Primary Author: Mary Beth Roeser

Contributing Authors: Sarika Surampudi

Contributors: Nipun Agarwal, Nigel Bayliss, Neerja Bhatt, Wilson Chan, Sumanta Chatterjee, Eugene Chong, Thuvan Hoang, Mark Johnson, Jonathan Klein, Sushil Kumar, Tirthankar Lahiri, Bill Lee, Yunrui Li, Juan Loaiza, Rich Long, Catherine Luu, Neil MacNaughton, Gopal Mulagund, Kant Patel, Mark Ramacher, Suvendu Ray, Debbie Steiner, Malai Stalin, Seema Sundara, Murali Thiagarajah, Alex Tsukerman, Kothanda Umamageswaran, Steve Vivian, Eric Voss, Tak Wang, Steve Wertheimer, Andy Witkowski, Daniel Wong, Qin Yu, Mohamed Ziauddin

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

1 Changes in This Release for Oracle Database Reference

1.1 Changes in Oracle Database 23ai, Release Update 23.6	1-1
1.2 Changes in Oracle Database 23ai	1-1
1.2.1 New Features	1-1
1.2.2 Deprecated Features	1-7
1.2.3 Desupported Features	1-7

Part I Initialization Parameters

2 Initialization Parameters

2.1 Uses of Initialization Parameters	2-1
2.1.1 Types of Initialization Parameters	2-2
2.1.1.1 Derived Parameters	2-2
2.1.1.2 Operating System-Dependent Parameters	2-2
2.1.1.3 Variable Parameters	2-2
2.2 Basic Initialization Parameters	2-3
2.3 Parameter Files	2-3
2.3.1 Server Parameter Files	2-3
2.3.2 Initialization Parameter Files	2-4
2.3.2.1 About the Character Set of Parameter Values	2-4
2.3.2.2 Specifying Values in an Initialization Parameter File	2-5
2.4 Changing Parameter Values in a Parameter File	2-9
2.4.1 Parameters by Functional Category	2-9
2.4.2 Modifiable Parameters	2-18

2.4.3	Displaying Current Parameter Values	2-27
2.4.4	Parameters You Should Not Specify in the Parameter File	2-28
2.4.5	When Parameters Are Set Incorrectly	2-28
2.5	Reading the Parameter Descriptions	2-28
2.6	Initialization Parameter Descriptions	2-29
2.7	ACTIVE_INSTANCE_COUNT	2-30
2.8	ADG_ACCOUNT_INFO_TRACKING	2-31
2.9	ADG_REDIRECT_DML	2-31
2.10	ALLOW_GLOBAL_DBLINKS	2-32
2.11	ALLOW_GROUP_ACCESS_TO_SGA	2-32
2.12	ALLOW_LEGACY_RECO_PROTOCOL	2-33
2.13	ALLOW_ROWID_COLUMN_TYPE	2-34
2.14	APPROX_FOR_AGGREGATION	2-35
2.15	APPROX_FOR_COUNT_DISTINCT	2-35
2.16	APPROX_FOR_PERCENTILE	2-36
2.17	AQ_TM_PROCESSES	2-37
2.18	ARCHIVE_LAG_TARGET	2-38
2.19	ASM_DISKGROUPS	2-38
2.20	ASM_DISKSTRING	2-39
2.21	ASM_IO_PROCESSES	2-40
2.22	ASM_POWER_LIMIT	2-41
2.23	ASM_PREFERRED_READ_FAILURE_GROUPS	2-42
2.24	AUDIT_FILE_DEST	2-43
2.25	AUDIT_SYS_OPERATIONS	2-44
2.26	AUDIT_SYSLOG_LEVEL	2-45
2.27	AUDIT_TRAIL	2-46
2.28	AUTOTASK_MAX_ACTIVE_PDBS	2-48
2.29	AWR_PDB_AUTOFLUSH_ENABLED	2-49
2.30	AWR_PDB_MAX_PARALLEL_SLAVES	2-50
2.31	AWR_SNAPSHOT_TIME_OFFSET	2-50
2.32	BACKGROUND_CORE_DUMP	2-51
2.33	BACKGROUND_DUMP_DEST	2-52
2.34	BACKUP_TAPE_IO_SLAVES	2-53
2.35	BITMAP_MERGE_AREA_SIZE	2-53
2.36	BLANK_TRIMMING	2-54
2.37	BLOCKCHAIN_TABLE_MAX_NO_DROP	2-55
2.38	BLOCKCHAIN_TABLE_RETENTION_THRESHOLD	2-56
2.39	CIRCUITS	2-56
2.40	CLIENT_RESULT_CACHE_LAG	2-57
2.41	CLIENT_RESULT_CACHE_SIZE	2-57
2.42	CLIENT_STATISTICS_LEVEL	2-58
2.43	CLONEDB	2-59

2.44	CLONEDB_DIR	2-60
2.45	CLUSTER_DATABASE	2-60
2.46	CLUSTER_INTERCONNECTS	2-61
2.47	COMMIT_LOGGING	2-62
2.48	COMMIT_POINT_STRENGTH	2-62
2.49	COMMIT_WAIT	2-63
2.50	COMMIT_WRITE	2-63
2.51	COMMON_USER_PREFIX	2-64
2.52	COMPATIBLE	2-66
2.53	CONNECTION_BROKERS	2-67
2.54	CONTAINER_DATA	2-69
2.55	CONTAINERS_PARALLEL_DEGREE	2-70
2.56	CONTROL_FILE_RECORD_KEEP_TIME	2-70
2.57	CONTROL_FILES	2-71
2.58	CONTROL_MANAGEMENT_PACK_ACCESS	2-72
2.59	CORE_DUMP_DEST	2-73
2.60	CPU_COUNT	2-73
2.61	CPU_MIN_COUNT	2-74
2.62	CREATE_BITMAP_AREA_SIZE	2-75
2.63	CREATE_STORED_OUTLINES	2-76
2.64	CURSOR_BIND_CAPTURE_DESTINATION	2-77
2.65	CURSOR_INVALIDATION	2-78
2.66	CURSOR_SHARING	2-78
2.67	CURSOR_SPACE_FOR_TIME	2-79
2.68	DATA_GUARD_MAX_IO_TIME	2-80
2.69	DATA_GUARD_MAX_LONGIO_TIME	2-81
2.70	DATA_GUARD_SYNC_LATENCY	2-81
2.71	DATA_TRANSFER_CACHE_SIZE	2-82
2.72	DB_nK_CACHE_SIZE	2-82
2.73	DB_BIG_TABLE_CACHE_PERCENT_TARGET	2-83
2.74	DB_BLOCK_BUFFERS	2-85
2.75	DB_BLOCK_CHECKING	2-86
2.76	DB_BLOCK_CHECKSUM	2-87
2.77	DB_BLOCK_SIZE	2-88
2.78	DB_CACHE_ADVICE	2-89
2.79	DB_CACHE_SIZE	2-90
2.80	DB_CREATE_FILE_DEST	2-91
2.81	DB_CREATE_ONLINE_LOG_DEST_n	2-92
2.82	DB_DOMAIN	2-93
2.83	DB_FILE_MULTIBLOCK_READ_COUNT	2-94
2.84	DB_FILE_NAME_CONVERT	2-95
2.85	DB_FILES	2-96

2.86	DB_FLASH_CACHE_FILE	2-96
2.87	DB_FLASH_CACHE_SIZE	2-97
2.88	DB_FLASHBACK_LOG_DEST	2-98
2.89	DB_FLASHBACK_LOG_DEST_SIZE	2-99
2.90	DB_FLASHBACK_RETENTION_TARGET	2-100
2.91	DB_INDEX_COMPRESSION_INHERITANCE	2-100
2.92	DB_KEEP_CACHE_SIZE	2-102
2.93	DB_LOST_WRITE_PROTECT	2-102
2.94	DB_NAME	2-103
2.95	DB_PERFORMANCE_PROFILE	2-104
2.96	DB_RECOVERY_AUTO_REKEY	2-105
2.97	DB_RECOVERY_FILE_DEST	2-105
2.98	DB_RECOVERY_FILE_DEST_SIZE	2-106
2.99	DB_RECYCLE_CACHE_SIZE	2-107
2.100	DB_SECUREFILE	2-107
2.101	DB_ULTRA_SAFE	2-109
2.102	DB_UNIQUE_NAME	2-110
2.103	DB_UNRECOVERABLE_SCN_TRACKING	2-111
2.104	DB_WRITER_PROCESSES	2-111
2.105	DBFIPS_140	2-112
2.106	DBNEST_ENABLE	2-113
2.107	DBNEST_PDB_FS_CONF	2-113
2.108	DBWR_IO_SLAVES	2-114
2.109	DDL_LOCK_TIMEOUT	2-115
2.110	DEFAULT_SHARING	2-115
2.111	DEFERRED_SEGMENT_CREATION	2-116
2.112	DG_BROKER_CONFIG_FILEn	2-116
2.113	DG_BROKER_START	2-117
2.114	DIAGNOSTIC_DEST	2-118
2.115	DIAGNOSTICS_CONTROL	2-119
2.116	DISK_ASYNC_IO	2-120
2.117	DISPATCHERS	2-120
2.118	DISTRIBUTED_LOCK_TIMEOUT	2-123
2.119	DML_LOCKS	2-123
2.120	DNFS_BATCH_SIZE	2-124
2.121	DRCP_CONNECTION_LIMIT	2-125
2.122	DRCP_DEDICATED_OPT	2-125

Part IV Appendixes

A Database Limits

A.1	Datatype Limits	A-1
A.2	Physical Database Limits	A-3
A.3	Logical Database Limits	A-4
A.4	Process and Runtime Limits	A-7

B SQL Scripts

B.1	Creating the Data Dictionary	B-1
B.2	Creating Additional Data Dictionary Structures	B-2
B.3	The "NO" Scripts	B-5
B.4	Upgrade Scripts	B-6
B.5	Java Scripts	B-6

C Oracle Wait Events

C.1	Classes of Wait Events	C-1
C.2	Descriptions of Common Wait Event Parameters	C-2
C.3	Descriptions of Wait Events	C-5
C.3.1	alter system set dispatcher	C-5
C.3.2	ARCH Remote Write	C-5
C.3.3	ASYNC Remote Write	C-5
C.3.4	BFILE check if exists	C-5
C.3.5	BFILE check if open	C-6
C.3.6	BFILE closure	C-6
C.3.7	BFILE get length	C-6
C.3.8	BFILE get name object	C-6
C.3.9	BFILE get path object	C-6
C.3.10	BFILE internal seek	C-7
C.3.11	BFILE open	C-7
C.3.12	BFILE read	C-7
C.3.13	broadcast mesg queue transition	C-7
C.3.14	broadcast mesg recovery queue transition	C-8
C.3.15	buffer busy waits	C-8
C.3.16	buffer deadlock	C-9
C.3.17	buffer latch	C-9
C.3.18	buffer read retry	C-9
C.3.19	checkpoint completed	C-10
C.3.20	cleanup of aborted process	C-10
C.3.21	control file parallel write	C-10
C.3.22	control file sequential read	C-10

C.3.23	control file single write	C-11
C.3.24	cursor: mutex S	C-11
C.3.25	cursor: mutex X	C-11
C.3.26	cursor: pin S	C-12
C.3.27	cursor: pin S wait on X	C-12
C.3.28	cursor: pin X	C-12
C.3.29	db file async I/O submit	C-13
C.3.30	db file parallel read	C-13
C.3.31	db file parallel write	C-13
C.3.32	db file scattered read	C-14
C.3.33	db file sequential read	C-14
C.3.34	db file single write	C-15
C.3.35	DFS lock handle	C-15
C.3.36	direct path read	C-16
C.3.37	direct path sync	C-16
C.3.38	direct path write	C-16
C.3.39	Disk file operations I/O	C-17
C.3.40	dispatcher shutdown	C-17
C.3.41	dispatcher timer	C-18
C.3.42	dupl. cluster key	C-18
C.3.43	enq: OW - initialization	C-18
C.3.44	enq: OW - termination	C-19
C.3.45	enq: SV - contention	C-19
C.3.46	enq: TX - index contention	C-19
C.3.47	enq: TX - row lock (HIGH priority)	C-19
C.3.48	enq: TX - row lock (LOW priority)	C-20
C.3.49	enq: TX - row lock (MEDIUM priority)	C-20
C.3.50	enq: TX - row lock contention	C-21
C.3.51	enqueue	C-21
C.3.52	flashback buf free by RVWR	C-22
C.3.53	flashback log file sync	C-22
C.3.54	free buffer waits	C-22
C.3.55	free global transaction table entry	C-23
C.3.56	free process state object	C-23
C.3.57	gc buffer busy acquire	C-23
C.3.58	gc buffer busy release	C-23
C.3.59	gc cr block 2-way	C-24
C.3.60	gc cr block 3-way	C-24
C.3.61	gc cr block busy	C-24
C.3.62	gc cr block congested	C-25
C.3.63	gc cr block direct read	C-25
C.3.64	gc cr block lost	C-25

C.3.65	gc cr grant read-mostly invalidation	C-26
C.3.66	gc cr multi block grant	C-26
C.3.67	gc cr multi block mixed	C-26
C.3.68	gc cr request	C-27
C.3.69	gc current block 2-way	C-27
C.3.70	gc current block 3-way	C-27
C.3.71	gc current block busy	C-27
C.3.72	gc current block congested	C-28
C.3.73	gc current block direct read	C-28
C.3.74	gc current block lost	C-29
C.3.75	gc current request	C-29
C.3.76	inactive session	C-29
C.3.77	inactive transaction branch	C-30
C.3.78	index split completion	C-30
C.3.79	instance state change	C-30
C.3.80	io done	C-30
C.3.81	ksxr wait for mount shared	C-31
C.3.82	ktm: instance recovery	C-31
C.3.83	latch activity	C-31
C.3.84	latch free	C-32
C.3.85	latch: redo copy	C-32
C.3.86	library cache load lock	C-32
C.3.87	library cache lock	C-33
C.3.88	library cache pin	C-33
C.3.89	library cache shutdown	C-34
C.3.90	library cache: mutex X	C-34
C.3.91	Log archive I/O	C-34
C.3.92	log buffer space	C-34
C.3.93	log file parallel write	C-35
C.3.94	log file sequential read	C-35
C.3.95	log file single write	C-35
C.3.96	log file switch (archiving needed)	C-36
C.3.97	log file switch (checkpoint incomplete)	C-36
C.3.98	log file switch (clearing log file)	C-36
C.3.99	log file switch (private strand flush incomplete)	C-36
C.3.100	log file switch completion	C-36
C.3.101	log file sync	C-36
C.3.102	log switch/archive	C-37
C.3.103	optimizer stats update retry	C-37
C.3.104	parallel recovery change buffer free	C-37
C.3.105	parallel recovery control message reply	C-37
C.3.106	parallel recovery coord send blocked	C-38

