buffer was requested to directly access a block                                                                                                                                                                                                                                                 |                  |
| gc read wait failures                      | 40    | A read wait is when a CR server waits for a disk read to complete before serving a block to another instance. This statistic displays the number of times a read wait ended in failure, that is, after waiting it was unable to serve a block.                                                                                                        |                  |
| gc read wait timeouts                      | 40    | A read wait is when a CR server waits for a disk read to complete before serving a block to another instance. This statistic displays the number of times a read wait timed out, that is, the disk read did not complete in time, so the wait was terminated.                                                                                         |                  |
| gc read waits                              | 40    | The number of times a CR server waited for a disk read, and then successfully served a block                                                                                                                                                                                                                                                          |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                     | Class | Description                                                                                                                                                                                                                                                                                                                         | TIMED_STATISTICS |
|------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| global enqueue CPU used by this session  | 32    | Amount of CPU time (in 10s of milliseconds) used by synchronous and asynchronous global enqueue activity in a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistics, and 0 milliseconds are added. |                  |
| global enqueue get time                  | 32    | Total elapsed time in 10s of milliseconds of all synchronous and asynchronous global enqueue gets and converts                                                                                                                                                                                                                      |                  |
| global enqueue gets async                | 32    | Total number of asynchronous global enqueue gets and converts                                                                                                                                                                                                                                                                       |                  |
| global enqueue gets sync                 | 32    | Total number of synchronous global enqueue gets and converts                                                                                                                                                                                                                                                                        |                  |
| global enqueue releases                  | 32    | Total number of synchronous global enqueue releases                                                                                                                                                                                                                                                                                 |                  |

| HCC scan cell CUs query low                 | 128   | Number of Compression Units scanned that had been compressed with <code>QUERY LOW</code>                                                            |                  |
| HCC scan cell CUs sent compressed           | 64    | Number of Compression Units that the storage server returned to the RDBMS still compressed after predicate evaluation was done                      |                  |
| HCC scan cell CUs sent head piece           | 64    | Number of Compression Units that the storage server was unable to process and the block header was returned to the RDBMS to be processed            |                  |
| HCC scan cell CUs sent uncompressed         | 64    | Number of Compression Units that the storage server returned to the RDBMS in uncompressed columnar format                                           |                  |
| HCC scan cell rows                          | 128   | Number of rows from columnar formatted data that were returned by the storage server to the RDBMS                                                   |                  |
| HCC scan CUs pcode aggregation pushdown     | 128   | Number of Compression Units that were aggregated on the cell using P(ortable)-byte code                                                             |                  |
| HCC scan CUs pcode pred evald               | 128   | Number of predicates that were evaluated using P(ortable)-byte code                                                                                 |                  |
| HCC scan CUs pcode pred evald using rowsets | 128   | Number of predicates that were evaluated using P(ortable)-byte code using vectorized data                                                           |                  |
| HCC scan CUs predicates applied             | 128   | Number of predicates where at least some value passed the Min/Max check                                                                             |                  |
| HCC scan CUs predicates optimized           | 128   | Number of predicates that could be evaluated directly against columnar data                                                                         |                  |
| HCC scan CUs predicates received            | 128   | Number of predicates sent to the storage server that could be evaluated directly against HCC format data after decompression                        |                  |
| HCC scan rdbms bytes compressed             | 128   | Length of the compressed data stored in Compression Units prior to decompression. This is the length of all columns, not just the columns accessed. |                  |
| HCC scan rdbms bytes decompressed           | 128   | Length of the data after decompression stored in Compression Units. This is the length of all columns, not just the columns accessed.               |                  |
| HCC scan rdbms CUs archive high             | 128   | Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with <code>ARCHIVE HIGH</code>                        |                  |
| HCC scan rdbms CUs archive low              | 128   | Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with <code>ARCHIVE LOW</code>                         |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                       | Class | Description                                                                                                                                                                                                                                                   | TIMED_STATISTICS |
|--------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| HCC scan rdbms CUs columns accessed        | 128   | Number of columns that were decompressed                                                                                                                                                                                                                      |                  |
| HCC scan rdbms CUs decompressed            | 128   | Number of Compression Units that were decompressed on the RDBMS server                                                                                                                                                                                        |                  |
| HCC scan rdbms CUs decompression time      | 128   | Total time spent decompressing the columns that were needed on the RDBMS server                                                                                                                                                                               |                  |
| HCC scan rdbms CUs normal                  | 128   | Number of HCC Compression Units decompressed by the RDBMS regular table scan, i.e., 'Table Access Full' in a query plan. This is typically used in specialized scans that, for example, use row versions, row SCN, or use the <code>LONG RAW</code> datatype. |                  |
| HCC scan rdbms CUs pruned                  | 128   | Number of Compression Units that were eliminated by comparing the predicates to the stored Min and Max values for that Compression Unit                                                                                                                       |                  |
| HCC scan rdbms CUs query high              | 128   | Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with <code>QUERY HIGH</code> (which is the default)                                                                                                             |                  |
| HCC scan rdbms CUs query low               | 128   | Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with <code>QUERY LOW</code>                                                                                                                                     |                  |
| HCC scan rdbms CUs turbo                   | 128   | Number of HCC Compression Units decompressed by the RDBMS fast table scan (TurboScan). This is separate to decompression that happens on an Exadata cell.                                                                                                     |                  |
| HCC scan rdbms rows                        | 128   | Number of rows returned from HCC blocks or that were returned from an Exadata cell in columnar format that passed the predicates on that table                                                                                                                |                  |
| HCC scan rows pcode aggregated             | 128   | Number of rows from HCC blocks or from columnar format blocks returned by an Exadata cell that could be aggregated using the P(ortable)-code style of query compilation                                                                                       |                  |
| HCC usage cloud                            | 128   | Internal count of how often TurboScan is invoked for HCC data stored in an Oracle Cloud environment. It does not include Oracle on other vendor's clouds. This may or may not correspond with the number of queries or granules scanned.                      |                  |
| HCC usage pillar                           | 128   | Internal count of how often TurboScan is invoked for HCC data stored on Pillar storage. This may or may not correspond with the number of queries or granules scanned.                                                                                        |                  |
| HCC usage ZFS                              | 128   | Internal count of how often TurboScan is invoked for HCC data stored on ZFS storage. This may or may not correspond with the number of queries or granules scanned.                                                                                           |                  |
| hot buffers moved to head of LRU           | 8     | When a hot buffer reaches the tail of its replacement list, Oracle moves it back to the head of the list to keep it from being reused. This statistic counts such moves.                                                                                      |                  |
| hot buffers moved to head of LRU for pmem  | 8     | When a hot PMEM buffer reaches the tail of its replacement list, Oracle moves it back to the head of the list to keep it from being reused. This statistic counts such moves.                                                                                 |                  |
| hot pmem block exchange with dram attempts | 264   | Number of hot PMEM buffers that were attempted to be exchanged with colder DRAM buffers, to ensure both blocks are still cached                                                                                                                               |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                            | Class | Description                                                                                                                                                                  | TIMED_STATISTICS |
|-------------------------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| hot pmem block exchange with dram successes     | 264   | Number of hot PMEM buffers that were successfully exchanged with colder DRAM buffers, with both blocks still cached                                                          |                  |
| hot pmem block migration to dram attempts       | 8     | Number of hot PMEM buffer cache blocks that were attempted to be migrated to DREM to reduce access latency                                                                   |                  |
| hot pmem block migration to dram successes      | 264   | Number of hot PMEM buffer cache blocks that were successfully migrated to DRAM to reduce access latency                                                                      |                  |
| immediate (CR) block cleanout applications      | 128   | Number of times cleanout records are applied immediately during consistent-read requests                                                                                     |                  |
| immediate (CURRENT) block cleanout applications | 128   | Number of times cleanout records are applied immediately during current gets. Compare this statistic with " <a href="#">deferred (CURRENT) block cleanout applications</a> " |                  |
| IM (HPK4SQL) hash joins attempted               | 384   | Number of in-memory vectorized hash joins attempted                                                                                                                          |                  |
| IM (HPK4SQL) hash joins completed               | 384   | Number of in-memory vectorized hash joins completed                                                                                                                          |                  |
| IM (hybrid) scan blocks on hybrid list          | 384   | Number of blocks on the hybrid In-Memory scan list                                                                                                                           |                  |
| IM (hybrid) scan rows on hybrid list            | 384   | Number of rows on the hybrid In-Memory scan list                                                                                                                             |                  |
| IM default area resized                         | 128   | The amount of memory by which the column store got resized                                                                                                                   |                  |
| IM populate accumulated time (ms)               | 128   | Total amount of DB time (in milliseconds) spent populating CUs into the IM column store due to segment scans                                                                 |                  |
| IM populate bytes in-memory EU data             | 128   | Size in bytes of in-memory EU data populated due to segment scans                                                                                                            |                  |
| IM populate bytes uncompressed EU data          | 128   | Uncompressed size in bytes of in-memory EU data populated due to segment scans                                                                                               |                  |
| IM populate CUs                                 | 128   | Number of CUs populated in the IM column store due to segment scans                                                                                                          |                  |
| IM populate CUs memcompress for capacity high   | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for capacity high                                                                      |                  |
| IM populate CUs memcompress for capacity low    | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for capacity low                                                                       |                  |
| IM populate CUs memcompress for dml             | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for DML                                                                                |                  |
| IM populate CUs memcompress for query high      | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for query high                                                                         |                  |
| IM populate CUs memcompress for query low       | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for query low                                                                          |                  |
| IM populate CUs no memcompress                  | 128   | Number of CUs populated in the IM column store due to segment scans without compression                                                                                      |                  |
| IM populate CUs requested                       | 128   | Number of CUs requested to be populated due to segment scans                                                                                                                 |                  |
| IM populate EUs                                 | 128   | Number of EUs populated in the IM column store due to segment scans                                                                                                          |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                             | Class | Description                                                                                                          | TIMED_STATISTICS |
|--------------------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------|------------------|
| IM populate EUs accumulated time (ms)            | 128   | Total amount of DB time (in milliseconds) spent populating EUs into the IM column store due to segment scans         |                  |
| IM populate EUs columns                          | 128   | Number of columns populated in EUs due to segment scans                                                              |                  |
| IM populate EUs memcompress for capacity high    | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for capacity high                 |                  |
| IM populate EUs memcompress for capacity low     | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for capacity low                  |                  |
| IM populate EUs memcompress for dml              | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for dml                           |                  |
| IM populate EUs memcompress for query high       | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for query high                    |                  |
| IM populate EUs memcompress for query low        | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for query low                     |                  |
| IM populate EUs no memcompress                   | 128   | Number of EUs populated in the IM column store without compression due to segment scans                              |                  |
| IM populate EUs requested                        | 128   | Number of EUs requested to be populated in the IM column store due to segment scans                                  |                  |
| IM populate no contiguous inmemory space         | 128   | Number of CUs that fail to populate due to lack of contiguous space in the In-Memory Area                            |                  |
| IM populate segments                             | 128   | Number of segments populated due to segment scan                                                                     |                  |
| IM populate segments requested                   | 128   | Number of segments requested to be populated due to segment scan                                                     |                  |
| IM populate segments wall clock time (ms)        | 128   | Total amount of wall clock time (in milliseconds) spent populating CUs into the IM column store due to segment scans |                  |
| IM prepopulate accumulated time (ms)             | 128   | Total amount of DB time (in milliseconds) spent prepopulating CUs into the IM column store priority                  |                  |
| IM prepopulate bytes in-memory EU data           | 128   | Size in bytes of in-memory EU data populated due to priority                                                         |                  |
| IM prepopulate bytes uncompressed EU data        | 128   | Uncompressed size in bytes of in-memory EU data populated due to priority                                            |                  |
| IM prepopulate CUs                               | 128   | Number of CUs prepopulated in the IM column store due to priority                                                    |                  |
| IM prepopulate CUs memcompress for capacity high | 128   | Number of CUs prepopulated in the IM column store due to priority using memcompress for capacity high                |                  |
| IM prepopulate CUs memcompress for capacity low  | 128   | Number of CUs prepopulated in the IM column store due to priority using memcompress for capacity low                 |                  |
| IM prepopulate CUs memcompress for dml           | 128   | Number of CUs prepopulated in the IM column store due to priority using memcompress for DML                          |                  |
| IM prepopulate CUs memcompress for query high    | 128   | Number of CUs prepopulated in the IM column store due to priority using memcompress for query high                   |                  |
| IM prepopulate CUs memcompress for query low     | 128   | Number of CUs prepopulated in the IM column store due to priority using memcompress for query low                    |                  |
| IM prepopulate CUs no memcompress                | 128   | Number of CUs prepopulated in the IM column store due to priority without compression                                |                  |