C.3.107	parallel recovery coord wait for reply	C-38
C.3.108	parallel recovery coordinator waits for slave cleanup	C-38
C.3.109	parallel recovery read buffer free	C-38
C.3.110	parallel recovery slave next change	C-38
C.3.111	pending global transaction(s)	C-38
C.3.112	pipe get	C-39
C.3.113	pipe put	C-39
C.3.114	PL/SQL lock timer	C-39
C.3.115	pmon timer	C-39
C.3.116	prior spawner clean up	C-40
C.3.117	process startup	C-40
C.3.118	PX Deque wait	C-40
C.3.119	PX qref latch	C-41
C.3.120	PX server shutdown	C-41
C.3.121	PX signal server	C-41
C.3.122	rdbms ipc message	C-41
C.3.123	rdbms ipc message block	C-42
C.3.124	rdbms ipc reply	C-42
C.3.125	read by other session	C-42
C.3.126	recovery active instance mapping setup	C-42
C.3.127	recovery apply pending	C-42
C.3.128	recovery cancel	C-43
C.3.129	recovery checkpoint	C-43
C.3.130	recovery file header update for checkpoint	C-43
C.3.131	recovery file header update for fuzziness	C-43
C.3.132	recovery marker apply	C-43
C.3.133	recovery merge pending	C-43
C.3.134	recovery metadata latch	C-43
C.3.135	recovery move influx buffers	C-43
C.3.136	recovery read	C-43
C.3.137	recovery receive buffer free	C-44
C.3.138	recovery remote file verification	C-44
C.3.139	recovery send buffer free	C-44
C.3.140	recovery shutdown	C-44
C.3.141	Redo Transport Attach	C-44
C.3.142	Redo Transport Close	C-44
C.3.143	Redo Transport Detach	C-45
C.3.144	Redo Transport Open	C-45
C.3.145	Redo Transport Ping	C-45
C.3.146	Redo Transport Slave Startup	C-45
C.3.147	Redo Writer Remote Sync Complete	C-45
C.3.148	Redo Writer Remote Sync Notify	C-45

C.3.149	resmgr:become active	C-46
C.3.150	resmgr:cpu quantum	C-46
C.3.151	resmgr: I/O rate limit	C-46
C.3.152	resmgr:pq queued	C-47
C.3.153	rolling migration: cluster quiesce	C-47
C.3.154	row cache lock	C-47
C.3.155	RVWR wait for flashback copy	C-48
C.3.156	sbtbufinfo	C-48
C.3.157	sbtgetbuf	C-48
C.3.158	sbtmapbuf	C-48
C.3.159	sbtrelbuf	C-48
C.3.160	scging AST call	C-49
C.3.161	SGA: allocation forcing component growth	C-49
C.3.162	SGA: MMAN sleep for component shrink	C-49
C.3.163	SGA: sga_target resize	C-49
C.3.164	Shared IO Pool Memory	C-49
C.3.165	shared server idle wait	C-50
C.3.166	single-task message	C-50
C.3.167	smon timer	C-50
C.3.168	SQL*Net break/reset to client	C-50
C.3.169	SQL*Net break/reset to dblink	C-51
C.3.170	SQL*Net message from client	C-51
C.3.171	SQL*Net message from dblink	C-51
C.3.172	SQL*Net message to client	C-52
C.3.173	SQL*Net message to dblink	C-52
C.3.174	SQL*Net more data from client	C-52
C.3.175	SQL*Net more data from dblink	C-53
C.3.176	SQL*Net more data to client	C-53
C.3.177	SQL*Net more data to dblink	C-53
C.3.178	Streams AQ: waiting for messages in the queue	C-53
C.3.179	switch logfile command	C-54
C.3.180	SYNC Remote Write	C-54
C.3.181	TCP Socket (KGAS)	C-54
C.3.182	timer in sksawat	C-54
C.3.183	transaction	C-55
C.3.184	unbound tx	C-55
C.3.185	undo_retention publish retry	C-55
C.3.186	undo segment extension	C-55
C.3.187	undo segment recovery	C-56
C.3.188	undo segment tx slot	C-56
C.3.189	utl_file I/O	C-56
C.3.190	virtual circuit wait	C-56

C.3.191	WCR: replay client notify	C-56
C.3.192	WCR: replay clock	C-57
C.3.193	WCR: replay lock order	C-57
C.3.194	WCR: replay paused	C-57
C.3.195	WCR: Sync context busy	C-57
C.3.196	write complete waits	C-57

F Background Processes

Index

Preface

This manual provides reference information about database initialization parameters, static data dictionary views, dynamic performance views, database limits, and SQL scripts that are part of the Oracle Database.

This preface contains these topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Diversity and Inclusion](#)
- [Related Documents](#)
- [Conventions](#)

Audience

Oracle Database Reference is intended for database administrators, system administrators, and database application developers.

To use this document, you need to be familiar with the following:

- Oracle database management system (DBMS) concepts
- Your operating system environment

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customer access to and use of Oracle support services will be pursuant to the terms and conditions specified in their Oracle order for the applicable services.

Diversity and Inclusion

Oracle is fully committed to diversity and inclusion. Oracle respects and values having a diverse workforce that increases thought leadership and innovation. As part of our initiative to build a more inclusive culture that positively impacts our employees, customers, and partners, we are working to remove insensitive terms from our products and documentation. We are also mindful of the necessity to maintain compatibility with our customers' existing technologies and the need to ensure continuity of service as Oracle's offerings and industry standards evolve. Because of these technical constraints, our effort to remove insensitive terms is ongoing and will take time and external cooperation.

Related Documents

For more information, see these Oracle resources:

- *Oracle Database Concepts* for a comprehensive introduction to the concepts and terminology used in this manual
- *Oracle Database Administrator's Guide* for information about administering Oracle Database
- *Oracle Database Upgrade Guide* for the procedures for upgrading a previous release of Oracle to the new release
- *Oracle Database SQL Language Reference* for information on Oracle's SQL commands and functions
- *Oracle Database Development Guide* for information about developing database applications within Oracle Database

The complete documentation set for Oracle Database is available on the Oracle Help Center:

<http://docs.oracle.com/database/>

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

1

Changes in This Release for Oracle Database Reference

This chapter lists the following changes in *Oracle Database Reference* for Oracle Database 23ai:

- [Changes in Oracle Database 23ai, Release Update 23.6](#)
- [Changes in Oracle Database 23ai](#)

1.1 Changes in Oracle Database 23ai, Release Update 23.6

The following static data dictionary views are new in Oracle Database 23ai, Release Update 23.6:

- [ALL_JSON_COLLECTION_VIEWS](#), [DBA_JSON_COLLECTION_VIEWS](#), and [USER_JSON_COLLECTION_VIEWS](#)

1.2 Changes in Oracle Database 23ai

This section lists the following changes in *Oracle Database Reference* for Oracle Database 23ai:

- [New Features](#)
- [Deprecated Features](#)
- [Desupported Features](#)

1.2.1 New Features

- The following feature is new in Oracle Database 23ai:
 - The maximum number of columns allowed in a database table or view has been increased from 1000 to 4096.
See: [MAX_COLUMNS](#)
- The following initialization parameters are new in Oracle Database 23ai:
 - [ALLOW_LEGACY_RECO_PROTOCOL](#)
 - [BLOCKCHAIN_TABLE_RETENTION_THRESHOLD](#)
 - [DB_FLASHBACK_LOG_DEST](#)
 - [DB_FLASHBACK_LOG_DEST_SIZE](#)
 - [DB_RECOVERY_AUTO_REKEY](#)
 - [ERROR_MESSAGE_DETAILS](#)
 - [GROUP_BY_POSITION_ENABLED](#)
 - [HYBRID_READ_ONLY](#)

- IDENTITY_PROVIDER_CONFIG
- IDENTITY_PROVIDER_TYPE
- INMEMORY_OPTIMIZED_DATE
- IORM_LIMIT_POLICY
- JSON_BEHAVIOR
- JSON_EXPRESSION_CHECK
- MAX_COLUMNS
- MAX_SAGA_DURATION
- MEMOPTIMIZE_WRITE_AREA_SIZE
- MEMOPTIMIZE_WRITES
- MEMORY_MAX_SIZE
- MEMORY_SIZE
- MLE_PROG_LANGUAGES
- PLSQL_IMPLICIT_CONVERSION_BOOL
- PRIORITY_TXNS_HIGH_WAIT_TARGET
- PRIORITY_TXNS_MEDIUM_WAIT_TARGET
- PRIORITY_TXNS_MODE
- READ_ONLY
- RESOURCE_MANAGER_CPU_SCOPE
- RESULT_CACHE_AUTO_BLOCKLIST
- RESULT_CACHE_INTEGRITY
- SAGA_HIST_RETENTION
- SESSION_EXIT_ON_PACKAGE_STATE_ERROR
- SHARD_ENABLE_RAFT_FOLLOWER_READ
- SHARD_RAFT_LOGFILE_SIZE
- SQL_ERROR_MITIGATION
- SQL_HISTORY_ENABLED
- SQL_TRANSPILER
- TABLESPACE_ENCRYPTION
- TIME_AT_DBTIMEZONE
- TRANSACTION_RECOVERY
- TRUE_CACHE
- TXN_PRIORITY
- XML_PARAMS
- The following static data dictionary views are new in Oracle Database 23ai:
 - DBA_ADDM_PENDING_AUTOTASKS
 - DBA_ADDM_SCHEDULED_AUTOTASKS
 - DBA_AIM_PERF_FEATURES

- ALL_ANNOTATION_VALUES, DBA_ANNOTATION_VALUES, and USER_ANNOTATION_VALUES
- ALL_ANNOTATIONS, DBA_ANNOTATIONS, and USER_ANNOTATIONS
- ALL_ANNOTATIONS_USAGE, DBA_ANNOTATIONS_USAGE, and USER_ANNOTATIONS_USAGE
- DBA_AUTO_CLUSTERING_CONFIG
- DBA_AUTO_CLUSTERING_RECOMMENDATIONS
- ALL_BLOCKCHAIN_ROW_VERSION_COLS, DBA_BLOCKCHAIN_ROW_VERSION_COLS, and USER_BLOCKCHAIN_ROW_VERSION_COLS
- ALL_BLOCKCHAIN_ROW_VERSION_HISTORY, DBA_BLOCKCHAIN_ROW_VERSION_HISTORY, and USER_BLOCKCHAIN_ROW_VERSION_HISTORY
- ALL_BLOCKCHAIN_TABLE_CHAINS, DBA_BLOCKCHAIN_TABLE_CHAINS, and USER_BLOCKCHAIN_TABLE_CHAINS
- ALL_BLOCKCHAIN_TABLE_EPOCHS, DBA_BLOCKCHAIN_TABLE_EPOCHS, and USER_BLOCKCHAIN_TABLE_EPOCHS
- ALL_BLOCKCHAIN_TABLE_HASH_COL_ORDER, DBA_BLOCKCHAIN_TABLE_HASH_COL_ORDER, and USER_BLOCKCHAIN_TABLE_HASH_COL_ORDER
- DBA_BLOCKER_RESOLVER_PARAMETERS
- DBA_DDL_REGS and USER_DDL_REGS
- ALL_DOMAIN_COLS, DBA_DOMAIN_COLS, and USER_DOMAIN_COLS
- ALL_DOMAIN_CONSTRAINTS, DBA_DOMAIN_CONSTRAINTS, and USER_DOMAIN_CONSTRAINTS
- ALL_DOMAINS, DBA_DOMAINS, and USER_DOMAINS
- DBA_HIST_OPTIMIZER_ENV_DETAILS
- ALL_HIST_SAGAS, DBA_HIST_SAGAS, and USER_HIST_SAGAS
- ALL_IMMUTABLE_ROW_VERSION_COLS, DBA_IMMUTABLE_ROW_VERSION_COLS, and USER_IMMUTABLE_ROW_VERSION_COLS
- ALL_IMMUTABLE_ROW_VERSION_HISTORY, DBA_IMMUTABLE_ROW_VERSION_HISTORY, and USER_IMMUTABLE_ROW_VERSION_HISTORY
- ALL_IMMUTABLE_TABLE_COLUMNS, DBA_IMMUTABLE_TABLE_COLUMNS, and USER_IMMUTABLE_TABLE_COLUMNS
- ALL_IMMUTABLE_TABLE_EPOCHS, DBA_IMMUTABLE_TABLE_EPOCHS, and USER_IMMUTABLE_TABLE_EPOCHS
- ALL_INCOMPLETE_SAGAS, DBA_INCOMPLETE_SAGAS, and USER_INCOMPLETE_SAGAS
- DBA_INMEMORY_ADVISOR_RECOMMENDATION
- ALL_JSON_COLLECTION_TABLES, DBA_JSON_COLLECTION_TABLES, and USER_JSON_COLLECTION_TABLES