| IM repopulate (scan) EUs                                  | 128   | Number of EUs repopulated in the IM column store that were triggered by scans on the EU                              |                  |
| IM repopulate (scan) EUs requested                        | 128   | Number of EUs requested for repopulation in the IM column store that were triggered by scans on the EU               |                  |
| IM repopulate segments                                    | 128   | Number of segments repopulated                                                                                       |                  |
| IM repopulate segments requested                          | 128   | Indicates the number of segments requested to be repopulated                                                         |                  |
| IM repopulate (trickle) accumulated time (ms)             | 128   | Total amount of DB time (in milliseconds) spent trickle repopulating CUs into the IM column store due to DML changes |                  |
| IM repopulate (trickle) bytes in-memory EU data           | 128   | Size in bytes of in-memory EU data repopulated due to DML changes                                                    |                  |
| IM repopulate (trickle) bytes uncompressed EU data        | 128   | Uncompressed size in bytes of in-memory EU data repopulated due to EU reaching staleness threshold                   |                  |
| IM repopulate (trickle) CUs                               | 128   | Number of CUs trickle repopulated in the IM column store due to DML changes                                          |                  |
| IM repopulate (trickle) CUs memcompress for capacity high | 128   | Number of CUs trickle repopulated in the IM column store using memcompress for capacity high due to DML changes      |                  |
| IM repopulate (trickle) CUs memcompress for capacity low  | 128   | Number of CUs trickle repopulated in the IM column store using memcompress for capacity low due to DML changes       |                  |
| IM repopulate (trickle) CUs memcompress for dml           | 128   | Number of CUs trickle repopulated in the IM column store using memcompress for DML due to DML changes                |                  |
| IM repopulate (trickle) CUs memcompress for query high    | 128   | Number of CUs trickle repopulated in the IM column store using memcompress for query high due to DML changes         |                  |
| IM repopulate (trickle) CUs memcompress for query low     | 128   | Number of CUs trickle repopulated in the IM column store using memcompress for query low due to DML changes          |                  |
| IM repopulate (trickle) CUs no memcompress                | 128   | Number of CUs trickle repopulated in the IM column store without compression due to DML changes                      |                  |
| IM repopulate (trickle) CUs requested                     | 128   | Total number of CUs requested to be trickle repopulated due to DML changes                                           |                  |
| IM repopulate (trickle) CUs resubmitted                   | 128   | Number of CUs trickle repopulate tasks submitted                                                                     |                  |
| IM repopulate (trickle) EUs                               | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes                                          |                  |
| IM repopulate (trickle) EUs accumulated time (ms)         | 128   | Total amount of DB time (in milliseconds) spent trickle repopulating EUs into the IM column store due to DML changes |                  |
| IM repopulate (trickle) EUs columns                       | 128   | Number of columns repopulated in EUs due to DML changes                                                              |                  |
| IM repopulate (trickle) EUs memcompress for capacity high | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for capacity high         |                  |
| IM repopulate (trickle) EUs memcompress for capacity low  | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for capacity low          |                  |
| IM repopulate (trickle) EUs memcompress for dml           | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for dml                   |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                                    | Class | Description                                                                                                                                                                    | TIMED_STATISTICS |
|---------------------------------------------------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| IM repopulate (trickle) EUs memcompress for query high  | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for query high                                                                      |                  |
| IM repopulate (trickle) EUs memcompress for query low   | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for query low                                                                       |                  |
| IM repopulate (trickle) EUs no memcompress              | 128   | Number of EUs trickle repopulated in the IM column store without compression due to DML changes                                                                                |                  |
| IM repopulate (trickle) EUs requested                   | 128   | Number of EUs requested to be trickle repopulated in the IM column store due to DML changes                                                                                    |                  |
| IM scan CUs column not in memory                        | 128   | Number of extents that could not be read from the IM column store because one of the columns required was not in memory                                                        |                  |
| IM scan CUs invalid or missing revert to on disk extent | 128   | Number of extents where no IMCU exists                                                                                                                                         |                  |
| IM scan CUs memcompress for query low                   | 128   | Number of memcompress for query high CUs scanned in the IM column store                                                                                                        |                  |
| IM scan CUs memcompress for query high                  | 128   | Number of memcompress for query high CUs scanned in the IM column store                                                                                                        |                  |
| IM scan CUs memcompress for capacity low                | 128   | Number of memcompress for capacity low CUs scanned in the IM column store                                                                                                      |                  |
| IM scan CUs memcompress for capacity high               | 128   | Number of memcompress for capacity high CUs scanned in the IM column store                                                                                                     |                  |
| IM scan CUs memcompress for dml                         | 128   | Number of memcompress for DML CUs scanned in the IM column store                                                                                                               |                  |
| IM scan CUs predicates applied                          | 128   | Number of where clause predicates applied to the In-Memory storage index                                                                                                       |                  |
| IM scan CUs predicates optimized                        | 128   | Number of where clause predicates applied to the IM column store for which either all rows pass min/max pruning via an In-Memory storage index or no rows pass min/max pruning |                  |
| IM scan CUs pruned                                      | 128   | Number of CUs pruned by the storage index                                                                                                                                      |                  |
| IM scan (dynamic) multi-threaded scans                  | 128   | Number of In-Memory table scans which benefited from In-Memory dynamic scans                                                                                                   |                  |
| IM scan (dynamic) tasks processed by parent             | 128   | Number of IMCUs processed normally because of Resource Manager limit                                                                                                           |                  |
| IM scan (dynamic) tasks processed by thread             | 128   | Number of IMCUs processed in parallel by a worker thread                                                                                                                       |                  |
| IM scan (dynamic) rows                                  | 128   | Number of rows processed by In-Memory dynamic scans                                                                                                                            |                  |
| IM scan EU bytes in-memory                              | 128   | Size in bytes of in-memory EU data accessed by scans                                                                                                                           |                  |
| IM scan EU bytes uncompressed                           | 128   | Uncompressed size in bytes of in-memory EU data accessed by scans                                                                                                              |                  |
| IM scan EU rows                                         | 128   | Number of rows scanned from EUs in the IM column store before where clause predicate applied                                                                                   |                  |
| IM scan EUs columns accessed                            | 128   | Number of columns in the EUs accessed by scans                                                                                                                                 |                  |
| IM scan EUs columns decompressed                        | 128   | Number of columns in the EUs decompressed by scans                                                                                                                             |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                      | Class | Description                                                                                                                                                         | TIMED_STATISTICS |
|-------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| IM scan EUs columns theoretical max       | 128   | Number of columns that would have been accessed from the EU if the scans looked at all columns                                                                      |                  |
| IM scan EUs memcompress for capacity high | 128   | Number of memcompress for capacity high EUs scanned in the IM column store                                                                                          |                  |
| IM scan EUs memcompress for capacity low  | 128   | Number of memcompress for capacity low EUs scanned in the IM column store                                                                                           |                  |
| IM scan EUs memcompress for dml           | 128   | Number of memcompress for DML EUs scanned in the IM column store                                                                                                    |                  |
| IM scan EUs memcompress for query high    | 128   | Number of memcompress for query high EUs scanned in the IM column store                                                                                             |                  |
| IM scan EUs memcompress for query low     | 128   | Number of memcompress for query low EUs scanned in the IM column store                                                                                              |                  |
| IM scan EUs no memcompress                | 128   | Number of uncompressed EUs scanned in the IM column store                                                                                                           |                  |
| IM scan EUs split pieces                  | 128   | Number of split EU pieces among all IM EUs                                                                                                                          |                  |
| IM scan rows                              | 128   | Number of rows in scanned In-Memory Compression Units (IMCUs)                                                                                                       |                  |
| IM scan rows optimized                    | 128   | Number of rows that were not scanned in the IM column store as they were pruned via a number of optimizations such as min/max pruning via In-Memory storage indexes |                  |
| IM scan rows projected                    | 128   | Number of rows returned from the IM column store                                                                                                                    |                  |
| IM scan rows valid                        | 128   | Number of rows scanned from the IM column store after applying valid vector                                                                                         |                  |
| IM scan segments minmax eligible          | 128   | Number of CUs that are eligible for min/max pruning via storage index                                                                                               |                  |
| IM space CU bytes allocated               | 128   | Number of In-Memory bytes allocated                                                                                                                                 |                  |
| IM space CU creations initiated           | 128   | Number of space requests for CUs                                                                                                                                    |                  |
| IM space CU extents allocated             | 128   | Number of In-Memory extents allocated                                                                                                                               |                  |
| IM space segments allocated               | 128   | Number of snapshot segments created                                                                                                                                 |                  |
| IM space segments freed                   | 128   | Number of snapshot segments deleted                                                                                                                                 |                  |
| IM transactions                           | 128   | Number of transactions that triggered data to be journaled in the IM column store                                                                                   |                  |
| IM transactions CUs invalid               | 128   | Number of CUs in the IM column store invalidated by transactions                                                                                                    |                  |
| IM transactions rows invalidated          | 128   | Number of rows in the IM column store invalidated by transactions                                                                                                   |                  |
| IM transactions rows journaled            | 128   | Number of rows logged in the transaction journal                                                                                                                    |                  |
| in call idle wait time                    | 1     | The total wait time (in microseconds) for waits that belong to the Idle wait class.<br><b>See Also:</b> "non-idle wait count" and "non-idle wait time"              |                  |
| index cmph cu, uncomp sentinels           | 128   | Number of CUs created with uncompressed sentinels                                                                                                                   |                  |
| index cmph dm, cu lock expand             | 128   | Number of times CU lock structure expanded                                                                                                                          |                  |
| index cmph dm, cu migrate row             | 128   | Number of times a row migrated from a CU                                                                                                                            |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                                       | Class | Description                                                                    | TIMED_STATISTICS |
|------------------------------------------------------------|-------|--------------------------------------------------------------------------------|------------------|
| index cmph dm, insert unpurge CU row                       | 128   | Number of times a CU row was unpurged during insert                            |                  |
| index cmph dm, purge dummy CU                              | 128   | Number of times dummy CU purged from leaf block                                |                  |
| index cmph dm, split for cu lock expand                    | 128   | Number of times leaf block split for CU lock expansion                         |                  |
| index cmph dm, split for cu migrate row                    | 128   | Number of leaf block splits due to CU row migration                            |                  |
| index cmph ld, CU fit                                      | 128   | Number of times load created a well sized CU, no space for uncompressed rows   |                  |
| index cmph ld, CU fit, add rows                            | 128   | Number of times load created a well sized CU, with space for uncompressed rows |                  |
| index cmph ld, CU negative comp                            | 128   | Number of times load CU gave negative compression                              |                  |
| index cmph ld, CU over-est                                 | 128   | Number of times load created an oversized CU                                   |                  |
| index cmph ld, CU under-est                                | 128   | Number of times load created a small CU                                        |                  |
| index cmph ld, infinite loop                               | 128   | Number of times shrink CU attempts resulted in uncompressed rows               |                  |
| index cmph ld, lf blks flushed                             | 128   | Number of leaf blocks flushed by load                                          |                  |
| index cmph ld, lf blks w/ und CU                           | 128   | Number of leaf blocks flushed with small CU                                    |                  |
| index cmph ld, lf blks w/o CU                              | 128   | Number of leaf blocks flushed without a CU                                     |                  |
| index cmph ld, lf blks w/o unc r                           | 128   | Number of leaf blocks flushed without uncompressed rows                        |                  |
| index cmph ld, retry in over-est                           | 128   | Number of times CU was resized after creating an oversized CU                  |                  |
| index cmph ld, rows compressed                             | 128   | Number of rows compressed by load                                              |                  |
| index cmph ld, rows uncompressed                           | 128   | Number of rows left uncompressed by load                                       |                  |
| index cmph sc, ffs decomp buffers                          | 128   | Number of blocks decompressed for fast scan                                    |                  |
| index cmph sc, ffs decomp buffers released and found valid | 128   | Number of times decompressed CU buffer was reused by fast scan                 |                  |
| index cmph sc, ffs decomp buffers rows avail               | 128   | Number of rows in decompressed buffer for fast scan                            |                  |
| index cmph sc, ffs decomp buffers rows used                | 128   | Number of rows used from decompressed buffer for fast scan                     |                  |
| index cmph sc, ffs decomp failures                         | 128   | Number of time decompress CU was not possible for fast scan                    |                  |
|                                                            | 128   | Number of times 90-10 leaf block CU splits were made 50-50                     |                  |
| index cmph sp, leaf norecomp limit                         | 128   | Number of times leaf block recompression reached the recompression limit       |                  |
| index cmph sp, leaf norecomp negcomp                       | 128   | Number of times leaf block recompression returned negative compression         |                  |
| index cmph sp, leaf norecomp nospace                       | 128   | Number of times leaf block recompression returned not enough space             |                  |

| index cmph sp, leaf recomp zero ucs       | 128   | Number of CUs created with zero sentinels                                                                                                                                                                                                                                                                        |                  |
| index cmph sp, leaf recompress            | 128   | Number of times a leaf block CU was recompressed                                                                                                                                                                                                                                                                 |                  |
| index cmpl co, prefix mismatch            | 128   | Number of times reorg found a neighboring block prefix count mismatch                                                                                                                                                                                                                                            |                  |
| index cmpl ro, blocks not compressed      | 128   | Number of times prefix compression was not applied to avoid negative compression                                                                                                                                                                                                                                 |                  |
| index cmpl ro, prefix change at block     | 128   | Number of times prefix count was changed to an optimal value                                                                                                                                                                                                                                                     |                  |
| index cmpl ro, prefix no change at block  | 128   | Number of times prefix count was already the optimal value                                                                                                                                                                                                                                                       |                  |
| index cmpl ro, reorg avoid load new block | 128   | Number of times a block reorg avoided a new block being created during load                                                                                                                                                                                                                                      |                  |
| index cmpl ro, reorg avoid split          | 128   | Number of times a block reorg avoided a block split during DML                                                                                                                                                                                                                                                   |                  |
| index fast full scans (direct read)       | 64    | Number of fast full scans initiated using direct read                                                                                                                                                                                                                                                            |                  |
| index fast full scans (full)              | 64    | Number of fast full scans initiated for full segments                                                                                                                                                                                                                                                            |                  |
| index fast full scans (rowid ranges)      | 64    | Number of fast full scans initiated with rowid endpoints specified                                                                                                                                                                                                                                               |                  |
| large tracked transactions                | 128   | For tables tracked by flashback data archive, the number of transactions modifying rows in those tables which are large in terms of size or number of changes                                                                                                                                                    |                  |
| leaf node splits                          | 128   | Number of times an index leaf node was split because of the insertion of an additional value                                                                                                                                                                                                                     |                  |
| lob reads                                 | 8     | Number of LOB API read operations performed in the session/system. A single LOB API read may correspond to multiple physical/logical disk block reads.                                                                                                                                                           |                  |
| lob writes                                | 8     | Number of LOB API write operations performed in the session/system. A single LOB API write may correspond to multiple physical/logical disk block writes.                                                                                                                                                        |                  |
| lob writes unaligned                      | 8     | Number of LOB API write operations whose start offset or buffer size is not aligned to the internal chunk size of the LOB. Writes aligned to chunk boundaries are the most efficient write operations. The internal chunk size of a LOB is available through the LOB API (for example, DBMS_LOB.GETCHUNKSIZE()). |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                    | Class | Description                                                                                                                                                                                                                                                    | TIMED_STATISTICS |
|-----------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| logons cumulative                       | 1     | Total number of logons since the instance started. Useful only in V\$SYSSTAT. It gives an instance overview of all processes that logged on.                                                                                                                   |                  |
| logons current                          | 1     | Total number of current logons. Useful only in V\$SYSSTAT.                                                                                                                                                                                                     |                  |
| memopt r failed puts                    | 128   | Total failed puts on hash index                                                                                                                                                                                                                                |                  |
| memopt r failed reads on blocks         | 128   | Total lookup failures due to read failure on blocks because of concurrent changes                                                                                                                                                                              |                  |
| memopt r failed reads on buckets        | 128   | Total lookup failures due to concurrent hash bucket changes                                                                                                                                                                                                    |                  |
| memopt r hits                           | 128   | Total hits on hash index – primary key found                                                                                                                                                                                                                   |                  |
| memopt r lookup detected CR buffer      | 128   | Total lookup failures due to block pointed to by hash index being no longer the current version                                                                                                                                                                |                  |
| memopt r lookups                        | 128   | Total number of lookups on hash index                                                                                                                                                                                                                          |                  |
| memopt r misses                         | 128   | Total misses on hash index due to primary key not found                                                                                                                                                                                                        |                  |