- ALL_JSON_COLLECTIONS, DBA_JSON_COLLECTIONS, and USER_JSON_COLLECTIONS
- ALL_JSON_DOMAIN_SCHEMA_COLUMNS, DBA_JSON_DOMAIN_SCHEMA_COLUMNS, and USER_JSON_DOMAIN_SCHEMA_COLUMNS
- ALL_JSON_DUALITY_VIEW_LINKS, DBA_JSON_DUALITY_VIEW_LINKS, and USER_JSON_DUALITY_VIEW_LINKS
- ALL_JSON_DUALITY_VIEW_TAB_COLS, DBA_JSON_DUALITY_VIEW_TAB_COLS, and USER_JSON_DUALITY_VIEW_TAB_COLS
- ALL_JSON_DUALITY_VIEW_TABS, DBA_JSON_DUALITY_VIEW_TABS, and USER_JSON_DUALITY_VIEW_TABS
- ALL_JSON_DUALITY_VIEWS, DBA_JSON_DUALITY_VIEWS, and USER_JSON_DUALITY_VIEWS
- ALL_JSON_INDEXES, DBA_JSON_INDEXES, and USER_JSON_INDEXES
- ALL_JSON_SCHEMA_COLUMNS, DBA_JSON_SCHEMA_COLUMNS, and USER_JSON_SCHEMA_COLUMNS
- DBA_KAFKA_APPLICATIONS and USER_KAFKA_APPLICATIONS
- DBA_KAFKA_CLUSTERS and USER_KAFKA_CLUSTERS
- DBA_KAFKA_LOAD_METRICS and USER_KAFKA_LOAD_METRICS
- USER_KAFKA_MESSAGES
- DBA_KAFKA_OPS and USER_KAFKA_OPS
- DBA_KAFKA_OPS_RESULTS and USER_KAFKA_OPS_RESULTS
- DBA_KAFKA_PARTITIONS and USER_KAFKA_PARTITIONS
- ALL_MLE_ENV_IMPORTS, DBA_MLE_ENV_IMPORTS, and USER_MLE_ENV_IMPORTS
- ALL_MLE_ENVS, DBA_MLE_ENVS, and USER_MLE_ENVS
- ALL_MLE_MODULES, DBA_MLE_MODULES, and USER_MLE_MODULES
- ALL_MLE_PROCEDURES, DBA_MLE_PROCEDURES, and USER_MLE_PROCEDURES
- ALL_MVIEW_DETAIL_LOGICAL_PARTITION, DBA_MVIEW_DETAIL_LOGICAL_PARTITION, and USER_MVIEW_DETAIL_LOGICAL_PARTITION
- ALL_PG_EDGE_RELATIONSHIPS, DBA_PG_EDGE_RELATIONSHIPS, and USER_PG_EDGE_RELATIONSHIPS
- ALL_PG_ELEMENT_LABELS, DBA_PG_ELEMENT_LABELS, and USER_PG_ELEMENT_LABELS
- ALL_PG_ELEMENTS, DBA_PG_ELEMENTS, and USER_PG_ELEMENTS
- ALL_PG_KEYS, DBA_PG_KEYS, and USER_PG_KEYS
- ALL_PG_LABEL_PROPERTIES, DBA_PG_LABEL_PROPERTIES, and USER_PG_LABEL_PROPERTIES
- ALL_PG_LABELS, DBA_PG_LABELS, and USER_PG_LABELS
- ALL_PG_PROP_DEFINITIONS, DBA_PG_PROP_DEFINITIONS, and USER_PG_PROP_DEFINITIONS

- ALL_PROPERTY_GRAPHS, DBA_PROPERTY_GRAPHS, and USER_PROPERTY_GRAPHS
- DBA_QUARANTINED_TRANSACTIONS
- ALL_SAGA_BROKERS, DBA_SAGA_BROKERS, and USER_SAGA_BROKERS
- ALL_SAGA_DETAILS, DBA_SAGA_DETAILS, and USER_SAGA_DETAILS
- ALL_SAGA_ERRORS, DBA_SAGA_ERRORS, and USER_SAGA_ERRORS
- ALL_SAGA_FINALIZATION, DBA_SAGA_FINALIZATION, and USER_SAGA_FINALIZATION
- ALL_SAGA_PARTICIPANT_SET, DBA_SAGA_PARTICIPANT_SET, and USER_SAGA_PARTICIPANT_SET
- ALL_SAGA_PARTICIPANTS, DBA_SAGA_PARTICIPANTS, and USER_SAGA_PARTICIPANTS
- ALL_SAGA_PENDING, DBA_SAGA_PENDING, and USER_SAGA_PENDING
- ALL_SAGAS, DBA_SAGAS, and USER_SAGAS
- DBA_SCHEDULER_IN_MEMORY_TRACE
- DBA_SCHEMA_PRIVS, ROLE_SCHEMA_PRIVS, SESSION_SCHEMA_PRIVS, and USER_SCHEMA_PRIVS

1.2.3 Desupported Features

The following features are desupported in Oracle Database 23ai:

- The `OPTIMIZER_SECURE_VIEW_MERGING` initialization parameter
- The `V$EMX_USAGE_STATS` view

See Also:

Oracle Database Upgrade Guide for a complete list of desupported features for this release

Part I

Initialization Parameters

Database initialization parameters can be specified in a parameter file to start or configure an instance.

This part contains the following chapter:

- [Initialization Parameters](#)

Note:

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

2

Initialization Parameters

This chapter contains detailed descriptions (in alphabetical order) of the database initialization parameters.

This chapter contains the following topics:

- [Uses of Initialization Parameters](#)
- [Basic Initialization Parameters](#)
- [Parameter Files](#)
- [Changing Parameter Values in a Parameter File](#)
- [Reading the Parameter Descriptions](#)
- [Initialization Parameter Descriptions](#)

2.1 Uses of Initialization Parameters

Initialization parameters are used to perform various functions.

For example, initialization parameters are used to:

- Set limits for the entire database
- Set user or process limits
- Set limits on database resources
- Affect performance (these are called **variable parameters**)

Variable parameters are of particular interest to database administrators, because these parameters are used primarily to improve database performance.

Database administrators can use initialization parameters to:

- Optimize performance by adjusting memory structures, such as the number of database buffers in memory
- Set database-wide defaults, such as the amount of space initially allocated for a context area when it is created
- Set database limits, such as the maximum number of database users
- Specify names of files or directories required by the database

Many initialization parameters can be fine-tuned to improve database performance. Other parameters should never be altered or should be altered only under the supervision of Oracle Support Services.

All initialization parameters are optional. Oracle has a default value for each parameter. This value may be operating system-dependent, depending on the parameter.

2.1.1 Types of Initialization Parameters

The Oracle database server has derived parameters, operating system-dependent parameters, and variable parameters.

- [Derived Parameters](#)
- [Operating System-Dependent Parameters](#)
- [Variable Parameters](#) (these can be dynamic parameters or any of the preceding ones)

2.1.1.1 Derived Parameters

Some initialization parameters are **derived**, meaning that their values are calculated from the values of other parameters. Normally, you should not alter values for derived parameters, but if you do, then the value you specify will override the calculated value.

For example, the default value of the `SESSIONS` parameter is derived from the value of the `PROCESSES` parameter. If the value of `PROCESSES` changes, then the default value of `SESSIONS` changes as well, unless you override it with a specified value.

2.1.1.2 Operating System-Dependent Parameters

The valid values or value ranges of some initialization parameters depend upon the host operating system. For example, the parameter `DB_BLOCK_BUFFERS` indicates the number of data buffers in main memory, and its maximum value depends on the operating system. The size of those buffers, set by `DB_BLOCK_SIZE`, has an operating system-dependent default value.

See Also:

Your operating system-specific Oracle documentation for more information on operating system-dependent Oracle parameters and operating system parameters

2.1.1.3 Variable Parameters

The variable initialization parameters offer the most potential for improving system performance. Some variable parameters set capacity limits but do not affect performance. For example, when the value of `OPEN_CURSORS` is 10, a user process attempting to open its eleventh cursor receives an error. Other variable parameters affect performance but do not impose absolute limits. For example, reducing the value of `DB_BLOCK_BUFFERS` does not prevent work even though it may slow down performance.

Increasing the values of variable parameters may improve your system's performance, but increasing most parameters also increases the system global area (SGA) size. A larger SGA can improve database performance up to a point. In virtual memory operating systems, an SGA that is too large can degrade performance if it is swapped in and out of memory. Operating system parameters that control virtual memory working areas should be set with the SGA size in mind. The operating system configuration can also limit the maximum size of the SGA.

2.2 Basic Initialization Parameters

Most databases should only need to have the database basic initialization parameters set to run properly and efficiently.

Oracle advises you to become familiar with the basic parameters and only use other parameters when directed to by feature documentation or in special circumstances. The following is a list of the database basic initialization parameters:

CLUSTER_DATABASE
COMPATIBLE
CONTROL_FILES
DB_BLOCK_SIZE
DB_CREATE_FILE_DEST
DB_CREATE_ONLINE_LOG_DEST_1
DB_DOMAIN
DB_NAME
DB_RECOVERY_FILE_DEST
DB_RECOVERY_FILE_DEST_SIZE
DB_UNIQUE_NAME
INSTANCE_NUMBER
LDAP_DIRECTORY_SYSAUTH
LOG_ARCHIVE_DEST_1
LOG_ARCHIVE_DEST_STATE_1
NLS_DATE_LANGUAGE
NLS_TERRITORY
OPEN_CURSORS
PGA_AGGREGATE_TARGET
PROCESSES
REMOTE_LISTENER
REMOTE_LOGIN_PASSWORDFILE
SESSIONS
SGA_TARGET
SHARED_SERVERS
STAR_TRANSFORMATION_ENABLED
UNDO_TABLESPACE

2.3 Parameter Files

A **parameter file** is a file that contains a list of initialization parameters and a value for each parameter. You specify initialization parameters in a parameter file that reflect your particular installation.

Oracle supports the following two types of parameter files:

- [Server Parameter Files](#)
- [Initialization Parameter Files](#)

2.3.1 Server Parameter Files

A **server parameter file** is a binary file that acts as a repository for initialization parameters.

The server parameter file can reside on the computer where the Oracle database server executes. Initialization parameters stored in a server parameter file are persistent, in that any changes made to the parameters while an instance is running can persist across instance shutdown and startup.

 See Also:

Oracle Database Administrator's Guide for an introduction to and detailed information about managing and using server parameter files and initialization parameter files

2.3.2 Initialization Parameter Files

An **initialization parameter file** is a text file that contains a list of initialization parameters.

 Note:

See "[About the Character Set of Parameter Values](#)" for more information about the character set to use when specifying values in an initialization parameter file.

The following are sample entries in an initialization parameter file:

```
PROCESSES = 100
OPEN_LINKS = 12
GLOBAL_NAMES = true
```

The name of the initialization parameter file varies depending on the operating system. For example, it can be in mixed case or lowercase, or it can have a logical name or a variation of the name `init.ora`. Also supplied is an `initdw.ora` file, which contains suggested parameter settings for data warehouses and data marts. The database administrator can choose a different file name for the initialization parameter file.

Refer to your operating system-specific Oracle documentation for the default locations and filenames for initialization parameter files on your operating system. The initialization parameter file is read by the client-side tool used to start the server (such as SQL*Plus).

Sample initialization parameter files are provided on the Oracle distribution medium for each operating system. A sample file is sufficient for initial use, but you will probably want to modify the file to tune the database for best performance. Any changes will take effect after you completely shut down and restart the instance.

2.3.2.1 About the Character Set of Parameter Values

Only characters from the default character set of the database platform are supported in parameter values. For all platforms except IBM z/OS and Fujitsu BS2000 the default platform character set is US7ASCII (7-bit ASCII).

The database behavior is undefined when parameter values with unsupported characters are specified. When using the `ALTER SYSTEM` statement to set a parameter value in a server parameter file, make sure only supported characters are used. The database does not always report an error when a value with unsupported characters is specified.

The initialization parameter file is a client-side file. When used, it is located on the host on which you start SQL*Plus to start up a database instance. The initialization parameter file must be written in the client character set as specified by the `NLS_LANG` client setting. However, parameter values should not contain characters not supported by the default character set of the database.

2.3.2.2 Specifying Values in an Initialization Parameter File

This section describes several aspects of setting parameter values in an initialization parameter file.

2.3.2.2.1 Rules Governing Initialization Parameter Files

This section describes the rules that govern the specification of parameters in initialization parameter files.

- An initialization parameter file should contain only parameters and comments. A pound sign (#) starts a comment line. The rest of the line is ignored.
- Comments must use the same character set as parameter values.
- You can specify parameters in any order.
- Case (upper or lower) in filenames is significant only if case is significant on the host operating system.
- To enter several parameters on one line, use spaces between parameter names and values, as in the following example:

```
PROCESSES = 100 CPU_COUNT = 1 OPEN_CURSORS = 10
```

- Some parameters, such as `ROLLBACK_SEGMENTS`, accept multiple values. Any of the following represent valid syntax.

- Enter multiple values enclosed in parentheses and separated by commas. For example:

```
ROLLBACK_SEGMENTS = (SEG1, SEG2, SEG3, SEG4, SEG5)
```

- Enter multiple values without parentheses and commas. For example:

```
ROLLBACK_SEGMENTS = SEG1 SEG2 SEG3 SEG4 SEG5
```

- Enter multiple values, one per line. For example:

```
ROLLBACK_SEGMENTS = SEG1  
ROLLBACK_SEGMENTS = SEG2  
ROLLBACK_SEGMENTS = SEG3  
ROLLBACK_SEGMENTS = SEG4  
ROLLBACK_SEGMENTS = SEG5
```

If you enter values for one parameter on multiple lines, then the entries must be on consecutive lines. If they are not, then the first entry will not be processed properly. For example, in the following entry the setting for `SEG3` and `SEG4` will override the setting for `SEG1` and `SEG2`:

```
ROLLBACK_SEGMENTS = SEG1 SEG2  
OPEN_CURSORS = 10  
ROLLBACK_SEGMENTS = SEG3 SEG4
```

- A backslash (\), also known as an escape character, indicates continuation of the parameter specification. If a backslash continues a line, then the continued line must have no leading spaces. For example:

```
ROLLBACK_SEGMENTS = (SEG1, SEG2, \
SEG3, SEG4, SEG5)
```

- You can use the `IFILE` initialization parameter to embed the contents of another initialization parameter file into the current initialization parameter file.
- Enclose in quotation marks any parameter values that contain spaces or tabs. You can use either single or double quotation marks unless otherwise indicated. For example:

```
NLS_TERRITORY = 'CZECH REPUBLIC'
```

 Note:

Listing parameters in alphabetical order in the initialization parameter file can help you to find them and can help ensure that each parameter is specified only once.