| memopt r successful puts                | 128   | Total successful puts on hash index                                                                                                                                                                                                                            |                  |
| messages received                       | 128   | Number of messages sent and received between background processes                                                                                                                                                                                              |                  |
| messages sent                           | 128   | Number of messages sent and received between background processes                                                                                                                                                                                              |                  |
| MLE JIT compilation duration cumulative | 1     | Total amount of cpu time (in milliseconds) spent by asynchronous just-in-time compilations for a session                                                                                                                                                       |                  |
| MLE JIT compilation duration max        | 1     | Duration (in milliseconds) of the most time-consuming just-in-time compilation per session (not applicable for V\$SYSSTAT)                                                                                                                                     |                  |
| MLE JIT compilation error count         | 1     | Number of just-in-time compilation operations in a session that failed with an error                                                                                                                                                                           |                  |
| MLE JIT compilation success count       | 1     | Number of successful just-in-time compilations in a session                                                                                                                                                                                                    |                  |
| MLE full GC accumulated time            | 1     | Cumulative time (in milliseconds) spent collecting the entire MLE heap                                                                                                                                                                                         |                  |
| MLE full GC count                       | 1     | Number of times the entire MLE heap was collected                                                                                                                                                                                                              |                  |
| MLE incremental GC accumulated time     | 1     | Cumulative time (in milliseconds) spent collecting the young-generation portion of the MLE heap                                                                                                                                                                |                  |
| MLE incremental GC count                | 1     | Number of times the young-generation portion of the MLE heap was collected                                                                                                                                                                                     |                  |
| MLE total memory in use                 | 1     | Total amount of memory (in bytes) used for the MLE instance in a session, across all contexts                                                                                                                                                                  |                  |
| no buffer to keep pinned count          | 72    | Number of times a visit to a buffer attempted, but the buffer was not found where expected. Like " <a href="#">buffer is not pinned count</a> " and " <a href="#">buffer is pinned count</a> ", this statistic is useful only for internal debugging purposes. |                  |
| no work - consistent read gets          | 128   | Number consistent gets that require neither block cleanouts nor rollbacks.<br><b>See Also:</b> " <a href="#">consistent gets</a> "                                                                                                                             |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                   | Class | Description                                                                                                                                                                                                                                                                              | TIMED_STATISTICS |
|----------------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| non-idle wait count                    | 1     | The total number of waits performed with wait events that were not part of the Idle wait class.<br><b>See Also:</b> <a href="#">"in call idle wait time"</a> and <a href="#">"non-idle wait time"</a>                                                                                    |                  |
| non-idle wait time                     | 1     | The total wait time (in microseconds) for waits that do not belong to the Idle wait class.<br><b>See Also:</b> <a href="#">"in call idle wait time"</a> and <a href="#">"non-idle wait count"</a>                                                                                        |                  |
| OLAP Aggregate Function Calc           | 64    | The number of times the AGGREGATE function computes a parent value based on the values of its children.                                                                                                                                                                                  |                  |
| OLAP Aggregate Function Logical NA     | 64    | The number of times an AGGREGATE function evaluates to a logical NA value. This could be because the AGGINDEX is on and the composite tuple does not exist.                                                                                                                              |                  |
| OLAP Aggregate Function Precompute     | 64    | The number of times the AGGREGATE function is to compute a value and finds it precomputed in the cube.                                                                                                                                                                                   |                  |
| OLAP Custom Member Limit               | 64    | The number of times an OLAP table function issues a custom member limit                                                                                                                                                                                                                  |                  |
| OLAP Engine Calls                      | 64    | The total number of OLAP transactions executed within the session. This value provides a general indication of the level of OLAP activity in the session.                                                                                                                                |                  |
| OLAP Fast Limit                        | 64    | The number of times an OLAP table function issues a fast limit                                                                                                                                                                                                                           |                  |
| OLAP Full Limit                        | 64    | The number of times an OLAP table function issues a full limit                                                                                                                                                                                                                           |                  |
| OLAP GID Limit                         | 64    | The number of times an OLAP table function issues a Cube Grouping ID (CGID) limit. Typically, this type of limit occurs for query rewrite transformations that resolve to a cube organized materialized view.                                                                            |                  |
| OLAP Import Rows Loaded                | 64    | The number of OLAP import rows loaded. This statistic provides the number of rows of the source cursor that are actually loaded into an Analytic Workspace (AW).<br>The difference between the OLAP Import Rows Pushed and OLAP Import Rows Loaded provides the number of rejected rows. |                  |
| OLAP Import Rows Pushed                | 64    | The number of OLAP import rows pushed. This statistic refers to the number of rows encountered from a source cursor and is useful during cube build operations.                                                                                                                          |                  |
| OLAP INHIER Limit                      | 64    | The number of times an OLAP table function issues an in-hierarchy limit. This type of limit can occur when you use cube dimension hierarchy views.                                                                                                                                       |                  |
| OLAP Limit Time                        | 64    | The total time taken by all the OLAP Limit operations that were performed during the last call to the OLAP table function                                                                                                                                                                |                  |
| OLAP Paging Manager Cache Changed Page | 64    | The number of times the OLAP page pool is changed for any attached AW.                                                                                                                                                                                                                   |                  |
| OLAP Paging Manager Cache Hit          | 64    | The number of times a requested page is found in the OLAP page pool. Use this statistic in conjunction with <a href="#">OLAP Paging Manager Cache Miss</a> to determine the OLAP page pool efficiency ratio.                                                                             |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                            | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | TIMED_STATISTICS |

| OLAP Paging Manager Cache Miss  | 64    | The number of times a requested page is not found in the OLAP page pool. Use this statistic in conjunction with OLAP Paging Manager Cache Hit to determine the OLAP page pool efficiency ratio.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| OLAP Paging Manager Cache Write | 64    | The number of times the OLAP paging manager writes to a page in the OLAP page pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| OLAP Paging Manager New Page    | 64    | The number of newly-created pages in the OLAP page pool that have not yet been written to the workspace LOB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |
| OLAP Paging Manager Pool Size   | 64    | Size, in bytes, of the OLAP page pool allocated to a session and the sum of all OLAP page pools in the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| OLAP Perm LOB Read              | 64    | The number of times data was read from the table where the AW is stored. These are permanent LOB reads.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| OLAP Row Id Limit               | 64    | The number of times an OLAP table function issues a row Id limit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |
| OLAP Row Load Time              | 64    | <p>The total time spent loading rows into an AW during cube build and OLAP SQL import operations.</p> <p>Use this statistic along with the <a href="#">OLAP engine elapsed time</a> to measure time spent running OLAP engine routines that involve loading data into AWs from a SQL source.</p> <p>This statistic has the following levels of precision:</p> <ul style="list-style-type: none"> <li>Low precision timer <p>This captures the elapsed time of the entire fetch phase of the SQL cursor that is being loaded into AWs. It includes the SQL execution time that occurs during a fetch operation from a source cursor and time taken by the OLAP engine to populate AWs.</p> </li> <li>High precision timer <p>This captures the elapsed time, excluding the SQL processing of the cursor being loaded. It records the time spent in the OLAP engine only.</p> </li> <li>Default timer precision: <p>This is based on the <code>STATISTIC_LEVEL</code> parameter. If the low precision is used, then <code>STATISTICS_LEVEL</code> is TYPICAL. The high precision timer is used when <code>STATISTIC_LEVEL</code> is set to ALL. No timing is captured when <code>STATISTICS_LEVEL</code> is BASIC.</p> </li> </ul> |                  |
| OLAP Row Source Rows Processed  | 64    | The number of rows processed by the OLAP row source                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| OLAP Session Cache Hit          | 64    | The number of times the requested, dynamically-aggregated value of an AW object, was found in the OLAP session cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |

| OLAP Temp Segment Read          | 64    | The number of times data was read from a temporary segment and not from the OLAP page pool                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                  |
| OLAP Temp Segments              | 64    | The number of OLAP pages stored in temporary segments for analytic workspaces                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                        | Class | Description                                                                                                                                                                                                              | TIMED_STATISTICS |
|---------------------------------------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| OLAP Unique Key Attribute Limit             | 64    | The number of times an OLAP table function issues a unique key attribute limit                                                                                                                                           |                  |
| opened cursors cumulative                   | 1     | In V\$SYSSTAT: Total number of cursors opened since the instance started.<br>In V\$SESSTAT: Total number of cursors opened since the start of the session.                                                               |                  |
| opened cursors current                      | 1     | Total number of current open cursors                                                                                                                                                                                     |                  |
| OS CPU Qt wait time                         | 1     | The time a session spends on the CPU run queue (in microseconds), waiting to get the CPU to run                                                                                                                          |                  |
| OS Involuntary context switches             | 16    | Number of context switches that were enforced by the operating system                                                                                                                                                    |                  |
| OS Signals received                         | 16    | Number of signals received                                                                                                                                                                                               |                  |
| OS Swaps                                    | 16    | Number of swap pages                                                                                                                                                                                                     |                  |
| OS Voluntary context switches               | 16    | Number of voluntary context switches (for example, when a process gives up the CPU by a SLEEP() system call)                                                                                                             |                  |
| Parallel operations downgraded 1 to 25 pct  | 32    | Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers                                                                            |                  |
| Parallel operations downgraded 25 to 50 pct | 32    | Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers                                                                            |                  |
| Parallel operations downgraded 50 to 75 pct | 32    | Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers                                                                            |                  |
| Parallel operations downgraded 75 to 99 pct | 32    | Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers                                                                            |                  |
| Parallel operations downgraded to serial    | 32    | Number of times parallel execution was requested but execution was serial because of insufficient parallel execution servers                                                                                             |                  |
| Parallel operations not downgraded          | 32    | Number of times parallel execution was executed at the requested degree of parallelism                                                                                                                                   |                  |
| parse count (describe)                      | 64    | Total number of parse calls on a describe cursor. This operation is a less expensive than a hard parse and more expensive than a soft parse.                                                                             |                  |
| parse count (hard)                          | 64    | Total number of parse calls (real parses). A hard parse is a very expensive operation in terms of memory use, because it requires Oracle to allocate a workheap and other memory structures and then build a parse tree. |                  |
| parse count (total)                         | 64    | Total number of parse calls (hard, soft, and describe). A soft parse is a check on an object already in the shared pool, to verify that the permissions on the underlying object have not changed.                       |                  |
| parse time cpu                              | 64    | Total CPU time used for parsing (hard and soft) in 10s of milliseconds                                                                                                                                                   | Y                |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                     | Class | Description                                                                                                                                                                                                                                                                                                                                                          | TIMED_STATISTICS |
|------------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| parse time elapsed                       | 64    | Total elapsed time for parsing, in 10s of milliseconds. Subtract "parse time cpu" from this statistic to determine the total waiting time for parse resources.                                                                                                                                                                                                       | Y                |
| physical maps pmem                       | 264   | Number of direct-mapped references acquired from FsDirect. Note that in steady state this is approximately the same as the number of unmaps, because each map requires an unmap (e.g. reuses a PMEM buffer).                                                                                                                                                         |                  |
| physical read bytes                      | 8     | Total size in bytes of all disk reads by application activity (and not other instance activity) only.                                                                                                                                                                                                                                                                |                  |
| physical read flash cache hits           | 8     | Total number of reads from flash cache instead of disk                                                                                                                                                                                                                                                                                                               |                  |
| physical read IO requests                | 8     | Number of read requests for application activity (mainly buffer cache and direct load operation) which read one or more database blocks per request. This is a subset of "physical read total IO requests" statistic.                                                                                                                                                |                  |
| physical read requests optimized         | 8     | Number of read requests that read one or more database blocks from the Database Smart Flash Cache or the Exadata Smart Flash Cache.                                                                                                                                                                                                                                  |                  |
| physical read total bytes                | 8     | Total size in bytes of disk reads by all database instance activity including application reads, backup and recovery, and other utilities. The difference between this value and "physical read bytes" gives the total read size in bytes by non-application workload.                                                                                               |                  |
| physical read total IO requests          | 8     | Number of read requests which read one or more database blocks for all instance activity including application, backup and recovery, and other utilities.<br><br>The difference between this value and "physical read total multi block requests" gives the total number of small I/O requests which are less than 128 kilobytes down to single block read requests. |                  |
| physical read total multi block requests | 8     | Total number of Oracle instance read requests which read 128 kilobytes or more in two or more database blocks per request for all instance activity including application, backup and recovery, and other utilities.                                                                                                                                                 |                  |
| physical reads                           | 8     | Total number of data blocks read from disk. This value can be greater than the value of "physical reads direct" plus "physical reads cache" as reads into process private buffers also included in this statistic.                                                                                                                                                   |                  |
| physical reads cache                     | 8     | Total number of data blocks read from disk into the buffer cache. This is a subset of "physical reads" statistic.                                                                                                                                                                                                                                                    |                  |
| physical reads cache prefetch            | 8     | Number of contiguous and noncontiguous blocks that were prefetched.                                                                                                                                                                                                                                                                                                  |                  |
| physical reads direct                    | 8     | Number of reads directly from disk, bypassing the buffer cache. For example, in high bandwidth, data-intensive operations such as parallel query, reads of disk blocks bypass the buffer cache to maximize transfer rates and to prevent the premature aging of shared data blocks resident in the buffer cache.                                                     |                  |
| physical reads direct (lob)              | 8     | Number of buffers that were read directly for LOBs                                                                                                                                                                                                                                                                                                                   |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                       | Class | Description                                                                                                                                                                                                                                                                                             | TIMED_STATISTICS |
|--------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| physical reads direct temporary tablespace | 8     | Number of buffers that were read directly from temporary tablespaces                                                                                                                                                                                                                                    |                  |
| physical reads for flashback new           | 8     | Number of blocks read for newing (that is, preparing a data block for a completely new change) blocks while flashback database is enabled                                                                                                                                                               |                  |
| physical reads pmem                        | 8     | Number of blocks read/copied from PMEM into DRAM cache                                                                                                                                                                                                                                                  |                  |
| physical reads pmem decrypt                | 8     | Number of blocks read/copied from PMEM into DRAM cache due to the need for decryption. This is a subset of "physical reads pmem" statistics value.                                                                                                                                                      |                  |
| physical reads pmem direct path            | 8     | Number of blocks read from PMEM into PGA memory due to direct path access. This is a subset of "physical reads pmem" statistics value.                                                                                                                                                                  |                  |
| physical reads pmem exclusive              | 8     | Number of blocks read/copied from PMEM into DRAM cache due to exclusive access requests, which prevents other processes from accessing the block on PMEM directly. This is a subset of "physical reads pmem" statistics value.                                                                          |                  |
| physical reads pmem modification           | 8     | Number of blocks read/copied from PMEM into DRAM cache due to modification. This is a subset of "physical reads pmem" statistics value.                                                                                                                                                                 |                  |
| physical reads pmem promote                | 8     | Number of blocks read/copied from PMEM into DRAM cache due to hot block promotion. This is a subset of "physical reads pmem" statistics value. This statistic is further categorized into "hot pmem block migration to dram successes" and "hot pmem block exchange with dram successes" statistics.    |                  |
| physical reads pmem rollback               | 8     | Number of blocks read/copied from PMEM into DRAM cache due to CR rollback. This is a subset of "physical reads pmem" statistics value.                                                                                                                                                                  |                  |
| physical reads prefetch warmup             | 8     | Number of data blocks that were read from the disk during the automatic prewarming of the buffer cache.                                                                                                                                                                                                 |                  |
| physical unmaps pmem forced                | 264   | Number of forfeited direct-mapped references requested by FsDirect due to PMEM memory pressure                                                                                                                                                                                                          |                  |
| physical write bytes                       | 8     | Total size in bytes of all disk writes from the database application activity (and not other kinds of instance activity).                                                                                                                                                                               |                  |
| physical write IO requests                 | 8     | Number of write requests for application activity (mainly buffer cache and direct load operation) which wrote one or more database blocks per request.                                                                                                                                                  |                  |
| physical write total bytes                 | 8     | Total size in bytes of all disk writes for the database instance including application activity, backup and recovery, and other utilities. The difference between this value and "physical write bytes" gives the total write size in bytes by non-application workload.                                |                  |
| physical write total IO requests           | 8     | Number of write requests which wrote one or more database blocks from all instance activity including application activity, backup and recovery, and other utilities. The difference between this stat and "physical write total multi block requests" gives the number of single block write requests. |                  |

| Name                                        | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | TIMED_STATISTICS |
|---------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| physical write total multi block requests   | 8     | Total number of Oracle instance write requests which wrote two or more blocks per request to the disk for all instance activity including application activity, recovery and backup, and other utilities.                                                                                                                                                                                                                                                                                                               |                  |
| physical writes                             | 8     | Total number of data blocks written to disk. This statistics value equals the sum of "physical writes direct" and "physical writes from cache" values.                                                                                                                                                                                                                                                                                                                                                                  |                  |
| physical writes direct                      | 8     | Number of writes directly to disk, bypassing the buffer cache (as in a direct load operation)                                                                                                                                                                                                                                                                                                                                                                                                                           |                  |
| physical writes direct (lob)                | 8     | Number of buffers that were directly written for LOBs                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| physical writes direct temporary tablespace | 8     | Number of buffers that were directly written for temporary tablespaces                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| physical writes from cache                  | 8     | Total number of data blocks written to disk from the buffer cache. This is a subset of "physical writes" statistic.                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| physical writes non checkpoint              | 8     | Number of times a buffer is written for reasons other than advancement of the checkpoint. Used as a metric for determining the I/O overhead imposed by setting the <code>FAST_START_IO_TARGET</code> parameter to limit recovery I/Os. (Note that <code>FAST_START_IO_TARGET</code> is a deprecated parameter.) Essentially this statistic measures the number of writes that would have occurred had there been no checkpointing. Subtracting this value from "physical writes" gives the extra I/O for checkpointing. |                  |
| pinned buffers inspected                    | 8     | Number of times a user process, when scanning the tail of the replacement list looking for a buffer to reuse, encountered a cold buffer that was pinned or had a waiter that was about to pin it. This occurrence is uncommon, because a cold buffer should not be pinned very often.                                                                                                                                                                                                                                   |                  |
| pinned buffers inspected for pmem           | 8     | Number of times a user process, when scanning the tail of the replacement list looking for a PMEM buffer to reuse in DRAM, encountered a cold buffer that was pinned or had a waiter that was about to pin it. This occurrence is uncommon, because a cold buffer should not be pinned very often.                                                                                                                                                                                                                      |                  |
| prefetched blocks aged out before use       | 8     | Number of contiguous and noncontiguous blocks that were prefetched but aged out before use                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| process last non-idle time                  | 128   | The last time this process executed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Y                |
| PX local messages rcv'd                     | 32    | Number of local messages received for parallel execution within the instance local to the current session                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| PX local messages sent                      | 32    | Number of local messages sent for parallel execution within the instance local to the current session                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |

| recovery blocks read for lost write detection | 8     | Number of blocks read for lost write checks during recovery.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| recovery blocks skipped lost write checks     | 8     | Number of Block Read Records that skipped the lost write check during recovery.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| recursive calls                               | 1     | Number of recursive calls generated at both the user and system level. Oracle maintains tables used for internal processing. When Oracle needs to make a change to these tables, it internally generates an internal SQL statement, which in turn generates a recursive call.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                  |
| recursive cpu usage                           | 1     | Total CPU time used by non-user calls (recursive calls). Subtract this value from " <a href="#">CPU used by this session</a> " to determine how much CPU time was used by the user calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| redo blocks checksummed by FG (exclusive)     | 2     | Number of exclusive redo blocks that were checksummed by the generating foreground processes. An exclusive redo block is the one whose entire redo content belongs to a single redo entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                  |
| redo blocks checksummed by LGWR               | 2     | Number of redo blocks that were checksummed by the LGWR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |
| redo blocks written                           | 2     | Total number of redo blocks written. This statistic divided by " <a href="#">redo writes</a> " equals number of blocks per write.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |
| redo buffer allocation retries                | 2     | Total number of retries necessary to allocate space in the redo buffer. Retries are needed either because the redo writer has fallen behind or because an event such as a log switch is occurring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |
| redo entries                                  | 2     | Number of times a redo entry is copied into the redo log buffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| redo entries for lost write detection         | 2     | Number of times a Block Read Record is copied into the log buffer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |
| redo log space requests                       | 2     | <p>Number of times the active log file is full and Oracle must wait for disk space to be allocated for the redo log entries. Such space is created by performing a log switch.</p> <p>Log files that are small in relation to the size of the SGA or the commit rate of the work load can cause problems. When the log switch occurs, Oracle must ensure that all committed dirty buffers are written to disk before switching to a new log file. If you have a large SGA full of dirty buffers and small redo log files, a log switch must wait for DBWR to write dirty buffers to disk before continuing.</p> <p>Also examine the <b>log file space</b> and <b>log file space switch</b> wait events in V\$SESSION_WAIT</p> |                  |
| redo log space wait time                      | 2     | Total time waited in centiseconds for available space in the redo log buffer. See also " <a href="#">redo log space requests</a> "                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Y                |
| redo ordering marks                           | 2     | Number of times that a system change number was allocated to force a redo record to have a higher SCN than a record generated in another thread using the same block                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| redo size                                     | 2     | Total amount of redo generated in bytes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                  |
| redo size for lost write detection            | 2     | Total amount of Block Read Records generated in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                    | Class | Description                                                                                                                                                                                                                                                                                                       | TIMED_STATISTICS |
|-----------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| redo synch time                         | 8     | Elapsed time of all " <a href="#">redo synch writes</a> " calls in 10s of milliseconds                                                                                                                                                                                                                            | Y                |
| redo synch writes                       | 8     | Number of times the redo is forced to disk, usually for a transaction commit. The log buffer is a circular buffer that LGWR periodically flushes. Usually, redo that is generated and copied into the log buffer need not be flushed out to disk immediately.                                                     |                  |
| redo wastage                            | 2     | Number of bytes wasted because redo blocks needed to be written before they are completely full. Early writing may be needed to commit transactions, to be able to write a database buffer, or to switch logs.                                                                                                    |                  |
| redo write broadcast ack count          | 2     | Number of times a commit broadcast acknowledgment has not been received by the time when the corresponding log write is completed. This is only for Oracle RAC.                                                                                                                                                   |                  |
| redo write broadcast ack time           | 2     | Total amount of the latency associated with broadcast on commit beyond the latency of the log write (in microseconds). This is only for Oracle RAC.                                                                                                                                                               | Y                |
| redo write time                         | 2     | Total elapsed time of the write from the redo log buffer to the current redo log file in 10s of milliseconds                                                                                                                                                                                                      | Y                |
| redo writes                             | 2     | Total number of writes by LGWR to the redo log files. "redo blocks written" divided by this statistic equals the number of blocks per write                                                                                                                                                                       |                  |
| rollback changes - undo records applied | 128   | Number of undo records applied to user-requested rollback changes (not consistent-read rollbacks)                                                                                                                                                                                                                 |                  |
| rollbacks only - consistent read gets   | 128   | Number of consistent gets that require only block rollbacks, no block cleanouts.<br><b>See Also:</b> " <a href="#">consistent gets</a> "                                                                                                                                                                          |                  |
| rows fetched via callback               | 64    | Rows fetched via callback. Useful primarily for internal debugging purposes.                                                                                                                                                                                                                                      |                  |
| scheduler wait time                     | 1     | The total wait time (in microseconds) for waits that belong to the Scheduler wait class                                                                                                                                                                                                                           |                  |
| SCN increments due to another database  | 128   | SCN increments due to communication with another database                                                                                                                                                                                                                                                         |                  |
| serializable aborts                     | 1     | Number of times a SQL statement in a serializable isolation level had to terminate                                                                                                                                                                                                                                |                  |
| session connect time                    | 1     | The connect time for the session in 10s of milliseconds. This value is useful only in V\$SESSTAT. It is the wall clock time since the logon to this session occurred.                                                                                                                                             | Y                |
| session cursor cache count              | 64    | Total number of cursors cached. This statistic is incremented only if SESSION_CACHED_CURSORS > 0. This statistic is the most useful in V\$SESSTAT. If the value for this statistic in V\$SESSTAT is close to the setting of the SESSION_CACHED_CURSORS parameter, the value of the parameter should be increased. |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                  | Class | Description                                                                                                                                                                                                                                                                           | TIMED_STATISTICS |
|---------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| session cursor cache hits             | 64    | Number of hits in the session cursor cache. A hit means that the SQL (including recursive SQL) or PL/SQL statement did not have to be reparsed. Subtract this statistic from " <a href="#">parse count (total)</a> " to determine the real number of parses that occurred.            |                  |
| session logical reads                 | 1     | The sum of "db block gets" plus "consistent gets". This includes logical reads of database blocks from either the buffer cache or process private memory.                                                                                                                             |                  |
| session logical reads - IM            | 128   | Number of database blocks read from the IM column store (number of blocks in IMCU - number of blocks with invalid rows)                                                                                                                                                               |                  |
| session pga memory                    | 1     | Current PGA size for the session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.                                                                                                                                                                                         |                  |
| session pga memory max                | 1     | Peak PGA size for the session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.                                                                                                                                                                                            |                  |
| session stored procedure space        | 1     | Amount of memory this session is using for stored procedures                                                                                                                                                                                                                          |                  |
| session uga memory                    | 1     | Current UGA size for the session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.                                                                                                                                                                                         |                  |
| session uga memory max                | 1     | Peak UGA size for a session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.                                                                                                                                                                                              |                  |
| shared hash latch upgrades - no wait  | 8     | A shared hash latch upgrade is when a hash latch is upgraded from shared mode to exclusive mode. This statistic displays the number of times the upgrade completed immediately.                                                                                                       |                  |
| shared hash latch upgrades - wait     | 8     | A shared hash latch upgrade is when a hash latch is upgraded from shared mode to exclusive mode. This statistics displays the number of times the upgrade did not complete immediately.                                                                                               |                  |
| shared io pool buffer get failure     | 128   | Number of unsuccessful buffer gets from the shared I/O pool from instance startup time.                                                                                                                                                                                               |                  |
| shared io pool buffer get success     | 128   | Number of successful buffer gets from the shared I/O pool from instance startup time.                                                                                                                                                                                                 |                  |
| slave propagated tracked transactions | 128   | Number of transactions modifying tables enabled for flashback data archive which were archived by a worker process                                                                                                                                                                    |                  |
| sorts (disk)                          | 64    | Number of sort operations that required at least one disk write<br>Sorts that require I/O to disk are quite resource intensive. Try increasing the size of the initialization parameter SORT_AREA_SIZE. For more information, see " <a href="#">SORT_AREA_SIZE</a> ".                 |                  |
| sorts (memory)                        | 64    | Number of sort operations that were performed completely in memory and did not require any disk writes<br>You cannot do much better than memory sorts, except maybe no sorts at all. Sorting is usually caused by selection criteria specifications within table join SQL operations. |                  |
| sorts (rows)                          | 64    | Total number of rows sorted                                                                                                                                                                                                                                                           |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | TIMED_STATISTICS |
|-------------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| SQL*Net roundtrips to/from client   | 1     | Total number of Oracle Net Services messages sent to and received from the client                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |
| SQL*Net roundtrips to/from dblink   | 1     | Total number of Oracle Net Services messages sent over and received from a database link                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| summed dirty queue length           | 8     | The sum of the dirty LRU queue length after every write request. Divide by <b>write requests</b> to get the average queue length after write completion.                                                                                                                                                                                                                                                                                                                                                               |                  |
| switch current from pmem            | 8     | Number of times the CURRENT PMEM block moved to a DRAM buffer, leaving a CR block in the original PMEM buffer. This happens when one Oracle process pins a CURRENT PMEM buffer for read, and another Oracle process wants to pin the same buffer for modification. The latter process clones the PMEM buffer into a new DRAM buffer for modification, while converting the original PMEM current buffer into a PMEM CR buffer.                                                                                         |                  |
| switch current to new buffer        | 8     | Number of times the CURRENT block moved to a different buffer, leaving a CR block in the original buffer                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| table fetch by rowid                | 64    | Number of rows that are fetched using a ROWID (usually recovered from an index)<br><br>This occurrence of table scans usually indicates either non-optimal queries or tables without indexes. Therefore, this statistic should increase as you optimize queries and provide indexes in the application.                                                                                                                                                                                                                |                  |
| table fetch continued row           | 64    | Number of times a chained or migrated row is encountered during a fetch<br><br>Retrieving rows that span more than one block increases the logical I/O by a factor that corresponds to the number of blocks that need to be accessed. Exporting and re-importing may eliminate this problem. Evaluate the settings for the storage parameters PCTFREE and PCTUSED. This problem cannot be fixed if rows are larger than database blocks (for example, if the LONG data type is used and the rows are extremely large). |                  |
| table scan blocks gotten            | 64    | During scanning operations, each row is retrieved sequentially by Oracle. This statistic counts the number of blocks encountered during the scan.<br><br>This statistic tells you the number of database blocks that you had to get from the buffer cache for the purpose of scanning. Compare this value with the value of " <a href="#">consistent gets</a> " to determine how much of the consistent read activity can be attributed to scanning.                                                                   |                  |
| table scan disk IMC fallback        | 128   | Number of rows fetched from the buffer cache because they were not present in the IM column store (in a scan that was otherwise performed in memory)                                                                                                                                                                                                                                                                                                                                                                   |                  |
| table scan disk non-IMC rows gotten | 128   | Number of rows fetched during non-In-Memory scan                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                  |
| table scan rows gotten              | 64    | Number of rows that are processed during scanning operations                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                                       | Class | Description                                                                                                                                                                                 | TIMED_STATISTICS |
|------------------------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| table scans (cache partitions)                             | 64    | Number of range scans performed on tables that have the CACHE option enabled                                                                                                                |                  |
| table scans (direct read)                                  | 64    | Number of table scans performed with direct read (bypassing the buffer cache)                                                                                                               |                  |
| table scans (IM)                                           | 128   | Number of segments / granules scanned using In-Memory                                                                                                                                       |                  |
| table scans (long tables)                                  | 64    | Long (or conversely short) tables can be defined as tables that do not meet the short table criteria as described in " <a href="#">table scans (short tables)</a> "                         |                  |
| table scans (rowid ranges)                                 | 64    | During parallel query, the number of table scans conducted with specified ROWID ranges                                                                                                      |                  |
| table scans (short tables)                                 | 64    | Long (or conversely short) tables can be defined by optimizer hints coming down into the row source access layer of Oracle. The table must have the CACHE option set.                       |                  |
| tracked rows                                               | 128   | Number of rows modified in tables enabled for flashback data archive                                                                                                                        |                  |
| tracked transactions                                       | 128   | Number of transactions which modified a table enabled for flashback data archive                                                                                                            |                  |
| transaction lock background get time                       | 128   | Useful only for internal debugging purposes                                                                                                                                                 |                  |
| transaction lock background gets                           | 128   | Useful only for internal debugging purposes                                                                                                                                                 |                  |
| transaction lock foreground requests                       | 128   | Useful only for internal debugging purposes                                                                                                                                                 |                  |
| transaction lock foreground wait time                      | 128   | Useful only for internal debugging purposes                                                                                                                                                 |                  |
| transaction rollbacks                                      | 128   | Number of transactions being successfully rolled back                                                                                                                                       |                  |
| transaction tables consistent read rollbacks               | 128   | Number of times rollback segment headers are rolled back to create consistent read blocks                                                                                                   |                  |
| transaction tables consistent reads - undo records applied | 128   | Number of undo records applied to transaction tables that have been rolled back for consistent read purposes                                                                                |                  |
| True Cache potentially current buffer made CR              | 264   | Count of data blocks arriving at True Cache as potentially current buffers due to timing conditions, and later deemed to be good only as consistent read buffers, so they will be aged out. |                  |
| True Cache potentially current buffer made current         | 264   | Count of data blocks arriving at True Cache as potentially current buffers due to timing conditions, and later confirmed to be real current buffers, so redo will continue to apply.        |                  |
| True Cache: message count data send                        | 256   | Total number of messages this primary instance sends to True Cache for returning data blocks.                                                                                               |                  |
| True Cache: message count request send                     | 256   | Total number of messages this True Cache sends to the primary database for requesting data blocks.                                                                                          |                  |
| True Cache: message roundtrip time data send               | 256   | Cumulative, elapsed, round-trip messaging time in microseconds of this primary instance sending data blocks to True Cache.                                                                  |                  |
| True Cache: message roundtrip time request send            | 256   | Cumulative, elapsed, round-trip messaging time in microseconds of this True Cache sending data block fetching requests to the primary database.                                             |                  |