- Enclose in quotation marks any parameter value that contains a special character.

 See Also:

- Your operating system-specific Oracle documentation for more information on initialization parameter files
- `"IFILE"`

2.3.2.2.2 Using Expressions for Parameter Values

You can specify an expression as the value for an initialization parameter.

The optimal value for an initialization parameter can depend on environmental characteristics, such as system configurations, run-time decisions, and the values of other parameters. In previous releases, you were required to specify an absolute value when setting an initialization parameter, which meant that maintaining its optimal value required manual oversight and adjustments. Starting with Oracle Database 21c, you can specify an expression as the value for some initialization parameters, which enables the database to automatically adjust the parameter value in response to environmental changes.

Specifying an expression for a parameter value is also useful in Oracle Real Application Cluster (Oracle RAC) environments. You can specify the same expression for a parameter value across all Oracle RAC instances, but the expression will be evaluated on a per-instance basis, utilizing the environmental characteristics of the current instance. This allows the database to fine-tune the parameter value for each Oracle RAC instance.

You can specify expressions only for initialization parameters of type integer or big integer.

Initialization parameter expressions can contain the following constructs:

1. Integer values

```
OLAP_PAGE_POOL_SIZE = 1073741824
```

2. Decimal values, but only when they are part of a numeric operation

```
CPU_COUNT = 8 * 0.6
```

If the operation evaluates to a decimal value, then the result is truncated to an integer value. The above example would set `CPU_COUNT` to 4.

3. An integer value followed by an indicator that the integer is expressed in kilobytes (k or K), megabytes (m or M), gigabytes (g or G), terabytes (t or T), petabytes (p or P), or exabytes (e or E)

```
OLAP_PAGE_POOL_SIZE = 900m  
MEMORY_TARGET = 2G
```

4. Other parameter names

```
JOB_QUEUE_PROCESSES = PROCESSES
```

5. The binary operators for multiplication (*), division (/), modulo (%), addition (+), and subtraction (-)

```
SHARED_SERVERS = MAX_SHARED_SERVERS / 2  
DATA_GUARD_MAX_LONGIO_TIME = DATA_GUARD_MAX_IO_TIME + 10 * 3
```

Operator precedence: the multiplication, division, and modulo operators are evaluated first, from left to right, and then the addition and subtraction operators are evaluated from left to right.

If the expression evaluates to a decimal value, then the result is truncated to an integer value.

6. Parentheses, which allow you to override operator precedence

```
SHARED_SERVERS = (MAX_SHARED_SERVERS - 1) / 2  
DATA_GUARD_MAX_LONGIO_TIME = (DATA_GUARD_MAX_IO_TIME + 10) * 3
```

7. The `MIN` and `MAX` functions. These functions take two operands and return the minimum and maximum value, respectively.

```
AQ_TM_PROCESSES = MIN(40, PROCESSES * .1)  
SESSIONS = MAX(200, PROCESSES * 1.5)
```

8. Environment variable values, which must be preceded by the dollar sign (\$)

```
CPU_COUNT = $SYSTEM_CPU/5
```

You can specify an expression when using any of the following methods to set an initialization parameter:

- In a server parameter file (SPFILE)
- In a text initialization parameter file, for example, `initORACLE_SID.ora`.

Note that you cannot use expressions in a client-side text initialization parameter file (PFILE).

- In the SQL statements `ALTER SESSION SET` and `ALTER SYSTEM SET`. In this case you must enclose the expression in single quotation marks. For example:

```
ALTER SESSION SET AQ_TM_PROCESSES = 'MIN(40, PROCESSES * .1)';  
ALTER SYSTEM SET JOB_QUEUE_PROCESSES = 'PROCESSES' SCOPE=BOTH;
```

2.3.2.2.3 Using Special Characters in Parameter Values

If a parameter value contains a special character, then the special character must be preceded by a backslash or the entire parameter value must be enclosed in quotation marks.

For example, you can specify special characters using either of the following:

```
DB_DOMAIN = 'JAPAN.ACME#.COM'
```

```
DB_DOMAIN = JAPAN.ACME\#.COM
```

[Table 2-1](#) lists the special characters you can use in initialization parameter files.

Table 2-1 Special Characters in Initialization Parameter Files

Character	Name	Description
#	Number sign	Comment
(	Left parenthesis	Start list of values
)	Right parenthesis	End list of values
"	Double quotation mark	Start or end of quoted string
'	Single quotation mark	Start or end of quoted string
=	Equal sign	Separator of keyword and values
,	Comma	Separator of elements
-	Minus sign	Precedes UNIX-style keywords
\	Backslash	Escape character

If a special character must be treated literally in an initialization parameter file, then it must either be preceded by the backslash character, or the entire string containing the special character must be enclosed in quotation marks.

2.3.2.2.4 Using the Escape Character

In an initialization parameter file, a backslash (\) can also signify a line continuation. If the backslash is followed by an alphanumeric character, then the backslash is treated as a normal character in the input.

If it is not followed by an alphanumeric character, then the backslash is treated either as a backslash or as a continuation character.

See Also:

["Rules Governing Initialization Parameter Files"](#)

2.3.2.2.5 Using Quotation Marks

Quotation marks can be nested in two ways in an initialization parameter file.

The first method is to double the quotation marks in the nested string. For example:

```
NLS_DATE_FORMAT = '''Today is''' MM/DD/YYYY'
```

The second method is to alternate single and double quotation marks. For example:

```
NLS_DATE_FORMAT = '"Today is" MM/DD/YYYY'
```

2.4 Changing Parameter Values in a Parameter File

You can change the value of a parameter in a parameter file in several ways.

- By editing an initialization parameter file
In most cases, the new value takes effect the next time you start an instance of the database.
- By issuing an `ALTER SYSTEM SET ... SCOPE=SPFILE` statement to update a server parameter file
- By issuing an `ALTER SYSTEM RESET` statement to clear an initialization parameter value.

See Also:

Oracle Database Administrator's Guide for more information about using the `ALTER SYSTEM RESET` statement to clear initialization parameter values

2.4.1 Parameters by Functional Category

2.4.2 Modifiable Parameters

You can modify some initialization parameters using the `ALTER SESSION` or `ALTER SYSTEM` statements while an instance is running.

Use the following syntax to modify initialization parameters:

```
ALTER SESSION SET parameter_name = value
ALTER SYSTEM SET parameter_name = value [DEFERRED]
```

Whenever a parameter is modified using the `ALTER SYSTEM` statement, the Oracle Database records the statement that modifies the parameter in the alert log.

The `ALTER SESSION` statement changes the value of the specified parameter for the duration of the session that invokes the statement. The value of the parameter does not change for other sessions in the instance. The value of the following initialization parameters can be changed with `ALTER SESSION`:

ALLOW_ROWID_COLUMN_TYPE

The `ALTER SYSTEM ... DEFERRED` statement does not modify the global value of the parameter for existing sessions, but the value will be modified for future sessions that connect to the database. The value of the following initialization parameters can be changed with `ALTER SYSTEM ... DEFERRED`:

AUDIT_FILE_DEST
BACKUP_TAPE_IO_SLAVES
CLIENT_STATISTICS_LEVEL
OBJECT_CACHE_MAX_SIZE_PERCENT
OBJECT_CACHE_OPTIMAL_SIZE
OLAP_PAGE_POOL_SIZE
PRIVATE_TEMP_TABLE_PREFIX
RECYCLEBIN
SESSION_CACHED_CURSORS
SORT_AREA_RETAINED_SIZE
SORT_AREA_SIZE

2.4.3 Displaying Current Parameter Values

You can use the SQL*Plus `SHOW PARAMETERS` statement to see the current settings for initialization parameters.

For example:

```
SQL> SHOW PARAMETERS
```

This statement displays all parameters in alphabetical order, along with their current values.

Enter the following text string to display all parameters having `BLOCK` in their names:

```
SQL> SHOW PARAMETERS BLOCK
```

You can use the `SPOOL` command to write the output to a file.

2.4.4 Parameters You Should Not Specify in the Parameter File

You should not specify these types of parameters in your parameter files:

- Parameters that you never alter unless instructed to do so by Oracle to resolve a problem
- Derived parameters, which normally do not need altering because their values are calculated automatically by the Oracle database server

2.4.5 When Parameters Are Set Incorrectly

When a parameter is set incorrectly, the effect can be different for different parameters, or based on how low or high the parameter is set.

Some parameters have a minimum setting below which an Oracle instance will not start. For other parameters, setting the value too low or too high may cause Oracle to perform badly, but it will still run. Also, Oracle may convert some values outside the acceptable range to usable levels.

If a parameter value is too low or too high, or you have reached the maximum for some resource, then Oracle returns an error. Frequently, you can wait a short while and retry the operation when the system is not as busy. If a message occurs repeatedly, then you should shut down the instance, adjust the relevant parameter, and restart the instance.

2.5 Reading the Parameter Descriptions

This section describes the properties that are documented in the initialization parameter descriptions.

PARAMETER_NAME

Property	Description
Parameter type	Specifies the type of the parameter: • A Boolean parameter accepts either <code>true</code> or <code>false</code> as its value. • A string parameter accepts any sequence of characters as its value, subject to the syntax for the parameter. • An integer parameter accepts a 4-byte value that can range from 0 to $2^{32} - 1$. • A parameter file parameter accepts an initialization parameter file specification as its value. • A big integer parameter accepts an 8-byte value that can range from 0 to $2^{64} - 1$. You specify a value for a big integer as an integer together with an optional modifier such as K, M, or G, which respectively denotes kilobytes, megabytes, or gigabytes. For example, 1000, 100 KB, 50 MB and 2 GB are valid specifications for big integers.
Syntax	For string and big integer parameters, specifies the valid syntax for specifying the parameter.
Default value	Specifies the value that the parameter assumes if a value is not explicitly specified. For most initialization parameters, the value that is documented for the Default value property is obtained by querying the <code>DEFAULT_VALUE</code> column in the <code>V\$PARAMETER</code> view for the parameter.

Property	Description
Modifiable	Specifies whether the parameter can be changed for the current session (by an <code>ALTER SESSION</code> statement) or for all sessions in the current instance (by an <code>ALTER SYSTEM</code> statement): • <code>ALTER SESSION</code> overrides the instance-wide setting of the parameter for the current session only. You can restore the instance-wide setting for that session only by issuing another <code>ALTER SESSION</code> statement. • <code>ALTER SYSTEM</code> can be used to change the value in the server parameter file (SPFILE) of any initialization parameter. Such a change takes effect only in subsequent instances. The parameter descriptions indicate only those parameters that can be modified for the current instance.
Modifiable in a PDB	Specifies whether the parameter can be modified in a PDB (Yes) or not (No). For most initialization parameters, the value that is documented for the Modifiable in a PDB property is obtained by querying the <code>ISPDB_MODIFIABLE</code> column in the <code>V\$PARAMETER</code> view for the parameter.
Range of values	Specifies the valid range of values that this parameter can assume, shown as a minimum and maximum value. Not applicable to all parameters.
Basic	Specifies whether the parameter is a basic initialization parameter or not.
Oracle RAC	Specifies how the values for this parameter must be specified for multiple instances in an Oracle Real Application Clusters environment. Not applicable to all parameters.

For each parameter, paragraphs following these details further describe the parameter and the effects of different settings.

**See Also:**

["V\\$PARAMETER"](#)

2.6 Initialization Parameter Descriptions

The remainder of this chapter describes the initialization parameters in alphabetical order.

Initialization parameter values apply to the entire database, not to an individual user, unless otherwise specified.

**Note:**

Parameters that have become obsolete are not documented.

 See Also:

- *Oracle Database Upgrade Guide* for information about obsolete parameters
- Your system release bulletins or other operating system-specific Oracle documentation

2.7 ACTIVE_INSTANCE_COUNT

`ACTIVE_INSTANCE_COUNT` enables you to designate one instance in a two-instance cluster as the primary instance and the other instance as the secondary instance. This parameter has no functionality in a cluster with more than two instances.

Property	Description
Parameter type	Integer
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	No
Range of values	1 or $\geq$ the number of instances in the cluster. (Values other than 1 have no effect on the active or standby status of any instances.)
Basic	No
Oracle RAC	You must set this parameter for every instance, and multiple instances must have the same value.

 Note:

The `ACTIVE_INSTANCE_COUNT` parameter is deprecated. It is retained for backward compatibility only.

When you set this parameter to 1, the first instance you start up becomes the primary instance and accepts client connections. The second instance starts up as a secondary instance and can accept client connections only if the first instance fails. In such an event, the secondary instance becomes the primary instance.

When the failed instance can once again be started up, it starts up as the secondary instance, and will not accept client connections unless the current primary instance fails.

 Note:

This parameter functions only in a cluster with only two instances.

2.8 ADG_ACCOUNT_INFO_TRACKING

ADG_ACCOUNT_INFO_TRACKING controls login attempts of users on Oracle Active Data Guard standby databases. It extends the control of user account security information.

Property	Description
Parameter type	String
Syntax	ADG_ACCOUNT_INFO_TRACKING = { LOCAL GLOBAL }
Default value	LOCAL
Modifiable	No
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	The same value must be used on all instances.

Setting ADG_ACCOUNT_INFO_TRACKING to **LOCAL** (the default value) continues to enforce the default behavior, by maintaining a local copy of users account information in the standby's in-memory view. Login failures are only tracked locally on a per database basis, and login is denied when the failure maximum is reached.

Setting the parameter to **GLOBAL** triggers a more secure behavior, by maintaining a single global copy of users account information across all Data Guard databases (primary and standby). Login failures across all databases in the Data Guard configuration count towards the maximum count and logins anywhere will be denied when the count is reached. This setting improves security against login attacks across a production database and all Active Data Guard standby databases.

2.9 ADG_REDIRECT_DML

Use ADG_REDIRECT_DML to enable or disable automatic redirection of DML operations from a standby to the primary in Oracle Active Data Guard environments.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SYSTEM Can be modified at the session level with a special ALTER SESSION command. See details below.
Modifiable in a PDB	No
Range of values	true false
Basic	No
Oracle RAC	Different instances can use different values.

Automatic redirection of DML operations to the primary can be configured at the system level or the session level. The session level setting overrides the system level setting.

- To enable automatic redirection of DML operations to the primary at the system level, set ADG_REDIRECT_DML to true.

- To disable automatic redirection of DML operations to the primary at the system level, set `ADG_REDIRECT_DML` to `false`.
- To enable automatic redirection of DML operations from a standby to the primary for the current session, issue the following SQL statement:

```
ALTER SESSION ENABLE ADG_REDIRECT_DML;
```

- To disable automatic redirection of DML operations from a standby to the primary for the current session, issue the following SQL statement:

```
ALTER SESSION DISABLE ADG_REDIRECT_DML;
```

 See Also:

Oracle Data Guard Concepts and Administration for more information about automatic redirection of DML operations

2.10 ALLOW_GLOBAL_DBLINKS

`ALLOW_GLOBAL_DBLINKS` specifies whether LDAP lookup for database links is allowed for the database.

Property	Description
Parameter type	Boolean
Syntax	<code>ALLOW_GLOBAL_DBLINKS = { FALSE TRUE }</code>
Default value	<code>FALSE</code>
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	No
Basic	No
Oracle RAC	The same value must be used on all instances.

The following values can be set:

- `FALSE`: LDAP lookup for a database link's definition is not allowed for the database.
- `TRUE`: LDAP lookup for a database link's definition is allowed for the database.

2.11 ALLOW_GROUP_ACCESS_TO_SGA

`ALLOW_GROUP_ACCESS_TO_SGA` controls group access to shared memory on UNIX platforms.

Property	Description
Parameter type	Boolean
Default value	<code>false</code>
Modifiable	No
Modifiable in a PDB	No

Property	Description
Range of values	true false
Basic	No
Oracle RAC	The same value must be used on all instances.

The default value is `false`, which means that database shared memory is created with `owner` access only. In Oracle Database releases prior to Oracle Database 12c Release 2 (12.2.0.1), database shared memory was created with `owner` and `group` access.

When this parameter is set to `true`, database shared memory is created with `owner` and `group` access. This behavior grants permissions to DBAs to manage shared memory outside the database, but also allows DBAs to read and write to shared memory, which may not be desirable for certain installations.

2.12 ALLOW_LEGACY_RECO_PROTOCOL

`ALLOW_LEGACY_RECO_PROTOCOL` specifies whether the distributed transactions recovery process RECO uses a legacy recovery protocol or an upgraded recovery protocol.

Property	Description
Parameter type	Boolean
Default value	true
Modifiable	No
Modifiable in a PDB	No
Range of values	true false
Basic	No
Oracle RAC	All instances must use the same value.

By default, `ALLOW_LEGACY_RECO_PROTOCOL` is set to `true`, which instructs RECO to use the legacy recovery protocol available in releases prior to Oracle Database 23ai.

Setting this parameter to `false` instructs RECO to use an upgraded recovery protocol. In this case, all databases involved in distributed transactions must run Oracle Database 23ai or later. If you set this parameter to `false` and a pre-Oracle Database 23ai database is involved in a distributed transaction, the distributed transaction recovery will fail. To ensure that distributed transaction recovery will complete successfully, the `ALLOW_LEGACY_RECO_PROTOCOL` must remain set to `true` until all databases are upgraded to at least Oracle Database 23ai.

Note:

This parameter is available starting with Oracle Database 23ai.

See Also:

Oracle Database Administrator's Guide for more information about this parameter

2.13 ALLOW_ROWID_COLUMN_TYPE

ALLOW_ROWID_COLUMN_TYPE determines whether table columns of data type ROWID are allowed to be created.

Note:

This parameter is valid only for Oracle Autonomous Database on dedicated Exadata infrastructure. On other types of Oracle databases, the value of this parameter is ignored and ROWID columns are always allowed to be created.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No
Oracle RAC	Multiple instances should use the same value

Values:

- false

Columns of data type ROWID are not allowed.

You cannot specify ROWID columns when creating tables, nor can you add ROWID columns to existing tables. If the value of this parameter is changed from true to false at a time when ROWID columns exist in the database, then those columns are allowed to remain. However, Oracle recommends that you leave this parameter set to its default value of false and avoid introducing ROWID columns into Oracle Autonomous Database on dedicated Exadata infrastructure.

- true

Columns of data type ROWID are allowed.

If you choose this setting, be aware that ROWID columns are incompatible with rolling upgrade operations and other internal operations that physically move table rows. At a minimum, database activities involving ROWID columns should be suspended during upgrades. Applications using ROWID columns should introduce correctness validation to mitigate against logical errors in the application if a row relocates.

2.14 APPROX_FOR_AGGREGATION

`APPROX_FOR_AGGREGATION` replaces exact query processing for aggregation queries with approximate query processing.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No
Oracle RAC	Different instances can use different values.

Data analysis applications heavily use aggregate function and analytic function queries. Aggregation functions and analytic functions require sorting of large volumes of data, and exact query answering requires lots of memory, and can be time consuming. With approximate query processing, the results of aggregate function and analytic function queries are returned much faster than with exact query processing. Approximate query processing is useful for situations where a tolerable amount of error is acceptable in order to obtain faster query results.

The values that can be set are:

- `false`:
Approximate query processing is not used for aggregation queries and analytic queries.
- `true`: Approximate query processing is used for aggregation queries and analytic queries.

See Also:

- ["APPROX_FOR_COUNT_DISTINCT"](#)
- ["APPROX_FOR_PERCENTILE"](#)

2.15 APPROX_FOR_COUNT_DISTINCT

`APPROX_FOR_COUNT_DISTINCT` automatically replaces `COUNT (DISTINCT expr)` queries with `APPROX_COUNT_DISTINCT` queries.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false

Property	Description
Basic	No
Oracle RAC	Different instances can use different values.

Query results for `APPROX_COUNT_DISTINCT` queries are returned faster than the equivalent `COUNT (DISTINCT expr)` queries. `APPROX_COUNT_DISTINCT` queries are useful for situations where a tolerable amount of error is acceptable in order to obtain faster query results than with a `COUNT (DISTINCT expr)` query.

See Also:

- ["APPROX_FOR_AGGREGATION"](#)
- ["APPROX_FOR_PERCENTILE"](#)

2.16 APPROX_FOR_PERCENTILE

`APPROX_FOR_PERCENTILE` converts exact percentile functions to their approximate percentile function counterparts.

Property	Description
Parameter type	String
Syntax	<code>APPROX_FOR_PERCENTILE = { NONE PERCENTILE_CONT PERCENTILE_CONT DETERMINISTIC PERCENTILE_DISC PERCENTILE_DISC DETERMINISTIC ALL ALL DETERMINISTIC }</code>
Default value	none
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Different instances can use different values.

Approximate percentile function queries are faster than their exact percentile function query counterparts, so they can be useful in situations where a tolerable amount of error is acceptable in order to obtain faster query results.

The values that can be set are:

- **NONE:**
No queries are converted. This is the default value.
- **PERCENTILE_CONT:**
Converts `PERCENTILE_CONT` queries to `APPROX_PERCENTILE` queries.
- **PERCENTILE_CONT DETERMINISTIC:**
Converts `PERCENTILE_CONT` queries to `APPROX_PERCENTILE DETERMINISTIC` queries.
- **PERCENTILE_DISC:**

Converts PERCENTILE_DISC queries to APPROX_PERCENTILE queries.

- PERCENTILE DISC DETERMINISTIC:

Converts PERCENTILE_DISC queries to APPROX_PERCENTILE DETERMINISTIC queries.

- ALL:

Converts both PERCENTILE_CONT queries and PERCENTILE_DISC queries to APPROX_PERCENTILE queries.

- ALL DETERMINISTIC:

Converts both PERCENTILE_CONT and PERCENTILE_DISC queries to APPROX_PERCENTILE DETERMINISTIC queries.

See Also:

- ["APPROX_FOR_AGGREGATION"](#)
- ["APPROX_FOR_COUNT_DISTINCT"](#)
- *Oracle Database SQL Language Reference* for information about APPROX_MEDIAN aggregate functions
- *Oracle Database SQL Language Reference* for information about APPROX_PERCENTILE aggregate functions

2.17 AQ_TM_PROCESSES

AQ_TM_PROCESSES controls time monitoring on queue messages and controls processing of messages with delay and expiration properties specified.

Property	Description
Parameter type	Integer
Default value	1
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to 40
Basic	No

You do not need to specify a value for this parameter because Oracle Database automatically determines the number of processes and autotunes them, as necessary. Therefore, Oracle highly recommends that you leave the AQ_TM_PROCESSES parameter unspecified and let the system autotune.

The default value for AQ_TM_PROCESSES is used if the client does not explicitly set a value for the parameter in the `init.ora` file or using the `ALTER SYSTEM` statement.

**Note:**

If you want to disable the Queue Monitor Coordinator, then you must set `AQ_TM_PROCESSES` to 0 in your parameter file. Oracle strongly recommends that you do NOT set `AQ_TM_PROCESSES` to 0.

**See Also:**

Oracle Database Advanced Queuing User's Guide for more information about this parameter

2.18 ARCHIVE_LAG_TARGET

`ARCHIVE_LAG_TARGET` forces a log switch after the specified amount of time elapses.

Property	Description
Parameter type	Integer
Default value	0 (disabled)
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 or any integer in [60, 7200]
Basic	No
Oracle RAC	Multiple instances should use the same value

A 0 value disables the time-based thread advance feature; otherwise, the value represents the number of seconds. Values larger than 7200 seconds are not of much use in maintaining a reasonable lag in the standby database. The typical, or recommended value is 1800 (30 minutes). Extremely low values can result in frequent log switches, which could degrade performance; such values can also make the archiver process too busy to archive the continuously generated logs.

**See Also:**

Oracle Database Administrator's Guide for more information about setting this parameter

2.19 ASM_DISKGROUPS

`ASM_DISKGROUPS` specifies a list of disk group names that an Oracle ASM instance mounts at startup when the `ALTER DISKGROUP ALL MOUNT` statement is issued.

Property	Description
Parameter type	String
Syntax	ASM_DISKGROUPS = <i>diskgroup</i> [, <i>diskgroup</i>] ...
Default value	There is no default value.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	Comma-separated list of strings, up to 30 characters
Basic	No
Oracle RAC	Multiple instances can have different values.

**Note:**

This parameter may only be specified in an Oracle Automatic Storage Management (Oracle ASM) instance.

The Oracle ASM instance startup process executes `ALTER DISKGROUP ALL MOUNT` unless the `NOMOUNT` startup option is specified.

The `ASM_DISKGROUPS` parameter is dynamic. If you are using a server parameter file (SPFILE), then you do not have to manually alter the value of `ASM_DISKGROUPS` in most situations. Oracle ASM automatically adds a disk group to the parameter when the disk group is successfully created or mounted. Oracle ASM also automatically removes a disk group from the parameter when the disk group is dropped. However, the SPFILE is not updated on a manual dismount.

Issuing the `ALTER DISKGROUP...ALL MOUNT` or `ALTER DISKGROUP...ALL DISMOUNT` command does not affect the value of this parameter.

Supporting Up to 511 Disk Groups for an Oracle ASM Instance

In Oracle Database 12c Release 1 or later, Oracle ASM configurations support up to 511 disk groups. Oracle ASM configurations with Oracle Database releases before 12c Release 1 can only support up to 63 disk groups.

**See Also:**

Oracle Automatic Storage Management Administrator's Guide for more information about and examples of using this parameter

2.20 ASM_DISKSTRING

`ASM_DISKSTRING` specifies an operating system-dependent value used by Oracle ASM to limit the set of disks considered for discovery.

Property	Description
Parameter type	String

Property	Description
Syntax	<code>ASM_DISKSTRING = discovery_string [, discovery_string] ...</code>
Default value	The null string; Oracle Automatic Storage Management discovery finds all disks in an operating system-specific location to which the Oracle Automatic Storage Management instance has read/write access.
Modifiable	<code>ALTER SESSION</code> , <code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Multiple instances can have different values. Different nodes might see the same disks under different names; however, each instance must be able to use its <code>ASM_DISKSTRING</code> to discover the same physical media as the other nodes in the cluster.

 Note:

This parameter may only be specified in an Oracle Automatic Storage Management (Oracle ASM) instance.

When a new disk is added to a disk group, each Oracle ASM instance that has the disk group mounted must be able to discover the new disk using the value of `ASM_DISKSTRING`.

In most cases, the default value will be sufficient. Using a more restrictive value may reduce the time required for Oracle ASM to perform discovery, and thus improve disk group mount time or the time for adding a disk to a disk group. A "?" at the beginning of the string gets expanded to the Oracle home directory. Depending on the operating system, wildcard characters can be used. It may be necessary to dynamically change `ASM_DISKSTRING` before adding a disk so that the new disk will be discovered.

An attempt to dynamically modify `ASM_DISKSTRING` will be rejected and the old value retained if the new value cannot be used to discover a disk that is in a disk group that is already mounted.

 See Also:

Oracle Automatic Storage Management Administrator's Guide for more information and examples of using this parameter

2.21 ASM_IO_PROCESSES

`ASM_IO_PROCESSES` specifies the number of I/O worker processes to be started in an Oracle IOServer instance.

Property	Description
Parameter type	Integer
Default value	20
Modifiable	<code>ALTER SYSTEM</code>

Property	Description
Modifiable in a PDB	No
Range of values	1 – 32
Basic	No
Oracle RAC	Multiple instances can have different values.