| TrueCache: block requests to preferred primary      | 264   | Number of block fetch requests sent to the preferred primary Oracle RAC instance with object or undo affinity.                                                                                                                                                                                                                                                                                                                                                   |                  |
| TrueCache: block requests to primary                | 264   | Total number of block fetch requests sent to the primary database.                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| txns rollback<br>priority_txns_high_wait_target     | 384   | Total number of times a LOW or MEDIUM priority transaction was rolled back by the Priority Transactions feature because the wait time specified by the PRIORITY_TXNS_HIGH_WAIT_TARGET initialization parameter was exceeded for a HIGH priority transaction<br><br>This statistic is updated when the Priority Transactions feature is enabled, that is, when the PRIORITY_TXNS_MODE initialization parameter is set to ROLLBACK.                                |                  |
| txns rollback<br>priority_txns_medium_wait_target   | 384   | Total number of times a LOW priority transaction was rolled back by the Priority Transactions feature because the wait time specified by the PRIORITY_TXNS_MEDIUM_WAIT_TARGET initialization parameter was exceeded for a MEDIUM priority transaction<br><br>This statistic is updated when the Priority Transactions feature is enabled, that is, when the PRIORITY_TXNS_MODE initialization parameter is set to ROLLBACK.                                      |                  |
| txns track mode<br>priority_txns_high_wait_target   | 384   | Total number of times a LOW or MEDIUM priority transaction would potentially be rolled back by the Priority Transactions feature because the wait time specified by the PRIORITY_TXNS_HIGH_WAIT_TARGET initialization parameter was exceeded for a HIGH priority transaction<br><br>This statistic is updated when the Priority Transactions feature is running in tracking mode, that is, when the PRIORITY_TXNS_MODE initialization parameter is set to TRACK. |                  |
| txns track mode<br>priority_txns_medium_wait_target | 384   | Total number of times a LOW priority transaction would potentially be rolled back by the Priority Transactions feature because the wait time specified by the PRIORITY_TXNS_MEDIUM_WAIT_TARGET initialization parameter was exceeded for a MEDIUM priority transaction<br><br>This statistic is updated when the Priority Transactions feature is running in tracking mode, that is, when the PRIORITY_TXNS_MODE initialization parameter is set to TRACK.       |                  |
| user calls                                          | 1     | Number of user calls such as login, parse, fetch, or execute<br><br>When determining activity, the ratio of user calls to RPI calls, give you an indication of how much internal work gets generated because of the type of requests the user is sending to Oracle.                                                                                                                                                                                              |                  |
| user commits                                        | 1     | Number of user commits. When a user commits a transaction, the redo generated that reflects the changes made to database blocks must be written to disk. Commits often represent the closest thing to a user transaction rate.                                                                                                                                                                                                                                   |                  |
| user I/O wait time                                  | 1     | The total wait time (in centiseconds) for waits that belong to the User I/O wait class                                                                                                                                                                                                                                                                                                                                                                           |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                               | Class | Description                                                                                                                                                                                                                                        | TIMED_STATISTICS |
|------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| user rollbacks                     | 1     | Number of times users manually issue the <code>ROLLBACK</code> statement or an error occurs during a user's transactions                                                                                                                           |                  |
| very large tracked transactions    | 128   | For tables tracked by flashback data archive, number of transactions modifying those tables which are very large in terms of size or number of changes                                                                                             |                  |
| write clones created in background | 8     | Number of times a background or foreground process clones a <code>CURRENT</code> buffer that is being written. The clone becomes the new, accessible <code>CURRENT</code> buffer, leaving the original buffer (now the clone) to complete writing. |                  |
| write clones created in foreground | 8     | Number of times a background or foreground process clones a <code>CURRENT</code> buffer that is being written. The clone becomes the new, accessible <code>CURRENT</code> buffer, leaving the original buffer (now the clone) to complete writing. |                  |

# F

## Background Processes

An Oracle Database **background process** is defined as any process that is listed in `V$PROCESS` and has a non-null value in the `PNAME` column.

Table F-1 describes Oracle Database background processes.

The External Properties column lists the type of instance in which the process runs. If the process is specific to a particular feature, then the column names the feature.

### Note:

When the `THREADED_EXECUTION` initialization parameter is set to `TRUE` on Linux and UNIX, the `DBW`, `PMON`, `PSP`, and `VKTM` background processes run as operating system processes, and the other background processes run as operating system threads.

See "[THREADED\\_EXECUTION](#)" for more information about the `THREADED_EXECUTION` initialization parameter.

**Table F-1 Background Processes**

| Name | Expanded Name                                                 | Short Description                                                                                                                | Long Description                                                                                                                                                                                                                                                                                                                                                                          | External Properties              |
|------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| ABMR | Auto BMR Background Process                                   | Coordinates execution of tasks such as filtering duplicate block media recovery requests and performing flood control            | When a process submits a block media recovery request to ABMR, it dynamically spawns worker processes ( <code>BMRn</code> ) to perform the recovery. ABMR and <code>BMRn</code> terminate after being idle for a long time.<br><b>See Also:</b> <i>Oracle Database Backup and Recovery User's Guide</i>                                                                                   | Database instances               |
| ACFS | Oracle Advanced Cluster File System (Oracle ACFS) CSS Process | Tracks the cluster membership in CSS and informs the file system driver of membership changes                                    | The ACFS process delivers CSS membership changes to the cluster file system. These membership changes are required for the file system to maintain file system consistency within the cluster.                                                                                                                                                                                            | Oracle ASM instances, Oracle RAC |
| ACMS | Atomic Control File to Memory Service Process                 | Coordinates consistent updates to a control file resource with its SGA counterpart on all instances in an Oracle RAC environment | The ACMS process works with a coordinating caller to ensure that an operation is executed on every instance in Oracle RAC despite failures. ACMS is the process in which a distributed operation is called. As a result, this process can exhibit a variety of behaviors. In general, ACMS is limited to small, nonblocking state changes for a limited set of cross-instance operations. | Database instances, Oracle RAC   |
| AMBn | See <a href="#">ASMB</a> , <a href="#">AMBn</a>               |                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                           |                                  |

| APnn | Replication Apply Process Coordinator Process | Obtains transactions from the reader server and passes them to apply servers                         | <p>The coordinator process name is APnn, where nn can include letters and numbers.</p> <p>For more information about the coordinator process, see <code>V\$XSTREAM APPLY_COORDINATOR</code> for XStream and <code>V\$GG APPLY_COORDINATOR</code> for Oracle GoldenGate.</p> <p><b>See Also:</b> <i>Oracle Database XStream Guide</i></p>                                                                                                                                                                                                                                                                                                                                                                                          | Database instances, Logical Standby, XStream Inbound servers, XStream Outbound servers, GoldenGate Integrated Replicat |
| AQPC | AQ Process Coordinator                        | Per instance AQ global coordinator                                                                   | AQPC is responsible for performing administrative tasks for AQ Primary Class Processes including commands like starting, stopping, and other administrative tasks. This process is automatically started on instance startup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Database instances Advanced Queueing                                                                                   |
| ARB0 | ASM Rebalance Process                         | Rebalances data extents within an Oracle ASM disk group                                              | ARB0 uses the value of the <code>ASM_POWER_LIMIT</code> initialization parameter for the Oracle ASM instance as the maximum power for disk rebalancing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Oracle ASM instances                                                                                                   |
| ARCn | Archiver Process                              | Copies the redo log files to archival storage when they are full or an online redo log switch occurs | <p>ARCn processes exist only when the database is in ARCHIVELOG mode and automatic archiving is enabled, in which case ARCn automatically archives online redo log files. LGWR cannot reuse and overwrite an online redo log group until it has been archived.</p> <p>The database starts multiple archiver processes as needed to ensure that the archiving of filled online redo logs does not fall behind. Possible processes are ARC0-ARC9 and ARCa-ARCT.</p> <p>The <code>LOG_ARCHIVE_MAX_PROCESSES</code> initialization parameter specifies the number of ARCn processes that the database initially invokes.</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i> and <i>Oracle Database Administrator's Guide</i></p> | Database instances                                                                                                     |
| ARSn | ASM Recovery Worker Process                   | Recovers ASM transactional operations                                                                | The ASM RBAL background process coordinates and spawns one or more of these worker processes to recover terminated ASM transactional operations. These processes run only in the Oracle ASM instance. Possible processes are ARS0-ARS9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Oracle ASM instances                                                                                                   |

| Name       | Expanded Name                            | Short Description                                                                                                                                                                                                                                       | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | External Properties                                                                                   |
|------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| ASMB, AMBn | ASM Background Process                   | Communicates with an Oracle ASM instance, managing storage and providing statistics                                                                                                                                                                     | <p>In a database instance, the ASMB and AMBn processes enable the database instance to connect to an Oracle ASM instance in order to access Oracle ASM disk groups. Possible processes are ASMB and AMB1-AMB3.</p> <p>In an Oracle ASM instance, the ASMB process runs when the ASMCMD cp command runs, or when a database instance first starts if the server parameter file is stored in Oracle ASM. ASMB also runs with Oracle Cluster Registry on Oracle ASM. The only possible process is ASMB; AMBn processes do not run in Oracle ASM instances.</p> <p>In an Oracle IO Server (IOS) instance, the ASMB process enables the IOS instance to connect to an Oracle ASM instance in order to access Oracle ASM disk groups. The only possible process is ASMB; AMBn processes do not run in IOS instances.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Database instances, Oracle ASM instances, Oracle IO Server (IOS) instances                            |
| ASnn       | Replication Apply Reader or Apply Server | <p>Computes dependencies between logical change records (LCRs) and assembles messages into transactions (Reader Server)</p> <p>Applies LCRs to database objects or passes LCRs and user messages to their appropriate apply handlers (Apply Server)</p> | <p>When the reader server finishes computing dependencies between LCRs and assembling transactions, it returns the assembled transactions to the coordinator process. Query V\$STREAMS_APPLY_READER, V\$XSTREAM_APPLY_READER, and V\$GG_APPLY_READER for information about the reader server background process.</p> <p>An apply server receives the transactions from the coordinator background process, and either applies database changes in LCRs or sends LCRs or messages to apply handlers. Apply servers can also enqueue a queue. If an apply server encounters an error, then it then tries to resolve the error with a user-specified conflict handler or error handler. If an apply server cannot resolve an error, then it rolls back the transaction and places the entire transaction, including all of its messages, in the error queue. When an apply server commits a completed transaction, this transaction has been applied. When an apply server places a transaction in the error queue and commits, this transaction also has been applied. Query V\$STREAMS_APPLY_SERVER for information about the apply server background process. For XStream Inbound servers, query V\$XSTREAM_APPLY_SERVER. For GoldenGate Integrated Replicat, query V\$GG_APPLY_SERVER.</p> <p>The coordinator process name is ASnn, where nn can include letters and numbers.</p> | Database instances, XStream Outbound servers, XStream Inbound servers, GoldenGate Integrated Replicat |

| Name | Expanded Name                                      | Short Description                                                                                                                   | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | External Properties                      |
|------|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| BMRn | Automatic Block Media Recovery Worker Pool Process | Fetches blocks from a real-time readable standby database                                                                           | <p>When a process submits a block media recovery request to ABMR, it dynamically spawns worker processes (BMRn) to perform the recovery. BMRn processes fetch blocks from a real-time readable standby database. ABMR and BMRn terminate after being idle for a long time.</p> <p><b>See Also:</b> <i>Oracle Database Backup and Recovery User's Guide</i></p>                                                                                                                                                                                         | Database instances                       |
| Bnnn | ASM Blocking Worker Process for GMON               | Performs maintenance actions on Oracle ASM disk groups                                                                              | <p>Bnnn performs actions that require waiting for resources on behalf of GMON. GMON must be highly available and cannot wait.</p> <p>A Bnnn worker is spawned when a disk is taken offline in an Oracle ASM disk group. Offline timer processing and drop of the disk are performed in this worker. Up to five process (B000 to B004) can exist depending on the load.</p>                                                                                                                                                                             | Oracle ASM instances                     |
| BWnn | Database Writer Process                            | Writes modified blocks from the database buffer cache to the data files                                                             | See the <b>Long Description</b> for the DBWn process in this table for more information about the BWnn process.                                                                                                                                                                                                                                                                                                                                                                                                                                        | Database instances                       |
| CJQ0 | Job Queue Coordinator Process                      | Selects jobs that need to be run from the data dictionary and spawns job queue worker processes (Jnnn) to run the jobs              | <p>CJQ0 is automatically started and stopped as needed by Oracle Scheduler.</p> <p>The <code>JOB_QUEUE_PROCESSES</code> initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. CJQ0 starts only as many job queue processes as required by the number of jobs to run and available resources.</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i> and <i>Oracle Database Administrator's Guide</i></p>                                                                                  | Database instances                       |
| CKPT | Checkpoint Process                                 | Signals DBWn at checkpoints and updates all the data files and control files of the database to indicate the most recent checkpoint | <p>At specific times CKPT starts a checkpoint request by messaging DBWn to begin writing dirty buffers. On completion of individual checkpoint requests, CKPT updates data file headers and control files to record most recent checkpoint.</p> <p>CKPT checks every three seconds to see whether the amount of memory exceeds the value of the <code>PGA_AGGREGATE_LIMIT</code> initialization parameter, and if so, takes the action described in "<a href="#">PGA_AGGREGATE_LIMIT</a>".</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i></p> | Database instances, Oracle ASM instances |
| CLnn | Cleanup Worker Process                             | Performs cleanup of terminated processes                                                                                            | Cleanup workers assist in the cleanup of terminated processes and terminated sessions. The number of workers will be proportional to the amount of cleanup work to be done and the current efficiency of cleanup.                                                                                                                                                                                                                                                                                                                                      | Database instances, Oracle ASM instances |
| CLG  | Persistent Cluster Flash Cache Background Process  | For Oracle Data Appliance only, this process performs actions related to recovery of a terminated instance's database flash cache   | For Oracle Data Appliance only, in the event of an instance crash, the running instance will recover the crashed instance's database flash cache. The CLG process will perform actions related to scanning the crashed instance's database flash cache and claim flash blocks mastered by the crashed instance.                                                                                                                                                                                                                                        | Database instances, Oracle RAC           |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                      | Short Description                                                                                                                                                                | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | External Properties                          |
|------|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| CLMN | Cleanup Main Process               | Performs cleanup of terminated processes, terminated sessions, terminated transactions, and terminated network connections                                                       | CLMN periodically performs cleanup of all the following: terminated processes, terminated sessions, transactions, network connections, idle sessions, detached transactions, and detached network connections that have exceeded their idle timeout.                                                                                                                                                                                                                                                                                                                                                                                               | Database instances, Oracle ASM instances     |
| CPnn | Replication Capture Process        | Captures database changes from the redo log by using the infrastructure of LogMiner                                                                                              | The capture process name is CPnn, where nn can include letters and numbers. The underlying LogMiner process name is MSnn, where nn can include letters and numbers. The capture process includes one reader server that reads the redo log and divides it into regions, one or more preparer servers that scan the redo log, and one builder server that merges redo records from the preparer servers. Each reader server, preparer server, and builder server is a process. Query the V\$XSTREAM_CAPTURE and V\$GOLDENGATE_CAPTURE views for information about this background process.<br><b>See Also:</b> <i>Oracle Database XStream Guide</i> | Database instances, XStream Outbound Servers |
| CRnn | LMS CR Worker Process              | Offloads the work from LMS so that blocks that require lots of UNDO to be applied do not block the LMS. Such requests are passed on to the worker so that the LMS is not stalled | There can be a maximum of eight CR processes per LMS process, with names from CR00 to CR07. Each LMS has its own set with similar name. The CRnn processes are threads and the process ID part will be the same as the owning LMS's process ID.<br>The names for CRnn processes will have the format CR0n_<spawning process id>_<thread id>.                                                                                                                                                                                                                                                                                                       | Oracle RAC                                   |
| CSnn | I/O Calibration Process            | Issues I/Os to storage as part of storage calibration.                                                                                                                           | CSnn worker processes are started on execution of the DBMS_RESOURCE_MANAGER.CALIBRATE_IO() procedure. There is one worker process per CPU on each node of the database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Database instances, Oracle RAC               |
| CTWR | Change Tracking Writer Process     | Tracks changed data blocks as part of the Recovery Manager block change tracking feature                                                                                         | CTWR tracks changed blocks as redo is generated at a primary database and as redo is applied at a standby database. The process is slightly different depending on the type of database.<br><b>See Also:</b> <i>Oracle Database Backup and Recovery User's Guide</i>                                                                                                                                                                                                                                                                                                                                                                               | Database instances                           |
| CXnn | Replication Capture Worker Process | Sends captured LCRs to a receiver, such as an XStream Outbound Server                                                                                                            | The capture worker process name is CXnn, where nn can include letters and numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Database instances, XStream Outbound Server  |
| DBRM | Database Resource Manager Process  | Sets resource plans and performs other tasks related to the Database Resource Manager                                                                                            | If a resource plan is not enabled, then this process is idle.<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Database instances                           |

|------|-------------------------------|-------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| DBWn | Database Writer Process       | Writes modified blocks from the database buffer cache to the data files                                     | <p>The primary responsibility of the Database Writer Process is to write data blocks to disk. It also handles checkpoints, file open synchronization, and logging of Block Written records.</p> <p>In many cases the blocks that the Database Writer Process writes are scattered throughout the disk. Thus, the writes tend to be slower than the sequential writes performed by LGWR. The Database Writer Process performs multiblock writes when possible to improve efficiency. The number of blocks written in a multiblock write varies by operating system.</p> <p>The <code>DB_WRITER_PROCESSES</code> initialization parameter specifies the number of Database Writer Processes. There can be 1 to 100 Database Writer Processes. The names of the first 36 Database Writer Processes are DBW0-DBW9 and DBWa-DBWz. The names of the 37th through 100th Database Writer Processes are BW36-BW99. The database selects an appropriate default setting for the <code>DB_WRITER_PROCESSES</code> parameter or adjusts a user-specified setting based on the number of CPUs and processor groups.</p> <p><b>See Also:</b> "<a href="#">DB_WRITER_PROCESSES</a>"</p> | Database instances                       |
| DIA0 | Diagnostic Process            | Detects and resolves hangs and deadlocks                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Database instances, Oracle ASM instances |
| DIAG | Diagnostic Capture Process    | Performs diagnostic dumps                                                                                   | DIAG performs diagnostic dumps requested by other processes and dumps triggered by process or instance termination. In Oracle RAC, DIAG performs global diagnostic dumps requested by remote instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Database instances, Oracle ASM instances |
| DMnn | Data Pump Control Job Process | Coordinates the Data Pump job tasks performed by Data Pump worker processes and handles client interactions | The Data Pump control job process is started during job creation and coordinates all tasks performed by the Data Pump job. It handles all client interactions and communication, establishes all job contexts, and coordinates all worker process activities on behalf of the job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Database instances, Data Pump            |

|------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| DMON | Data Guard Broker Monitor Process | Manages and monitors a database that is part of a Data Guard broker configuration                                                            | <p>When you start the Data Guard broker, a DMON process is created. DMON runs for every database instance that is managed by the broker. DMON interacts with the local database and the DMON processes of the other databases to perform the requested function. DMON also monitors the health of the broker configuration and ensures that every database has a consistent description of the configuration.</p> <p>DMON maintains profiles about all database objects in the broker configuration in a binary configuration file. A copy of this file is maintained by the DMON process for each of the databases that belong to the broker configuration. The process is created when the <code>DG_BROKER_START</code> initialization parameter is set to <code>true</code>.</p> <p><b>See Also:</b> <i>Oracle Data Guard Broker</i></p>                                                                                                                                                                                                                                                                   | Database instances, Data Guard     |
| Dnnn | Dispatcher Process                | Performs network communication in the shared server architecture                                                                             | <p>In the shared server architecture, clients connect to a dispatcher process, which creates a virtual circuit for each connection. When the client sends data to the server, the dispatcher receives the data into the virtual circuit and places the active circuit on the common queue to be picked up by an idle shared server. The shared server then reads the data from the virtual circuit and performs the database work necessary to complete the request. When the shared server must send data to the client, the server writes the data back into the virtual circuit and the dispatcher sends the data to the client. After the shared server completes the client request, the server releases the virtual circuit back to the dispatcher and is free to handle other clients.</p> <p>Several initialization parameters relate to shared servers. The principal parameters are: <code>DISPATCHERS</code>, <code>SHARED_SERVERS</code>, <code>MAX_SHARED_SERVERS</code>, <code>LOCAL_LISTENER</code>, <code>REMOTE_LISTENER</code>.</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i></p> | Database instances, shared servers |
| DSKM | Worker Diskmon Process            | Acts as the conduit between the database, Oracle ASM instances, and the Primary Diskmon daemon to communicate information to Exadata storage | This process is active only if Exadata Storage is used. DSKM performs operations related to Exadata I/O fencing and Exadata cell failure handling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Oracle ASM instances, Exadata      |
| DWnn | Data Pump Worker Process          | Performs Data Pump tasks as assigned by the Data Pump control job process                                                                    | The Data Pump worker process is responsible for performing tasks that are assigned by the Data Pump control job process, such as the loading and unloading of metadata and data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Database instances                 |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                                        | Short Description                                                                                                               | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | External Properties                                  |
|------|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| EMNC | EMON Coordinator Process                             | Coordinates database event management and notifications                                                                         | EMNC is a primary background process that coordinates event management and notification activity in the database, including Streams Event Notifications, Continuous Query Notifications, and Fast Application Notifications.                                                                                                                                                                                                                                                                                             | Database instances                                   |
| Ennn | EMON Worker Process                                  | Performs database event management and notifications                                                                            | The database event management and notification load is distributed among the EMON worker processes. These processes work on the system notifications in parallel, offering a capability to process a larger volume of notifications, a faster response time, and a lower shared memory use for staging notifications.                                                                                                                                                                                                    | Database instances                                   |
| FBDA | Flashback Data Archiver Process                      | Archives historical rows for tracked tables into flashback data archives and manages archive space, organization, and retention | When a transaction that modifies a tracked table commits, FBDA stores the pre-image of the rows in the archive. FBDA maintains metadata on the current rows and tracks how much data has been archived.<br><br>FBDA is also responsible for automatically managing the flashback data archive for space, organization (partitioning tablespaces), and retention. FBDA also keeps track of how far the archiving of tracked transactions has progressed.<br><br><b>See Also:</b> <i>Oracle Database Development Guide</i> | Database instances                                   |
| FDnn | Oracle ASM Stale FD Cleanup Worker Process           | Cleans up Oracle ASM stale file descriptors on foreground processes                                                             | This process cleans up Oracle ASM stale file descriptors on foreground processes if an Oracle ASM disk is globally closed.                                                                                                                                                                                                                                                                                                                                                                                               | Database and Oracle ASM instances                    |
| FENC | Fence Monitor Process                                | Processes fence requests for RDBMS instances which are using Oracle ASM instances                                               | CSS monitors RDBMS instances which are connected to the Oracle ASM instance and constantly doing I/Os. When the RDBMS instance terminates due to a failure, all the outstanding I/O's from the RDBMS instance should be drained and any new I/O's rejected. FENC receives and processes the fence request from CSSD.                                                                                                                                                                                                     | Oracle ASM instances                                 |
| FMON | File Mapping Monitor Process                         | Manages mapping information for the Oracle Database file mapping interface                                                      | The <code>DBMS_STORAGE_MAP</code> package enables you to control the mapping operations. When instructed by the user, FMON builds mapping information and stores it in the SGA, refreshes the information when a change occurs, saves the information to the data dictionary, and restores it to the SGA at instance startup.<br><br>FMON is started by the database whenever the <code>FILE_MAPPING</code> initialization parameter is set to <code>true</code> .                                                       | Database instances, Oracle ASM instances             |
| FSFP | Data Guard Broker Fast Start Failover Pinger Process | Maintains fast-start failover state between the primary and target standby databases                                            | FSFP is created when fast-start failover is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Database instances, Data Guard                       |
| GCRn | Global Conflict Resolution Worker Process            | Performs synchronous tasks on behalf of LMHB                                                                                    | GCRn processes are transient workers that are started and stopped as required by LMHB to perform synchronous or resource intensive tasks.                                                                                                                                                                                                                                                                                                                                                                                | Database instances, Oracle ASM instances, Oracle RAC |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                    | Short Description                                                                          | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | External Properties                                                                                 |

| GCWn | GCR Monitor processes (LMHB)     | GCR(DRF) monitor processes (LMHB)                                                          | Infrastructure helper processes for LMHB. Monitors the LMHB process for stalls, and restarts if necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Database instances, Oracle ASM instances, Oracle RAC instances (prior to Oracle Database 23ai only) |
| GEN0 | General Task Execution Process   | Performs required tasks including SQL and DML                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Database instances, Oracle ASM instances, Oracle ASM Proxy instances                                |
| GMON | ASM Disk Group Monitor Process   | Monitors all mounted Oracle ASM disk groups                                                | GMON monitors all the disk groups mounted in an Oracle ASM instance and is responsible for maintaining consistent disk membership and status information. Membership changes result from adding and dropping disks, whereas disk status changes result from taking disks offline or bringing them online.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Oracle ASM instances                                                                                |
| GTXn | Global Transaction Process       | Provides transparent support for XA global transactions in an Oracle RAC environment       | <p>These processes help maintain the global information about XA global transactions throughout the cluster. Also, the processes help perform two-phase commit for global transactions anywhere in the cluster so that an Oracle RAC database behaves as a single system to the externally coordinated distributed transactions.</p> <p>The GLOBAL_TXN_PROCESSES initialization parameter specifies the number of GTXn processes, where <i>n</i> is 0-9 or a-j. The database automatically tunes the number of these processes based on the workload of XA global transactions. You can disable these processes by setting the parameter to 0. If you try to run XA global transactions with these processes disabled, an error is returned.</p> <p><b>See Also:</b> <i>Oracle Real Application Clusters Administration and Deployment Guide</i></p> | Database instances, Oracle RAC                                                                      |
| Innn | Disk and Tape I/O Worker Process | Serves as an I/O worker process spawned on behalf of DBWR, LGWR, or an RMAN backup session | I/O worker process can be configured on platforms where asynchronous I/O support is not available. These workers are started by setting the corresponding worker enable parameter in the server parameter file. The I/O workers simulate the asynchronous I/O behavior when the underlying platform does not have native support for asynchronous I/O.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Database instances                                                                                  |

Table F-1 (Cont.) Background Processes

| Name        | Expanded Name                               | Short Description                                                                                                    | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | External Properties                                  |
|-------------|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| IMCO        | In-Memory Coordinator                       | Initiates background population and repopulation of in-memory enabled objects                                        | <p>The IMCO background process initiates population (prepopulation) of in-memory enabled objects with priority LOW/MEDIUM/HIGH/CRITICAL. In-memory enabled objects with priority NONE will not be prepopulated but will be populated on demand via <i>Wnnn</i> processes when queried. The IMCO background process can also initiate repopulation of in-memory objects.</p> <p>Starting with Oracle Database 19c, IMXT (In-Memory External Table) segments are dropped by the IMCO background process. In previous releases, IMXT segments were dropped by foreground processes.</p> | Database instances                                   |
| IMR0        | Instance Membership Recovery Worker Process | Performs synchronous tasks on behalf of LMON                                                                         | The IMR0 background process performs the Instance Member Recovery synchronous operations on behalf of LMON                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Oracle RAC, Database instances, Oracle ASM instances |
| INSV        | Data Guard Broker Instance Worker Process   | Performs Data Guard broker communication among instances in an Oracle RAC environment                                | INSV is created when the <code>DG_BROKER_START</code> initialization parameter is set to <code>true</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Database instances, Data Guard                       |
| IPC0        | IPC Service Background Process              | Common background server for basic messaging and RDMA primitives based on IPC (Inter-process communication) methods. | IPC0 handles very high rates of incoming connect requests, as well as, completing reconfigurations to support basic messaging and RDMA primitives over several transports such as UDP, RDS, InfiniBand and RC.                                                                                                                                                                                                                                                                                                                                                                       | Oracle RAC                                           |
| <i>Jnnn</i> | Job Queue Worker Process                    | Executes jobs assigned by the job coordinator                                                                        | <p>Job worker processes are created or awakened by the job coordinator when it is time for a job to be executed. Job workers gather all the metadata required to run the job from the data dictionary. The worker processes start a database session as the owner of the job, execute triggers, and then execute the job. After the job is complete, the worker processes commit and then execute appropriate triggers and close the session. The worker can repeat this operation in case additional jobs need to be run.</p>                                                       | Database instances                                   |
| <i>JPn</i>  | Java Patching Worker Process                | Patches and updates the Java in the database classes                                                                 | <i>JPn</i> patches and updates the Java in the database classes. It is only started for Oracle Real Application Clusters (Oracle RAC) databases, and one of the database instances is responsible for patching the Java in the database objects. For multitenant container databases (CDBs), the process updates each pluggable database (PDB) individually. <i>JPn</i> is started automatically and does not require user intervention.                                                                                                                                             | Oracle RAC                                           |
| <i>LCKn</i> | Lock Process                                | Manages global enqueue requests and cross-instance broadcasts                                                        | <p>The process handles all requests for resources other than data blocks. For examples, <i>LCKn</i> manages library and row cache requests.</p> <p>Possible processes are LCK0 and LCK1.</p>                                                                                                                                                                                                                                                                                                                                                                                         | Database instances, Oracle ASM instances, Oracle RAC |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                                          | Short Description                                                                                                         | Long Description                                                                                                                                                                                                                                                                                                                                                                                 | External Properties                                  |
|------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| LDDn | Global Enqueue Service Daemon Helper Worker            | Helps the LMDn processes with various tasks                                                                               | LDDn processes are worker processes spawned on demand by LMDn processes. They are spawned to help the dedicated LMDn processes with various tasks when certain workloads start creating performance bottlenecks. These worker processes are transient as they are started on demand and they can be shutdown when no longer needed. There can be up to 36 of these worker processes (LDD0-LDDz). | Database instances, Oracle ASM instances, Oracle RAC |
| LGnn | Log Writer Worker                                      | Writes redo log                                                                                                           | On multiprocessor systems, LGWR creates worker processes to improve the performance of writing to the redo log. LGWR workers are not used when there is a SYNC standby destination.<br><br>Possible processes are LG00-LG99.                                                                                                                                                                     | Database instances                                   |
| LGWR | Log Writer Process                                     | Writes redo entries to the online redo log                                                                                | Redo log entries are generated in the redo log buffer of the system global area (SGA). LGWR writes the redo log entries sequentially into a redo log file. If the database has a multiplexed redo log, then LGWR writes the redo log entries to a group of redo log files.<br><br><b>See Also:</b> <i>Oracle Database Concepts</i> and <i>Oracle Database Administrator's Guide</i>              | Database instances, Oracle ASM instances             |
| LMnn | <b>See</b> <a href="#">LMSn</a> , <a href="#">LMnn</a> |                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                  |                                                      |
| LMDn | Global Enqueue Service Daemon Process                  | Manages incoming remote resource requests from other instances                                                            | LMDn processes enqueue resources managed under Global Enqueue Service. In particular, they process incoming enqueue request messages and control access to global enqueues. They also perform distributed deadlock detections. There can be up to 36 of these processes (LMD0-LMDz).                                                                                                             | Database instances, Oracle ASM instances, Oracle RAC |
| LMFC | Lock Manager Flash Cache Process                       | For Oracle Database Appliance only, performs actions related to recovery of a terminated instance's database flash cache. | For Oracle Database Appliance only, in the event of a instance crash, the running instance will recover the crashed instance's database flash cache. The LMFC process will perform actions related to scanning the crashed instance's database flash cache and claim flash blocks mastered by the crashed instance.                                                                              | Database instances, Oracle RAC                       |
| LMHB | Global Cache/ Enqueue Service Heartbeat Monitor        | Monitor the heartbeat of several processes                                                                                | LMHB monitors the CKPT, DIAn, LCKn, LGnn, LGWR, LMDn, LMON, LMSn, and RMSn processes to ensure they are running normally without blocking or spinning.                                                                                                                                                                                                                                           | Database instances, Oracle ASM instances, Oracle RAC |
| LMON | Global Enqueue Service Monitor Process                 | Monitors an Oracle RAC cluster to manage global resources                                                                 | LMON maintains instance membership within Oracle RAC. The process detects instance transitions and performs reconfiguration of GES and GCS resources.<br><br><b>See Also:</b> <i>Oracle Real Application Clusters Administration and Deployment Guide</i>                                                                                                                                        | Database instances, Oracle ASM instances, Oracle RAC |