This parameter is applicable only in an Oracle IOServer instance, which runs out of an Oracle Grid Infrastructure home.

The default value should work in most cases. However, under heavy I/O load, there may be some delays associated with posting processes out of I/O waits. In this case, a slightly higher value than the default may be appropriate.

2.22 ASM_POWER_LIMIT

`ASM_POWER_LIMIT` specifies the maximum power on an Oracle ASM instance for disk rebalancing.

Property	Description
Parameter type	Integer
Default value	1
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to 11 ¹
Basic	No
Oracle RAC	Multiple instances can have different values.

¹ Beginning with Oracle Database 11g Release 2 (11.2.0.2), if the `COMPATIBLE.ASM` disk group attribute is set to 11.2.0.2 or higher, then the range of values is 0 to 1024.

Note:

- This parameter may only be specified in an Oracle Automatic Storage Management (Oracle ASM) instance.
- In an Oracle Exadata or Oracle Data Appliance environment, you cannot set this parameter to 0.

The higher the limit, the faster rebalancing will complete. Lower values will take longer, but consume fewer processing and I/O resources.

If the `POWER` clause of a rebalance operation is not specified, then the default power will be the value of `ASM_POWER_LIMIT`.

**See Also:**

Oracle Automatic Storage Management Administrator's Guide for more information about using this parameter

2.23 ASM_PREFERRED_READ_FAILURE_GROUPS

ASM_PREFERRED_READ_FAILURE_GROUPS specifies the failure groups that contain preferred read disks. Preferred disks are instance specific.

Property	Description
Parameter type	String
Syntax	ASM_PREFERRED_READ_FAILURE_GROUPS = '<diskgroup_name>.<failure_group_name>, ...'
Default value	NULL
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No
Oracle RAC	The value is different on different nodes

**Note:**

The ASM_PREFERRED_READ_FAILURE_GROUPS initialization parameter is deprecated in Oracle Database 12c Release 2 (12.2.0.1) and may be desupported in a future release. It is replaced by the PREFERRED_READ.ENABLED disk group attribute.

See *Oracle Automatic Storage Management Administrator's Guide* for more information about the PREFERRED_READ.ENABLED disk group attribute.

To reset the parameter value to null, issue the following statement, which updates the server parameter file (SP file), then reboot Oracle ASM so that the change takes effect:

```
alter system reset asm_preferred_read_failure_groups;
```

**See Also:**

Oracle Automatic Storage Management Administrator's Guide for more information about this parameter

2.24 AUDIT_FILE_DEST

`AUDIT_FILE_DEST` specifies the operating system directory into which the audit trail is written when the `AUDIT_TRAIL` initialization parameter is set to **os**, **xml**, or **xml,extended**.

Note:

This parameter is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored. However, you cannot create new traditional audit settings. You can delete existing traditional audit settings. See *Oracle Database Security Guide* for more information about how this desupport works.

Property	Description
Parameter type	String
Syntax	<code>AUDIT_FILE_DEST = 'directory'</code>
Default value	The first default value is: <code>ORACLE_BASE/admin/ORACLE_SID/adump</code> The second default value, which is used if the first default value does not exist or is unusable, is: <code>ORACLE_HOME/rdbms/audit</code> Both of these default values are for UNIX systems. Other platforms may have different defaults. In a multitenant container database (CDB), both of these default values will be appended with the GUID of the pluggable database (PDB) to store audit records that belong to the PDB. For example, if the PDB's GUID is <code>03E1F908EE04252CE053B280E80AAAA3</code>, the first default directory will be: <code>ORACLE_BASE/admin/ORACLE_SID/adump/ 03E1F908EE04252CE053B280E80AAAA3</code> You can use the <code>V\$CONTAINERS</code> view to query a PDB's GUID.
Modifiable	<code>ALTER SYSTEM ... DEFERRED</code>
Modifiable in a PDB	No
Basic	No

The audit records will be written in XML format if the `AUDIT_TRAIL` initialization parameter is set to **xml** or **xml, extended**. It is also the location to which mandatory auditing information is written and, if so specified by the `AUDIT_SYS_OPERATIONS` initialization parameter, audit records for user `SYS`.

In a multitenant container database (CDB), the scope of the settings for this initialization parameter is the CDB. Although the audit trail is provided per pluggable database (PDB) in a CDB, this initialization parameter cannot be configured for individual PDBs.

 See Also:

- *Oracle Multitenant Administrator's Guide* for conceptual information about CDBs and PDBs
- *Oracle Multitenant Administrator's Guide* for information about managing CDBs and PDBs
- "V\$CONTAINERS"
- "V\$PDBS"

2.25 AUDIT_SYS_OPERATIONS

AUDIT_SYS_OPERATIONS enables or disables the auditing of directly issued user SQL statements with SYS authorization. These include SQL statements directly issued by users when connected with the SYSASM, SYSBACKUP, SYSDBA, SYSDG, SYSKM, or SYSOPER privileges, as well as SQL statements that have been executed with SYS authorization using the PL/SQL package DBMS_SYS_SQL.

 Note:

This parameter is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored. However, you cannot create new traditional audit settings. You can delete existing traditional audit settings. See *Oracle Database Security Guide* for more information about how this desupport works.

Property	Description
Parameter type	Boolean
Default value	FALSE
Modifiable	No
Modifiable in a PDB	No
Range of values	TRUE FALSE
Basic	No

The audit records are written to the operating system's audit trail. The audit records will be written in XML format if the AUDIT_TRAIL initialization parameter is set to xml or xml, extended

On UNIX platforms, if the AUDIT_SYSLOG_LEVEL parameter has also been set, then it overrides the AUDIT_TRAIL parameter and SYS audit records are written to the system audit log using the SYSLOG utility.

In a CDB, the scope of the settings for this initialization parameter is the CDB. Although the audit trail is provided per PDB in a CDB, this initialization parameter cannot be configured for individual PDBs.

2.26 AUDIT_SYSLOG_LEVEL

AUDIT_SYSLOG_LEVEL allows SYS and standard OS audit records to be written to the system audit log using the SYSLOG utility.

Note:

This parameter is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored. However, you cannot create new traditional audit settings. You can delete existing traditional audit settings. See *Oracle Database Security Guide* for more information about how this desupport works.

Property	Description
Parameter type	String
Syntax	AUDIT_SYSLOG_LEVEL = 'facility_clause.priority_clause'
Syntax	facility_clause::= { USER LOCAL[0 1 2 3 4 5 6 7] SYSLOG DAEMON KERN MAIL AUTH LPR NEWS UUCP CRON }
Syntax	priority_clause::= { NOTICE INFO DEBUG WARNING ERR CRIT ALERT EMERG }
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	No
Basic	No
Examples	AUDIT_SYSLOG_LEVEL = 'KERN.EMERG'; AUDIT_SYSLOG_LEVEL = 'LOCAL1.WARNING';

If you use this parameter, it is best to assign a file corresponding to every combination of facility and priority (especially KERN.EMERG) in `syslog.conf`. Sometimes these are assigned to print to the console in the default `syslog.conf` file. This can become annoying and will be useless as audit logs. Also, if you use this parameter, it is best to set the maximum length of syslog messages in the system to 512 bytes.

Note:

Audit records written to the system audit log could get truncated to 512 bytes, and different parts of the same audit record may not be joined to get the original complete audit record.

**See Also:**

Oracle Database Security Guide for information about configuring syslog auditing

If `AUDIT_SYSLOG_LEVEL` is set and SYS auditing is enabled (`AUDIT_SYS_OPERATIONS = TRUE`), then SYS audit records are written to the system audit log. If `AUDIT_SYSLOG_LEVEL` is set and standard audit records are being sent to the operating system (`AUDIT_TRAIL = os`), then standard audit records are written to the system audit log.

In a CDB, the scope of the settings for this initialization parameter is the CDB. Although the audit trail is provided per PDB in a CDB, this initialization parameter cannot be configured for individual PDBs.

2.27 AUDIT_TRAIL

`AUDIT_TRAIL` enables or disables database auditing.

**Note:**

This parameter is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored. However, you cannot create new traditional audit settings. You can delete existing traditional audit settings. See *Oracle Database Security Guide* for more information about how this desupport works.

Property	Description
Parameter type	String
Syntax	<code>AUDIT_TRAIL = { none os db [, extended] xml [, extended] }</code>
Default value	<code>none</code>
Modifiable	No
Modifiable in a PDB	No
Basic	No

Values

- `none`
Disables standard auditing. This value is the default if the `AUDIT_TRAIL` parameter was not set in the initialization parameter file or if you created the database using a method other than Database Configuration Assistant. If you created the database using Database Configuration Assistant, then the default is `db`.
- `os`
Directs all audit records to an operating system file. Oracle recommends that you use the `os` setting, particularly if you are using an ultra-secure database configuration.
- `db`

Directs audit records to the database audit trail (the `SYS.AUD$` table), except for records that are always written to the operating system audit trail. Use this setting for a general database for manageability.

If the database was started in read-only mode with `AUDIT_TRAIL` set to `db`, then Oracle Database internally sets `AUDIT_TRAIL` to `os`. Check the alert log for details.

- `db, extended`

Performs all actions of `AUDIT_TRAIL=db`, and also populates the SQL bind and SQL text CLOB-type columns of the `SYS.AUD$` table, when available. These two columns are populated only when this parameter is specified. When standard auditing is used with `DB`, `EXTENDED`, then virtual private database (VPD) predicates and policy names are also populated in the `SYS.AUD$` table.

If the database was started in read-only mode with `AUDIT_TRAIL` set to `db, extended`, then Oracle Database internally sets `AUDIT_TRAIL` to `os`. Check the alert log for details.

- `xml`

Writes to the operating system audit record file in XML format. Records all elements of the `AuditRecord` node except `Sql_Text` and `Sql_Bind` to the operating system XML audit file.

- `xml, extended`

Performs all actions of `AUDIT_TRAIL=xml`, and includes SQL text and SQL bind information in the audit trail.

You can use the SQL `AUDIT` statement to set auditing options regardless of the setting of this parameter.

In a CDB, the scope of the settings for this initialization parameter is the CDB. Although the audit trail is provided per PDB in a CDB, this initialization parameter cannot be configured for individual PDBs.

Examples

The following statement sets the `db, extended` value for the `AUDIT_TRAIL` parameter. The new value takes effect after the database is restarted.

```
SQL> alter system set AUDIT_TRAIL=db, extended scope=spfile;
```

System altered.

```
SQL>
```

The following statement sets the `xml, extended` value for the `AUDIT_TRAIL` parameter. The new value takes effect after the database is restarted.

```
SQL> alter system set AUDIT_TRAIL=xml, extended scope=spfile;
```

System altered.

```
SQL>
```

The following statement sets the `db` value for the `AUDIT_TRAIL` parameter. The new value takes effect after the database is restarted.

```
SQL> alter system set AUDIT_TRAIL=db scope=spfile;
```

System altered.

```
SQL>
```

 See Also:

- *Oracle Database Security Guide* for information about configuring unified audit policies
- *Oracle Database Upgrade Guide* to learn more about traditional non-unified auditing

2.28 AUTOTASK_MAX_ACTIVE_PDBS

`AUTOTASK_MAX_ACTIVE_PDBS` enables you to specify the maximum number of PDBs that can schedule automated maintenance tasks at the same time (during a maintenance window).

Property	Description
Parameter type	Integer
Default value	2
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to the number of PDBs in the CDB
Basic	No
Oracle RAC	The same value should be used on all instances.

This parameter only affects PDBs. The CDB\$ROOT container (CDB root) for a CDB can always schedule and run maintenance tasks during a maintenance window.

The default value is 2. Therefore, by default, two PDBs and the CDB root can run tasks at the same time during a maintenance window.

This parameter can be set only in the CDB root, not in a PDB.

 See Also:

- ["ENABLE_AUTOMATIC_MAINTENANCE_PDB"](#) for information on disabling or enabling the running of automated maintenance tasks for specific PDBs or for all the PDBs in CDB
- *Oracle Database Administrator's Guide* for more information about managing automated database maintenance tasks

2.29 AWR_PDB_AUTOFLUSH_ENABLED

`AWR_PDB_AUTOFLUSH_ENABLED` enables you to specify whether to enable or disable automatic Automatic Workload Repository (AWR) snapshots for all the PDBs in a CDB or for individual PDBs in a CDB.

Property	Description
Parameter type	Boolean
Default value	true
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No
Oracle RAC	The same value must be used on all instances.

Note:

The value of this parameter in `CDB$ROOT` (the root of a CDB) has no effect in the root. Automatic AWR snapshots are always enabled in the root, regardless of the setting of this parameter.

The default value of `AWR_PDB_AUTOFLUSH_ENABLED` is `true`. Thus, by default, automatic AWR snapshots are enabled for all the PDBs in a CDB.

When you change the value of `AWR_PDB_AUTOFLUSH_ENABLED` in the CDB root, the new value takes effect in all the PDBs in the CDB.

Therefore, if you change the value of `AWR_PDB_AUTOFLUSH_ENABLED` in the CDB root to `false`, the value of `AWR_PDB_AUTOFLUSH_ENABLED` is also changed to `false` in all of the PDBs, so that automatic AWR snapshots are disabled for all the PDBs.

You can also change the value of `AWR_PDB_AUTOFLUSH_ENABLED` in any of the individual PDBs in a CDB, and the value that is set for each individual PDB will be honored. This enables you to enable or disable automatic AWR snapshots for individual PDBs.

When a new PDB is created, or a PDB from a previous database release is upgraded to the current database release, automatic AWR snapshots are enabled or disabled for the PDB based on the current value of `AWR_PDB_AUTOFLUSH_ENABLED` in the root.

See Also:

- *Oracle Database Performance Tuning Guide* for more information about Automatic Workload Repository (AWR)
- *Oracle Database Performance Tuning Guide* for more information about AWR snapshots

2.30 AWR_PDB_MAX_PARALLEL_SLAVES

`AWR_PDB_MAX_PARALLEL_SLAVES` enables a DBA to allocate the correct amount of resources to enable quick and timely Automatic Workload Repository (AWR) flushes for multitenant container databases (CDBs).

Property	Description
Parameter type	Integer
Default value	10
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	1 – 30
Basic	No
Oracle RAC	Different instances can use different values.

Use `AWR_PDB_MAX_PARALLEL_SLAVES` to control the amount of resources dedicated to AWR snapshot flushing in pluggable databases (PDBs). With this parameter, a DBA can modify the maximum number of MMON worker processes (*Mnnn* background processes) that can concurrently be used to handle AWR flush operations for the entire CDB.

For CDBs with a large number of PDBs enabled to create automatic AWR snapshots, a DBA can increase this parameter to enable timely AWR flushing. For CDBs with a small number of PDBs enabled, the value of this parameter can be decreased to reduce the concurrency and the chance of performance spikes.

Note that this parameter is set in the root of a CDB and determines the maximum degree of parallelism used to create AWR automatic snapshots for PDBs.

See Also:

- "[AWR_PDB_AUTOFLUSH_ENABLED](#)" for information about enabling the automatic creation of AWR PDB snapshots
- *Oracle Database Performance Tuning Guide* for an introduction to AWR
- "[Background Processes](#)" for more information about the MMON and *Mnnn* background processes

2.31 AWR_SNAPSHOT_TIME_OFFSET

`AWR_SNAPSHOT_TIME_OFFSET` specifies an offset for the Automatic Workload Repository (AWR) snapshot start time.

Property	Description
Parameter type	Integer
Default value	There is no offset by default.

Property	Description
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 - 3599, or the special value 1000000
Basic	No
Oracle RAC	Multiple instances should use the same value

AWR snapshots normally start at the top of the hour (12:00, 1:00, 2:00, and so on). This parameter allows DBAs to specify an offset for the AWR snapshot start time.

This is a useful parameter to avoid CPU spikes from multiple instances all starting their AWR snapshots at the same time. If you have a large system with many instances on it (like many Exadata installations), and you are experiencing such CPU spikes, this parameter can be very useful.

The parameter is specified in seconds. Normally, you set it to a value less than 3600. If you set the special value 1000000 (1,000,000), you get an automatic mode, in which the offset is based on the database name.

The automatic mode is an effective way of getting a reasonable distribution of offset times when you have a very large number of instances running on the same node.

2.32 BACKGROUND_CORE_DUMP

`BACKGROUND_CORE_DUMP` specifies whether Oracle includes the SGA in the core file for Oracle background processes.

Property	Description
Parameter type	String
Syntax	<code>BACKGROUND_CORE_DUMP = { partial full }</code>
Default value	<code>partial</code>
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

Values

- `partial`
Oracle does not include the SGA in the core dump.
- `full`
Oracle includes the SGA in the core dump.

See Also:

["SHADOW_CORE_DUMP"](#)

2.33 BACKGROUND_DUMP_DEST

BACKGROUND_DUMP_DEST specifies the pathname (directory or disc) where debugging trace files for the background processes (LGWR, DBWn, and so on) are written during Oracle operations.

Property	Description
Parameter type	String
Syntax	BACKGROUND_DUMP_DEST = { <i>pathname</i> <i>directory</i> }
Default value	Operating system-dependent
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	Any valid local path, directory, or disk
Basic	No

Note:

The BACKGROUND_DUMP_DEST parameter is deprecated in Oracle Database 12c Release 1 (12.1.0.1).

An **alert log** in the directory specified by BACKGROUND_DUMP_DEST logs significant database events and messages. Anything that affects the database instance or global database is recorded here. The alert log is a normal text file. Its file name is operating system-dependent. For platforms that support multiple instances, it takes the form `alert_sid.log`, where *sid* is the system identifier. This file grows slowly, but without limit, so you might want to delete it periodically. You can delete the file even when the database is running.

Note:

This parameter is ignored by the diagnosability infrastructure introduced in Oracle Database 11g Release 1 (11.1), which places trace and core files in a location controlled by the DIAGNOSTIC_DEST initialization parameter.

See Also:

- *Oracle Database Administrator's Guide* for more information on the DIAGNOSTIC_DEST initialization parameter
- "[USER_DUMP_DEST](#)" for information on setting a destination for server process trace files

2.34 BACKUP_TAPE_IO_SLAVES

BACKUP_TAPE_IO_SLAVES specifies whether I/O server processes are used by Recovery Manager to back up, copy, or restore data to tape.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SYSTEM ... DEFERRED
Modifiable in a PDB	No
Range of values	true false
Basic	No

When the value is set to `true`, Oracle uses an I/O server process to write to or read from a tape device. When the value is set to `false` (the default), Oracle does not use I/O server process for backups. Instead, the shadow process engaged in the backup accesses the tape device.

Note:

You cannot perform duplexed backups unless you enable this parameter. Otherwise, Oracle returns an error. When this parameter is enabled, Recovery Manager will configure as many server processes as needed for the number of backup copies requested.

See Also:

- *Oracle Database Backup and Recovery User's Guide* for more information on duplexed backups
- ["DBWR_IO_SLAVES"](#)

2.35 BITMAP_MERGE_AREA_SIZE

BITMAP_MERGE_AREA_SIZE specifies the amount of memory Oracle uses to merge bitmaps retrieved from a range scan of the index.

Property	Description
Parameter type	Integer
Default value	1048576 (1 MB)
Modifiable	No
Modifiable in a PDB	Yes

Property	Description
Range of values	Operating system-dependent
Basic	No

**Note:**

Oracle does not recommend using the `BITMAP_MERGE_AREA_SIZE` parameter unless the instance is configured with the shared server option. Oracle recommends that you enable automatic sizing of SQL working areas by setting `PGA_AGGREGATE_TARGET` instead. `BITMAP_MERGE_AREA_SIZE` is retained for backward compatibility.

`BITMAP_MERGE_AREA_SIZE` is relevant only for systems containing bitmap indexes. A larger value usually improves performance, because the bitmap segments must be sorted before being merged into a single bitmap.

**See Also:**

Oracle Database SQL Tuning Guide for more information on using bitmap indexes for performance

2.36 BLANK_TRIMMING

`BLANK_TRIMMING` specifies the data assignment semantics of character datatypes.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	No
Modifiable in a PDB	Yes
Range of values	true false
Basic	No

Values

- TRUE

Allows the data assignment of a source character string or variable to a destination character column or variable even though the source length is longer than the destination length. In this case, however, the additional length over the destination length must be all blanks, else an exception condition is raised. This value complies with the semantics of SQL-92 Transitional Level and above.

- FALSE

Disallows the data assignment if the source length is longer than the destination length and reverts to SQL92 Entry Level semantics.

**See Also:**

Oracle Database Globalization Support Guide for more information on how using this parameter can help prevent data truncation issues during character set migration

2.37 BLOCKCHAIN_TABLE_MAX_NO_DROP

`BLOCKCHAIN_TABLE_MAX_NO_DROP` lets you control the maximum amount of idle time that can be specified when creating a blockchain table or an immutable table. The idle time represents the length of time the table must be inactive before it can be dropped. When explicitly set by a user, the only value allowed for this parameter is 0.

Property	Description
Parameter type	Integer
Default value	None
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	None or 0
Basic	No
Oracle RAC	The same value must be used on all instances.

When creating a blockchain table or an immutable table with the SQL statement `CREATE TABLE`, you can specify the clause `NO DROP UNTIL number DAYS IDLE`. This clause specifies the number of days the table must be inactive before it can be dropped, that is, the number of days that must pass after the most recent row insertion before the table can be dropped.

- If `BLOCKCHAIN_TABLE_MAX_NO_DROP` is set to 0, then when a user creates a blockchain table or an immutable table, and specifies the `NO DROP UNTIL number DAYS IDLE` clause, the value of *number* must be 0:

```
CREATE BLOCKCHAIN TABLE ... NO DROP UNTIL 0 DAYS IDLE ...  
CREATE IMMUTABLE TABLE ... NO DROP UNTIL 0 DAYS IDLE ...
```

This allows the table to be dropped at any time, regardless of how long the table has been inactive.

- If `BLOCKCHAIN_TABLE_MAX_NO_DROP` is not set, then when a user creates a blockchain table or an immutable table, and specifies the `NO DROP UNTIL number DAYS IDLE` clause, any number value can be specified for *number*.

**See Also:**

Oracle Database SQL Language Reference for information about the `CREATE TABLE` statement

2.38 BLOCKCHAIN_TABLE_RETENTION_THRESHOLD

`BLOCKCHAIN_TABLE_RETENTION_THRESHOLD` lets you control the maximum amount of idle time that can be specified when a database user without the `TABLE RETENTION` system privilege creates or alters a blockchain table or an immutable table.

Property	Description
Parameter type	Integer
Default value	16
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to 365,000
Basic	No
Oracle RAC	The same value must be used on all instances.

The idle time for a non-empty blockchain table or a non-empty immutable table represents the length of time (in days) the table must be inactive before it can be dropped.

Note:

This parameter is available starting with Oracle Database 23ai.

2.39 CIRCUITS

`CIRCUITS` specifies the total number of virtual circuits that are available for inbound and outbound network sessions.

Property	Description
Parameter type	Integer
Default value	4294967295
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

It is one of several parameters that contribute to the total SGA requirements of an instance.

You should not specify a value for this parameter unless you want to limit the number of virtual circuits.

**See Also:**

- *Oracle Database Concepts* for more information on memory structures
- *Oracle Database Concepts* for more information on processes

2.40 CLIENT_RESULT_CACHE_LAG

`CLIENT_RESULT_CACHE_LAG` specifies the maximum time (in milliseconds) since the last round trip to the server, before which the OCI client query execute makes a round trip to get any database changes related to the queries cached on the client.

Property	Description
Parameter type	Big integer
Syntax	<code>CLIENT_RESULT_CACHE_LAG = integer</code>
Default value	3000
Modifiable	No
Modifiable in a PDB	Yes
Range of values	0 to operating system-dependent
Basic	No

**See Also:**

Oracle Call Interface Developer's Guide for more information about the client query cache feature

2.41 CLIENT_RESULT_CACHE_SIZE

`CLIENT_RESULT_CACHE_SIZE` specifies the maximum size of the client per-process result set cache (in bytes).

Property	Description
Parameter type	Big integer
Syntax	<code>CLIENT_RESULT_CACHE_SIZE = integer [K M G]</code>
Default value	0
Modifiable	No
Modifiable in a PDB	Yes
Range of values	0 to operating system-dependent
Basic	No

All OCI client processes inherit this maximum size. Setting a nonzero value enables the client query cache feature. This can be overridden by the client configuration parameter `OCI_RESULT_CACHE_MAX_SIZE`.

**See Also:**

Oracle Call Interface Developer's Guide for more information about the client query cache feature

2.42 CLIENT_STATISTICS_LEVEL

`CLIENT_STATISTICS_LEVEL` controls whether database clients report network statistics to the database.

This parameter applies only to clients that use Oracle Call Interface (OCI) to connect to the database.

Property	Description
Parameter type	String
Syntax	<code>CLIENT_STATISTICS_LEVEL = { TYPICAL OFF }</code>
Default value	TYPICAL
Modifiable	<code>ALTER SYSTEM ... DEFERRED</code>
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	The same value must be used on all instances.

Database clients sometimes have performance issues when interacting with the database over a network (LAN or WAN). You can use this parameter to enable clients to collect network statistics and periodically send them to the database, where the statistics are displayed in `AWR` and `V$` views. These statistics include TCP and SQL*Net statistics. They complement existing database statistics and can be used to analyze, troubleshoot, and tune potential network performance or configuration issues.

Possible values:

- TYPICAL

This setting enables clients to collect network statistics and periodically send them to the database.

- OFF

This setting disables this feature. Clients will not send network statistics to the database.

When you modify this parameter, the new setting applies only to subsequent new connections to database clients.

**Note:**

To view a complete listing of the statistics that are collected and reported when this feature is enabled, issue the following SQL statement:

```
SELECT name FROM V$STATNAME
       WHERE name LIKE 'Client%' ORDER BY name;

NAME
-----
Client Advertised Receive Window
Client Advertised Send Window
Client Data Segments In
Client Data Segments Out
Client Lost Packets
Client Path Maximum Transmission Unit(MTU)
Client Send Congestion Window
Client Time (usec) Busy Sending Data
Client Time (usec) Busy Sending Data under Congestion
Client Time (usec) Last Ack Received
Client Time (usec) Last Ack Sent
Client Time (usec) Last Data Received
Client Time (usec) Last Data Sent
Client Time (usec) Limited by Receive Window
Client Time (usec) Limited by Send Buffer
Client Time (usec) Round Trip Time
Client Time (usec) Round Trip Time Variance
Client Total Bytes Acked
Client Total Bytes Received
Client Total Number of Retransmitted Packets
```

2.43 CLONEDB

CLONEDB should be set on Direct NFS Client CloneDB databases. When this parameter is set, the CloneDB database uses the database backup as the backing store for the datafiles.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	No
Modifiable in a PDB	No
Range of values	true false
Basic	No
Oracle RAC	The same value should be set for all instances.

**See Also:**

- See *Oracle Database Administrator's Guide* for more information about cloning databases on network attached storage (NAS).
- ["CLONEDB_DIR"](#)

2.44 CLONEDB_DIR

CLONEDB_DIR sets the directory path where CloneDB bitmap files should be created and accessed.

Property	Description
Parameter type	String
Syntax	CLONEDB_DIR = <i>string</i>
Default value	\$ORACLE_HOME/dbs
Modifiable	No
Modifiable in a PDB	No
Basic	No
Oracle RAC	In an Oracle RAC environment, this parameter should be set to a shared location that is accessible from all the instances.

By default the CloneDB bitmap file is created under the \$ORACLE_HOME/dbs directory. This directory may not be in a shared location in an Oracle RAC environment, and therefore this parameter is provided to identify a shared location where CloneDB specific files can be created.