| Name          | Expanded Name                            | Short Description                                                          | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | External Properties                                      |
|---------------|------------------------------------------|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| LMSn,<br>LMnn | Global Cache Service Process             | Manages resources and provides resource control among Oracle RAC instances | <p>LMSn and LMnn processes maintain a lock database for Global Cache Service (GCS) and buffer cache resources. These processes receive, process, and send GCS requests, block transfers, and other GCS-related messages. There can be up to 100 of these processes, named as follows:</p> <p>LMS0-LMS9<br/>LMSA-LMSZ<br/>LM10-LM19<br/>LM1A-LM1Z<br/>LM20-LM29<br/>LM2A-LM2R</p> <p><b>See Also:</b> <i>Oracle Real Application Clusters Administration and Deployment Guide</i></p>                                                                                    | Database instances, Oracle ASM instances, Oracle RAC     |
| LREG          | Listener Registration Process            | Registers the instance with the listeners                                  | LREG notifies the listeners about instances, services, handlers, and endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Database instances, Oracle ASM instances, Oracle RAC     |
| LSP0          | Logical Standby Coordinator Process      | Schedules transactions for Data Guard SQL Apply                            | LSP0 is the initial process created upon startup of Data Guard SQL Apply. In addition to managing LogMiner and Apply processes, LSP0 is responsible for maintaining inter-transaction dependencies and appropriately scheduling transactions with applier processes. LSP0 is also responsible for detecting and enabling run-time parameter changes for the SQL Apply product as a whole.                                                                                                                                                                               | Database instances, Data Guard                           |
| LSP1          | Logical Standby Dictionary Build Process | Performs a logical standby dictionary build on a primary database          | The LSP1 process is spawned on a logical standby database that is intended to become the new primary database. A logical standby database becomes a primary database because of switchover or failover. The dictionary is necessary for logical standby databases to interpret the redo of the new primary database.                                                                                                                                                                                                                                                    | Database instances, Data Guard                           |
| LSP2          | Logical Standby Set Guard Process        | Determines which database objects will be protected by the database guard  | The LSP2 process is created as needed during startup of SQL Apply to update the list of objects that are protected by the database guard.                                                                                                                                                                                                                                                                                                                                                                                                                               | Database instances, Data Guard                           |
| Lnnn          | Pooled Server Process                    | Handles client requests in Database Resident Connection Pooling            | <p>In Database Resident Connection Pooling, clients connect to a connection broker process. When a connection becomes active, the connection broker hands off the connection to a compatible pooled server process. The pooled server process performs network communication directly on the client connection and processes requests until the client releases the server. After being released, the connection is returned to the broker for monitoring, leaving the server free to handle other clients.</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i></p> | Database instances, Database Resident Connection Pooling |

| Name | Expanded Name                                     | Short Description                                                                                           | Long Description                                                                                                                                                                                                                                                                                                                                                                              | External Properties                                                              |
|------|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| MARK | Mark AU for Resynchronization Coordinator Process | Marks ASM allocation units as stale following a missed write to an offline disk                             | MARK essentially tracks which extents require resynchronization for offline disks. This process runs in the database instance and is started when the database instance first begins using the Oracle ASM instance. If required, MARK can also be started on demand when disks go offline in the Oracle ASM redundancy disk group.                                                            | Database instances, Oracle ASM instances                                         |
| MMAN | Memory Manager Process                            | Serves as the instance memory manager                                                                       | This process performs the resizing of memory components on the instance.                                                                                                                                                                                                                                                                                                                      | Database instances, Oracle ASM instances                                         |
| MMNL | Manageability Monitor Lite Process                | Performs tasks relating to manageability, including active session history sampling and metrics computation | MMNL performs many tasks relating to manageability, including session history capture and metrics computation.                                                                                                                                                                                                                                                                                | Database instances, Oracle ASM instances                                         |
| MMON | Manageability Monitor Process                     | Performs or schedules many manageability tasks                                                              | MMON performs many tasks related to manageability, including taking Automatic Workload Repository snapshots and performing Automatic Database Diagnostic Monitor analysis.                                                                                                                                                                                                                    | Database instances, Oracle ASM instances                                         |
| Mnnn | Shared MMON Worker Process                        | Performs manageability tasks on behalf of MMON                                                              | The <i>Mnnn</i> processes are a pool of worker processes that can be shared by multiple <i>MZnn</i> processes.<br><br>See the <b>Long Description</b> for <i>MZnn</i> in this table for more information about the <i>MZnn</i> processes.                                                                                                                                                     | Database instances, Oracle ASM instances                                         |
| MRP0 | Managed Standby Recovery Process                  | Coordinates the application of redo on a physical standby database                                          | MRP0 is spawned at the start of redo apply on a physical standby database. This process handles the extraction of redo and coordinates the application of that redo on a physical standby database.<br><br><b>See Also:</b> <i>Oracle Data Guard Concepts and Administration</i>                                                                                                              | Database instances, Data Guard                                                   |
| MSnn | LogMiner Worker Process                           | Reads redo log files and translates and assembles into transactions                                         | Multiple <i>MSnn</i> processes can exist, where <i>n</i> is 0-9 or a-Z. A minimum of three <i>MSnn</i> processes work as a group to provide transactions to a LogMiner client, for example, a logical standby database or a database capture. There may be more than one such group, for example, multiple capture processes configured for either local or downstream capture in a database. | Database instances, Logical Standby, XStream Outbound servers, Oracle GoldenGate |
| MZnn | Dedicated MMON Worker Process                     | Performs manageability tasks on behalf of MMON                                                              | <i>MZnn</i> is a dedicated process for a single MMON worker action. It performs manageability tasks dispatched by MMON, which include taking Automatic Workload Repository snapshots and performing Automatic Database Diagnostic Monitor analysis.                                                                                                                                           | Database instances, Oracle ASM instances                                         |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                                | Short Description                                                                                         | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | External Properties                                      |
|------|----------------------------------------------|-----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Nnnn | Connection Broker Process                    | Monitors idle connections and hands off active connections in Database Resident Connection Pooling        | In Database Resident Connection Pooling, clients connect to a connection broker process. When a connection becomes active, the connection broker hands off the connection to a compatible pooled server process. The pooled server process performs network communication directly on the client connection and processes requests until the client releases the server. After being released, the connection is returned to the broker for monitoring, leaving the server free to handle other clients.<br><br><b>See Also:</b> <i>Oracle Database Concepts</i> | Database instances, Database Resident Connection Pooling |
| NFSn | Direct NFS Dispatcher IO Worker Process      | Performs direct NFS I/O for database processes                                                            | The dispatcher worker processes enable scaling of Direct NFS connections to a clustered NAS storage. These dedicated set of workers will be used to perform Direct NFS I/Os on behalf of database processes. The dispatcher processes are enabled by the <code>ENABLE_DNFS_DISPATCHER</code> initialization parameter. NFSn is spawned only if Direct NFS library is enabled for I/O to NFS servers. The number of worker processes spawned is based on the <code>CPU_COUNT</code> value.<br><br><b>See Also:</b> <a href="#">"ENABLE_DNFS_DISPATCHER"</a>       | Database instances                                       |
| NSSn | Network Server SYNC Process                  | Transfers redo from current online redo logs to remote standby destinations configured for SYNC transport | NSSn can run as multiple processes, where <i>n</i> is 1-9 or A.<br><br><b>See Also:</b> <i>Oracle Data Guard Concepts and Administration</i>                                                                                                                                                                                                                                                                                                                                                                                                                     | Database instances, Data Guard                           |
| NSVn | Data Guard Broker NetSlave Process           | Performs broker network communications between databases in a Data Guard environment                      | NSVn is created when a Data Guard broker configuration is enabled. There can be as many NSVn processes (where <i>n</i> is 0- 9 and A-U) created as there are databases in the Data Guard broker configuration.                                                                                                                                                                                                                                                                                                                                                   | Database instances, Data Guard                           |
| OCFn | ASM CF Connection Pool Process               | Maintains a connection to the Oracle ASM instance for metadata operations                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Database instances, Oracle ASM instances                 |
| OFSD | Oracle File Server Background Process        | Serves file system requests submitted to an Oracle instance                                               | This background process listens for new file system requests, both management (like mount, unmount, and export) and I/O requests, and executes them using Oracle threads.                                                                                                                                                                                                                                                                                                                                                                                        | Database instances, Oracle RAC                           |
| OFnn | Oracle File Server Background Process Thread | Serves file system requests submitted to an Oracle instance                                               | This is a thread for the OFSD background process<br>This background process thread is available only on Linux systems.                                                                                                                                                                                                                                                                                                                                                                                                                                           | Database instances, Oracle RAC                           |
| Onnn | ASM Connection Pool Process                  | Maintains a connection to the Oracle ASM instance for metadata operations                                 | Onnn worker processes are spawned on demand. These processes communicate with the Oracle ASM instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Database instances, Oracle ASM instances                 |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                            | Short Description                                                                                                           | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | External Properties                                                  |
|------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| PING | Interconnect Latency Measurement Process | Assesses latencies associated with communications for each pair of cluster instances                                        | Every few seconds, the process in one instance sends messages to each instance. The message is received by PING on the target instance. The time for the round trip is measured and collected.                                                                                                                                                                                                                                                                                                                                                                                                                                   | Database instances, Oracle ASM instances, Oracle RAC                 |
| PMAN | Process Manager                          | Manages several background processes including shared servers, pooled servers, and job queue processes                      | PMAN monitors, spawns, and stops the following as needed: <ul style="list-style-type: none"> <li>• dispatcher and shared server processes</li> <li>• connection broker and pooled server processes for database resident connection pools</li> <li>• job queue processes</li> <li>• restartable background processes</li> </ul>                                                                                                                                                                                                                                                                                                  | Database instances, Oracle ASM instances, Oracle ASM Proxy instances |
| PMON | Process Monitor                          | Scans for terminated processes and coordinates cleanup                                                                      | PMON periodically scans all processes to find any that have died in a nonstandard way. PMON is then responsible for coordinating cleanup performed by the CLMN process and the CLnn workers.<br><b>See Also:</b> <i>Oracle Database Concepts</i> and <i>Oracle Database Net Services Administrator's Guide</i>                                                                                                                                                                                                                                                                                                                   | Database instances, Oracle ASM instances, Oracle ASM Proxy instances |
| Pnnn | Parallel Query Worker Process            | Perform parallel execution of a SQL statement (query, DML, or DDL)                                                          | Parallel Query has two components: a foreground process that acts as query coordinator and a set of parallel workers (Pnnn) that are background processes. These background processes are spawned or reused during the start of a parallel statement. They receive and perform units of work sent from the query coordinator.<br><br>The maximum number of Pnnn processes is controlled by the initialization parameter PARALLEL_MAX_SERVERS. Worker processes are numbered from 0 to the PARALLEL_MAX_SERVERS setting. If the query is a GV\$ query, then these background processes are numbered backward, starting from PPA7. | Database instances, Oracle ASM instances                             |
| PRnn | Parallel Recovery Process                | Performs tasks assigned by the coordinator process performing parallel recovery                                             | PRnn serves as a worker process for the coordinator process performing parallel media recovery and carries out tasks assigned by the coordinator. The default number of these processes is based on number of CPUs.                                                                                                                                                                                                                                                                                                                                                                                                              | Database instances                                                   |
| PSP0 | Process Spawner Process                  | Spawns Oracle background processes after initial instance startup                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Database instances, Oracle ASM instances                             |
| PXMN | Parallel Execution Monitor               | Spawns parallel server processes on local instances in an Oracle RAC environment for Query Coordinator in remote instances. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Database instances                                                   |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                     | Short Description                                                                                                   | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | External Properties                         |
|------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| QMNC | Non-sharded queue primary process | Monitors AQ                                                                                                         | QMNC is the non-sharded queue primary process responsible for facilitating various background activities required by AQ: time management of messages, management of nonpersistent queues, cleanup of resources, and so on. QMNC dynamically spawns <i>Qnnn</i> processes as needed for performing these tasks.<br><br>Note that if the <code>AQ_TM_PROCESSES</code> initialization parameter is set to 0, this process will not start. The database writes the following message to the alert log:<br>WARNING: AQ_TM_PROCESSES is set to 0.<br>System might be adversely affected. | Database instances<br>Advanced Queueing     |
| QMnn | AQ Primary Class Process          | Per instance per AQ Primary Class Process                                                                           | Each of this type of process represents a single class of work item such as AQ notification, queue monitors, and cross process.                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Database instances<br>Advanced Queueing     |
| Qnnn | AQ Server Class Process           | Per AQ Primary Class server process                                                                                 | Each server class process acts on behalf of an AQ primary class process. This relationship is maintained until the primary requires services of a particular service process. Once released, the server class processes are moved to a free server pool.                                                                                                                                                                                                                                                                                                                           | Database instances<br>Advanced Queueing     |
| Rnnn | ASM Block Remap Worker Process    | Remaps a block with a read error                                                                                    | A database instance reading from an Oracle ASM disk group can encounter an error during a read. If possible, Oracle ASM asynchronously schedules a <i>Rnnn</i> worker process to remap this bad block from a mirror copy.                                                                                                                                                                                                                                                                                                                                                          | Oracle ASM instances                        |
| RBAL | ASM Rebalance Primary Process     | Coordinates rebalance activity                                                                                      | In an Oracle ASM instance, it coordinates rebalance activity for disk groups. In a database instance, it manages Oracle ASM disk groups.                                                                                                                                                                                                                                                                                                                                                                                                                                           | Database instances,<br>Oracle ASM instances |
| RCBG | Result Cache Background Process   | Handles result cache messages                                                                                       | This process is used for handling invalidation and other messages generated by server processes attached to other instances in Oracle RAC.                                                                                                                                                                                                                                                                                                                                                                                                                                         | Database instances,<br>Oracle RAC           |
| RECO | Recoverer Process                 | Resolves distributed transactions that are pending because of a network or system failure in a distributed database | RECO uses the information in the pending transaction table to finalize the status of in-doubt transactions. At timed intervals, the local RECO attempts to connect to remote databases and automatically complete the commit or rollback of the local portion of any pending distributed transactions. All transactions automatically resolved by RECO are removed from the pending transaction table.<br><br><b>See Also:</b> <i>Oracle Database Concepts</i> and <i>Oracle Database Net Services Administrator's Guide</i>                                                       | Database instances                          |
| RLnn | ResetLogs Process                 | Clear online redo logs when performing open resetlogs and converting to physical standby                            | RLnn processes are spawned to clear online redo logs. These workers are terminated after the online redo logs are cleared, and the session does not persist.<br>Possible processes are RL00-RL31.                                                                                                                                                                                                                                                                                                                                                                                  | Database instances                          |
| RM   | RAT Masking Worker Process        | Extracts and masks bind values from workloads like SQL tuning sets and DB Replay capture files                      | This background process is used with Data Masking and Real Application Testing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Database instances                          |

Table F-1 (Cont.) Background Processes

|------|---------------------------------------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| RMON | Rolling Migration Monitor Process     | Manages the rolling migration procedure for an Oracle ASM cluster                               | The RMON process is spawned on demand to run the protocol for transitioning an ASM cluster in and out of rolling migration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Oracle ASM instance, Oracle RAC |
| RMSn | Oracle RAC Management Process         | Performs manageability tasks for Oracle RAC                                                     | RMSn performs a variety of tasks, including creating resources related to Oracle RAC when new instances are added to a cluster.<br><br><b>See Also:</b> <i>Oracle Real Application Clusters Administration and Deployment Guide</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Database instances, Oracle RAC  |
| RPnn | Capture Processing Worker Process     | Processes a set of workload capture files                                                       | RPnn are worker processes spawned by calling <code>DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE(capture_dir, parallel_level)</code> . Each worker process is assigned a set of workload capture files to process.<br><br>Worker processes execute in parallel without needing to communicate with each other. After each process is finished processing its assigned files, it exits and informs its parent process.<br><br>The number of worker processes is controlled by the <code>parallel_level</code> parameter of <code>DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE</code> . By default, <code>parallel_level</code> is null. Then, the number of worker processes is computed as follows:<br><br><pre>SELECT VALUE FROM   V\$PARAMETER WHERE  NAME='cpu_count';</pre><br>When <code>parallel_level</code> is 1, no worker processes are spawned. | Database instances              |
| RPOP | Instant Recovery Repopulation Daemon  | Responsible for re-creating and/or repopulating data files from snapshot files and backup files | The RPOP process is responsible for re-creating and repopulating data files from snapshots files. It works with the instant recovery feature to ensure immediate data file access. The local instance has immediate access to the remote snapshot file's data, while repopulation of the recovered primary data files happens concurrently. Any changes in the data are managed between the instance's DBW processes and RPOP to ensure the latest copy of the data is returned to the user.                                                                                                                                                                                                                                                                                                                                              | Database instances              |
| RSnn | Global Cache Service Remaster Process | Performs remastering for cluster reconfiguration and dynamic remastering                        | Each RSnn process is a worker process for LMSn to handle remastering work. They are also helper processes for LMS to handle non-critical work from global cache service.<br><br>The RSnn processes were named RMVn in Oracle Database 12c and earlier releases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Database instances, Oracle RAC  |
| RSM0 | Data Guard Broker Worker Process      | Performs monitoring management tasks related to Data Guard on behalf of DMON                    | The process is created when a Data Guard broker configuration is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Database instances, Data Guard  |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                                   | Short Description                                                                                      | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | External Properties                    |

| RSMN | Remote Worker Monitor Process                   | Manages background worker process creation and communication on remote instances in Oracle RAC         | This background process manages the creation of worker processes and the communication with their coordinators and peers. These background worker processes perform tasks on behalf of a coordinating process running in another cluster instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Database instances, Oracle RAC         |
| RVWR | Recovery Writer Process                         | Writes flashback data to the flashback logs in the fast recovery area                                  | RVWR writes flashback data from the flashback buffer in the SGA to the flashback logs. RVWR also creates flashback logs and performs some tasks for flashback log automatic management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Database instances, Flashback Database |
| Snnn | Shared Server Process                           | Handles client requests in the shared server architecture                                              | <p>In the shared server architecture, clients connect to a dispatcher process, which creates a virtual circuit for each connection. When the client sends data to the server, the dispatcher receives the data into the virtual circuit and places the active circuit on the common queue to be picked up by an idle shared server. The shared server then reads the data from the virtual circuit and performs the database work necessary to complete the request. When the shared server must send data to the client, the server writes the data back into the virtual circuit and the dispatcher sends the data to the client. After the shared server completes the client request, the server releases the virtual circuit back to the dispatcher and is free to handle other clients.</p> <p>Several initialization parameters relate to shared servers. The principal parameters are: <code>DISPATCHERS</code>, <code>SHARED_SERVERS</code>, <code>MAX_SHARED_SERVERS</code>, <code>LOCAL_LISTENER</code>, <code>REMOTE_LISTENER</code>.</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i></p> | Database instances, shared servers     |
| SAnn | SGA Allocator                                   | Allocates SGA                                                                                          | <p>A small fraction of SGA is allocated during instance startup. The SAnn process allocates the rest of SGA in small chunks. The process exits upon completion of SGA allocation.</p> <p>Possible processes are SA00-SAzz.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Database instances                     |
| SCCn | ASM Disk Scrubbing Worker Check Process         | Performs Oracle ASM disk scrubbing check operation                                                     | <p>SCCn acts as a worker process for SCRB and performs the checking operations.</p> <p>Possible processes are SCC0-SCC9.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Oracle ASM instances                   |
| SCM0 | DLM Statistics Collection and Management Worker | Collects and manages statistics related to global enqueue service (GES) and global cache service (GCS) | The DLM Statistics Collection and Management worker (SCM0) is responsible for collecting and managing the statistics related to global enqueue service (GES) and global cache service (GCS). This worker exists only if DLM statistics collection is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Database instances                     |
| SCMN | Statistics Collection and Management            | Main thread for a multithreaded process in a threaded Oracle RAC architecture                          | All other threads are spawned within the processes through SCMN, based on the requests in the instance. SCMN is an idle main thread, which waits for any requests, especially spawn threads, and takes care of them, along with performing periodic maintenance operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Oracle RAC                             |

| SCRB    | ASM Disk Scrubbing Primary Process       | Coordinates Oracle ASM disk scrubbing operations                                                                                                                                                          | SCRB runs in an Oracle ASM instance and coordinates Oracle ASM disk scrubbing operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Oracle ASM instances |
| SCR $n$ | ASM Disk Scrubbing Worker Repair Process | Performs Oracle ASM disk scrubbing repair operation                                                                                                                                                       | SCR $n$ acts as a worker process for SCRB and performs the repairing operations.<br>Possible processes are SCR0-SCR9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Oracle ASM instances |
| SCV $n$ | ASM Disk Scrubbing Worker Verify Process | Performs Oracle ASM disk scrubbing verify operation                                                                                                                                                       | SCV $n$ acts as a worker process for SCRB and performs the verifying operations.<br>Possible processes are SCV0-SCV9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Oracle ASM instances |
| SMCO    | Space Management Coordinator Process     | Coordinates the execution of various space management tasks                                                                                                                                               | This background process coordinates the execution of various space management tasks, including proactive space allocation and space reclamation. SMCO dynamically spawns worker processes ( <i>Wnnn</i> ) to implement these tasks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Database instances   |
| SMON    | System Monitor Process                   | Performs critical tasks such as instance recovery and terminated transaction recovery, and maintenance tasks such as temporary space reclamation, data dictionary cleanup, and undo tablespace management | <p>SMON performs many database maintenance tasks, including the following:</p> <ul style="list-style-type: none"> <li>Reclaims space used by orphaned temporary segments</li> <li>Maintains the undo tablespace by onlineing, offlineing, and shrinking the undo segments based on undo space usage statistics</li> <li>Cleans up the data dictionary when it is in a transient and inconsistent state</li> <li>Maintains the SCN to time mapping table used to support Oracle Flashback features</li> </ul> <p>In an Oracle RAC database, the SMON process of one instance can perform instance recovery for other instances that have failed.</p> <p>SMON is resilient to internal and external errors raised during background activities.</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i></p> | Database instances   |
| SP      | SPA Exec Worker                          | Analyzes single SQL statements sent from SQL Performance Analyzer (SPA)                                                                                                                                   | Executions of SPA tasks created from a SQL tuning set use this worker to analyze the SQL statements of the SQL tuning set concurrently.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Database instances   |
| SVCB    | Service Background Process               | Provides database service run-time load balancing and topology information to clients.                                                                                                                    | Every 30 seconds the process processes and publishes run-time load-balancing information and keeps the topology information current. This process is started only if Oracle Real Application Clusters (Oracle RAC) is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Oracle RAC           |
| TEM $n$ | ASM disk Test Error Emulation Process    | Emulates I/O errors on Oracle ASM disks through named events                                                                                                                                              | I/O errors can be emulated on Oracle ASM disk I/O through named events. The scope can be the process, instance, or even cluster. Optionally, a set of AUs can be chosen for error emulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Oracle ASM instances |

| TTnn | Redo Transport Worker Process                  | Ships redo from current online and standby redo logs to remote standby destinations configured for ASYNC transport | TTnn can run as multiple processes, where nn is 00 to ZZ.<br><b>See Also:</b> <i>Oracle Data Guard Concepts and Administration</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Database instances, Data Guard                   |
| Unnn | Container process for threads                  | Host processes where database processes execute as threads.                                                        | Unnn processes are database container operating system processes where database background processes like SMON, CJQ0, and database foreground processes run. The V\$PROCESS view lists database processes running in these container processes. These container processes are created only when the <code>THREADED_EXECUTION</code> initialization parameter is set to <code>TRUE</code> . The number of these processes vary depending on the active database processes. On a host with multiple NUMA nodes, there will be at least one Unnn process per NUMA node.<br><br>These processes are irrecoverable processes; if any of them is terminated, it will result in instance termination. These processes exit when the instance is shut down or terminated. | Database instances                               |
| VBGn | Volume Background Process                      | Communicates between the Oracle ASM instance and the operating system volume driver                                | VBGn handles messages originating from the volume driver in the operating system and sends them to the Oracle ASM instance.<br><br>VBGn can run as multiple processes, where n is 0-9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Oracle ASM instances, Oracle ASM Proxy instances |
| VDBG | Volume Driver Process                          | Forwards Oracle ASM requests to perform various volume-related tasks                                               | VDBG handles requests to lock or unlock an extent for rebalancing, volume resize, disk offline, add or drop a disk, force and dismount disk group to the Dynamic Volume Manager driver.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Oracle ASM instances, Oracle ASM Proxy instances |
| VInn | Volume I/O                                     | Route ADVN volume I/O for ASM instances on compute nodes within an Exadata                                         | These processes handle requests for I/Os targeted at storage not locally accessible. They are used for Exadata targeted storage as well. These background processes only start when an ASM Volume is created and set up to be used. One process will start for each NUMA node on target machines. Under normal operation on non-Exadata hardware and on Exadata hardware that is not utilizing ASM volumes, these processes will not be started.<br><br>There can be up to 32 VI processes, and they are named sequentially from VI00 to VI31.                                                                                                                                                                                                                    | Oracle ASM Proxy instances                       |
| VKRM | Virtual Scheduler for Resource Manager Process | Serves as centralized scheduler for Resource Manager activity                                                      | VKRM manages the CPU scheduling for all managed Oracle processes. The process schedules managed processes in accordance with an active resource plan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Database instances                               |
| VKTM | Virtual Keeper of Time Process                 | Provides a wall clock time and reference time for time interval measurements                                       | VKTM acts as a time publisher for an Oracle instance. VKTM publishes two sets of time: a wall clock time using a seconds interval and a higher resolution time (which is not wall clock time) for interval measurements. The VKTM timer service centralizes time tracking and offloads multiple timer calls from other clients.                                                                                                                                                                                                                                                                                                                                                                                                                                   | Database instances, Oracle ASM instances         |

| VMB0 | Volume Membership Process         | Maintains cluster membership on behalf of the Oracle ASM volume driver                                         | This process membership in the cluster as an I/O-capable client on behalf of the Oracle ASM volume driver.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Oracle ASM instances, Oracle ASM Proxy instances     |
| VOSD | Virtual Operating System Daemon   | Executes time-bound Oracle database service actions                                                            | This process is spawned on instance startup and is responsible for executing system service actions critical for the database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Database instances, Oracle ASM instances, Oracle RAC |
| VUBG | Volume drive Umbilicus Background | Relays messages between Oracle ASM instance and Oracle ASM Proxy instance that is used by ADVN (for ACFS)      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Oracle ASM instances, Oracle ASM Proxy instances     |
| Wnnn | Space Management Worker Process   | Performs various background space management tasks, including proactive space allocation and space reclamation | <p><i>Wnnn</i> worker processes perform work on behalf of Space Management and on behalf of the Oracle Database In-Memory option.</p> <ul style="list-style-type: none"> <li>When performing work on behalf of Space Management, <i>Wnnn</i> processes are worker processes dynamically spawned by SMCO to perform space management tasks in the background. These tasks include preallocating space into locally managed tablespace and SecureFiles segments based on space usage growth analysis, and reclaiming space from dropped segments. After being started, the worker acts as an autonomous agent. After it finishes task execution, it automatically picks up another task from the queue. The process terminates itself after being idle for a long time.</li> <li>When performing work on behalf of the Oracle Database In-Memory option, <i>Wnnn</i> processes execute tasks for population or repopulation of objects that are enabled for the In-Memory column store (IM columns store), and tasks that drop in-memory segments when an object is disabled for the IM columns store.</li> </ul> <p>For in-memory population and repopulation, both the IMCO background process and foreground processes will utilize <i>Wnnn</i> workers. <i>Wnnn</i> processes are utilized by the IMCO background process for prepopulation of in-memory enabled objects with priority LOW/MEDIUM/HIGH/CRITICAL, and for repopulation of in-memory objects. In-memory populate and repopulate tasks running on <i>Wnnn</i> workers are also initiated from foreground processes in response to queries and DMLs that reference in-memory enabled objects.</p> | Database instances                                   |

| XDMG        | Exadata Automation Manager    | Initiates automation tasks involved in managing Exadata storage | XDMG monitors all configured Exadata cells for state changes, such as a bad disk getting replaced, and performs the required tasks for such events. Its primary tasks are to watch for when inaccessible disks and cells become accessible again, and to initiate the ASM ONLINE operation. The ONLINE operation is handled by XDWK. | Oracle ASM instances, Exadata |
| XDWK        | Exadata Automation Manager    | Performs automation tasks requested by XDMG                     | XDWK gets started when asynchronous actions such as ONLINE, DROP, and ADD an Oracle ASM disk are requested by XDMG. After a 5 minute period of inactivity, this process will shut itself down.                                                                                                                                       | Oracle ASM instances, Exadata |
| <i>Xnnn</i> | ASM Disk Expel Worker Process | Performs Oracle ASM post-rebalance activities                   | This process expels dropped disks after an Oracle ASM rebalance.                                                                                                                                                                                                                                                                     | Oracle ASM instances          |