**See Also:**

["CLONEDB"](#)

2.45 CLUSTER_DATABASE

CLUSTER_DATABASE is an Oracle RAC parameter that specifies whether Oracle RAC is enabled.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	No
Modifiable in a PDB	No
Range of values	true false
Basic	Yes
Oracle RAC	For all instances, the value must be set to true.

**See Also:**

Oracle Real Application Clusters Administration and Deployment Guide for an introduction to Oracle RAC

2.46 CLUSTER_INTERCONNECTS

CLUSTER_INTERCONNECTS can be used in Oracle Real Application Clusters environments to indicate cluster interconnects available for use for the database traffic.

Property	Description
Parameter type	String
Syntax	CLUSTER_INTERCONNECTS = <i>ifn</i> [: <i>ifn</i>] ...
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	No
Range of values	One or more IP addresses, separated by colons
Basic	No

Use this parameter to override the default interconnect configured for the database traffic, which is stored in the cluster registry. This procedure also may be useful with Data Warehouse systems that have reduced availability requirements and high interconnect bandwidth demands.

CLUSTER_INTERCONNECTS specifically overrides the following:

- Network classifications stored by `oifcfg` in the OCR.
- The default interconnect chosen by Oracle.

If you want to load-balance the interconnect, then Oracle recommends that you use link-bonding at the operating system level, even if you have two databases on the same server, so that multiple interconnects use the same address. Note that multiple private addresses provide load balancing, but do not provide failover unless bonded. If you specify multiple addresses in `init.ora` using CLUSTER_INTERCONNECTS, instead of bonding multiple addresses at the operating system level, then typically availability is reduced, because each network interface card failure will take down that instance.

Refer to your vendor documentation for information about bonding interfaces. Some vendor bonding architectures may require the use of this parameter.

If you have multiple database instances on Oracle Real Application Clusters nodes and want to use a specific interface for each instance, then you can set the CLUSTER_INTERCONNECTS initialization parameter to the IP address for each database instance. For example:

```
hr1.init.ora.cluster_interconnects="192.0.2.111"
oltp3.init.ora.cluster_interconnects="192.0.2.112"
```

If the Oracle RAC interconnect is configured to run on a different interface than the Oracle Clusterware interconnect, then this configuration can cause reduced availability, as failovers or instance evictions can be delayed if the Oracle RAC interconnect fails while the Oracle Clusterware NIC remains up.

**See Also:**

Oracle Real Application Clusters Administration and Deployment Guide for additional information about using `CLUSTER_INTERCONNECTS`

2.47 COMMIT_LOGGING

`COMMIT_LOGGING` is an advanced parameter used to control how redo is batched by Log Writer.

Property	Description
Parameter type	String
Syntax	<code>COMMIT_LOGGING = { IMMEDIATE BATCH }</code>
Default value	There is no default value.
Modifiable	Yes (at both session-level and system-level)
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Each instance may have its own setting

If `COMMIT_LOGGING` is altered after setting `COMMIT_WAIT` to `FORCE_WAIT`, then the `FORCE_WAIT` option is no longer valid.

2.48 COMMIT_POINT_STRENGTH

`COMMIT_POINT_STRENGTH` specifies a value that determines the **commit point site** in a distributed transaction.

Property	Description
Parameter type	Integer
Default value	1
Modifiable	No
Modifiable in a PDB	Yes
Range of values	0 to 255
Basic	No

**Note:**

This parameter is relevant only in distributed database systems.

The node in the transaction with the highest value for `COMMIT_POINT_STRENGTH` will be the commit point site.

The commit point site of a database should reflect the amount of critical shared data in the database. For example, a database on a mainframe computer typically shares more data

among users than one on a personal computer. Therefore, `COMMIT_POINT_STRENGTH` should be set to a higher value for the mainframe computer.

The commit point site stores information about the status of transactions. Other computers in a distributed transaction require this information during Oracle's two-phase commit, so it is desirable to have machines that are always available as commit point sites. Therefore, set `COMMIT_POINT_STRENGTH` to a higher value on your more available machines.

See Also:

- *Oracle Database Concepts* and *Oracle Database Administrator's Guide* for information on two-phase commit
- Your operating system-specific Oracle documentation for the default value of this parameter

2.49 COMMIT_WAIT

`COMMIT_WAIT` is an advanced parameter used to control when the redo for a commit is flushed to the redo logs.

Property	Description
Parameter type	String
Syntax	<code>COMMIT_WAIT = { NOWAIT WAIT FORCE_WAIT }</code>
Default value	There is no default value.
Modifiable	Yes (at both session-level and system-level)
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Each instance may have its own setting

Be aware that the `NOWAIT` option can cause a failure that occurs after the database receives the commit message, but before the redo log records are written. This can falsely indicate to a transaction that its changes are persistent. Also, it can violate the durability of ACID (Atomicity, Consistency, Isolation, Durability) transactions if the database shuts down unexpectedly.

If the parameter is set to `FORCE_WAIT`, the default behavior (immediate flushing of the redo log buffer with wait) is used. If this is a system setting, the session level and transaction level options will be ignored. If this is a session level setting, the transaction level options will be ignored. If `COMMIT_WAIT` is altered after it has been set to `FORCE_WAIT`, then the `FORCE_WAIT` option is no longer valid.

2.50 COMMIT_WRITE

`COMMIT_WRITE` is an advanced parameter used to control how redo for transaction commits is written to the redo logs.

Property	Description
Parameter type	String

Property	Description
Syntax	<code>COMMIT_WRITE = '{IMMEDIATE BATCH},{WAIT NOWAIT}'</code>
Default value	If this parameter is not explicitly specified, then database commit behavior defaults to writing commit records to disk before control is returned to the client. If only <code>IMMEDIATE</code> or <code>BATCH</code> is specified, but not <code>WAIT</code> or <code>NOWAIT</code>, then <code>WAIT</code> mode is assumed. If only <code>WAIT</code> or <code>NOWAIT</code> is specified, but not <code>IMMEDIATE</code> or <code>BATCH</code>, then <code>IMMEDIATE</code> mode is assumed. Be aware that the <code>NOWAIT</code> option can cause a failure that occurs after the database receives the commit message, but before the redo log records are written. This can falsely indicate to a transaction that its changes are persistent. Also, it can violate the durability of ACID (Atomicity, Consistency, Isolation, Durability) transactions if the database shuts down unexpectedly.
Modifiable	Yes (at both session-level and system-level). Values supplied for <code>COMMIT_WRITE</code> in an <code>ALTER SYSTEM</code> or <code>ALTER SESSION</code> statement must be separated by a comma.
Modifiable in a PDB	Yes
Range of values	Single-quoted, comma-separated list of either <code>IMMEDIATE</code> or <code>BATCH</code> , and either <code>WAIT</code> or <code>NOWAIT</code> .
Basic	No
Oracle RAC	Each instance may have its own setting

The `IMMEDIATE` and `BATCH` options control how redo is batched by Log Writer. The `WAIT` and `NOWAIT` options control when the redo for a commit is flushed to the redo logs.

Note:

The `COMMIT_WRITE` parameter is deprecated. It is retained for backward compatibility only. It is replaced by the `COMMIT_LOGGING` and `COMMIT_WAIT` parameters.

2.51 COMMON_USER_PREFIX

`COMMON_USER_PREFIX` specifies a prefix that the names of common users, roles, and profiles in a multitenant container database (CDB) must start with.

Property	Description
Parameter type	String
Syntax	<code>COMMON_USER_PREFIX = prefix</code>
Default value	In a CDB root, <code>C##</code> is the default value. In an application root, the empty string is the default value.
Modifiable	No
Modifiable in a PDB	No However, you can modify this parameter in an application root.
Basic	No

Property	Description
Oracle RAC	Multiple instances must have the same value

Names of local users, roles, and profiles must not start with the same prefix. A case-insensitive comparison of the prefixes for user, role, and profile names to the value of this parameter is done.

When a value is set for `COMMON_USER_PREFIX`, Oracle will require that the names of common users, roles, and profiles start with the string assigned to this parameter.

The names of users, roles, and profiles created using this prefix must be valid names.

Regardless of the value of the `COMMON_USER_PREFIX` parameter, the names of local users, roles, and profiles cannot start with `C##`. Similarly, the names of application common users and local users in an application PDB cannot start with `C##`.

 Caution:

You can change the value of the `COMMON_USER_PREFIX` parameter, but do so only with great care.

If `COMMON_USER_PREFIX` is set to an empty string, Oracle will *not* enforce any restrictions on the names of common or local users, roles, and profiles.

Setting this parameter to an empty string will result in no restrictions being placed on names of common and local users, roles, and profiles, which could lead to conflicts between the names of local and common users, roles, and profiles when a PDB is plugged into a different CDB, or when opening a PDB that was closed when a common user was created.

 Note:

`COMMON_USER_PREFIX` can be set in the context of an application container.

If you set `COMMON_USER_PREFIX` in the application root to a non-null value, then the application common user should start with that prefix, and a local user created in an application PDB cannot start with that prefix.

By default, `COMMON_USER_PREFIX` is the empty string in an application root.

 Note:

When you query the `V$PARAMETER` or `V$SYSTEM_PARAMETER` view, a value of `NONE` is returned for the `DEFAULT_VALUE` column for the `COMMON_USER_PREFIX` parameter.

However, the database enforces a default value of `C##` for a CDB root and a default value of the empty string for an application root.

 See Also:

- *Oracle Database SQL Language Reference* for information about valid user names
- *Oracle Database SQL Language Reference* for information about valid role names
- *Oracle Database SQL Language Reference* for information about valid profile names
- *Oracle Multitenant Administrator's Guide* for more information about the multitenant architecture

2.52 COMPATIBLE

`COMPATIBLE` enables you to use a new release of Oracle while ensuring the ability to downgrade the database to an earlier release.

Property	Description
Parameter type	String
Syntax	<code>COMPATIBLE = release_number</code>
Default value	Oracle Database 23ai (initial release): 23.4.0 Oracle Database 23ai, Release Update 23.5: 23.5.0 Oracle Database 23ai, Release Update 23.6: 23.6.0
Modifiable	No
Modifiable in a PDB	No
Range of values	19.0.0 to default release Values must be specified as at least three decimal numbers with each number separated by a dot, such as 23.4.0 or 23.4.0.0
Basic	Yes
Oracle RAC	Multiple instances must have the same value.

The `COMPATIBLE` parameter specifies the Oracle version number that the database disk format must be compatible with. The database can be downgraded to the version specified in the `COMPATIBLE` parameter or any later version.

Setting `COMPATIBLE` ensures that new features do not write data formats or structures to disk that are not compatible with the earlier release, preventing a future downgrade. Features that require a higher value of `COMPATIBLE` to work correctly may be restricted or disabled to ensure downgrades are possible.

Typically, users keep `COMPATIBLE` unchanged when upgrading their Oracle software. After upgrade, users will run the new release of the Oracle software for a few weeks to ensure that the new release is working correctly. Afterwards, users can choose to update `COMPATIBLE` to the latest version to take advantage of the new features.

The following Release Update guidelines apply:

- For Oracle Database 21c, Oracle Database 19c, and Oracle Database 18c:

The value of the `COMPATIBLE` parameter should not be changed for a Release Update (RU) or Release Update Revision (RUR). For example, assume you are running Oracle Database 21c and the value of `COMPATIBLE` is 21.0.0. You then apply Oracle Database 21c, Release Update 21.4. Do not set the value of `COMPATIBLE` to 21.4.0; leave it set to 21.0.0.

- For Oracle Database 23ai:

The value of the `COMPATIBLE` parameter should not be changed for an RUR. The value of the `COMPATIBLE` parameter should be changed for an RU only under the following circumstance: You are running the Oracle Database 23ai initial release and you have *explicitly* set `COMPATIBLE` to any value (including the default value of 23.4.0). You then apply a Release Update. In this case, if you apply Release Update 23.5, then you must set the value of `COMPATIBLE` to 23.5.0 in order to use all of the features of Oracle Database 23ai, or if you apply Release Update 23.6, then you must set the value of `COMPATIBLE` to 23.6.0 in order to use all of the features of Oracle Database 23ai.

Notes:

- The value of the `COMPATIBLE` parameter can be increased to a higher version, but it can never be decreased to a lower version.
- When using a standby database, this parameter must have the same value on both the primary and standby databases.

See Also:

Oracle Database Upgrade Guide for more information on setting this parameter

2.53 CONNECTION_BROKERS

`CONNECTION_BROKERS` is used to specify connection broker types, the number of connection brokers of each type, and the maximum number of connections per broker.

Property	Description
Parameter type	String
Syntax	<code>CONNECTION_BROKERS = broker_description[,...]</code>
Syntax	broker_description::= <code>((type_clause) (brokers_clause) [(broker_options)])</code>
Syntax	type_clause::= <code>TYPE={ DEDICATED EMON POOLED }</code> Indicates the broker type. This is a mandatory parameter.

Property	Description
Syntax	brokers_clause ::= <code>BROKERS=integer</code> Indicates the number of brokers of the specified type. This is a mandatory parameter. The specified integer value must be greater than or equal to 0. If set to 0, brokers will not accept new connections, but existing connections will continue as normal.
Syntax	broker_options ::= <code>CONNECTIONS=integer</code> The maximum number of connections per broker. This is an optional parameter. If the specified integer value is greater than the maximum allowed for the platform, the maximum allowed for the platform is used.
Default value	The default value for the initialization parameter will contain the <code>DEDICATED</code> and <code>EMON</code> broker types. Certain types of brokers are only started when certain features are enabled, so their configuration will only apply if the broker is needed.
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	No
Basic	No
Oracle RAC	The same value should be set on all instances

The connection brokers are used in these cases:

- `DEDICATED` brokers are used by the multiprocess and multithreaded Oracle features. See *Oracle Database Concepts* for more information about these features.

`DEDICATED` brokers are also used when the `USE_DEDICATED_BROKER` initialization parameter is set to `true`. See "[USE_DEDICATED_BROKER](#)" for more information about the `USE_DEDICATED_BROKER` initialization parameter.

- `EMON` brokers are used when there is a client registered for notification over 12c AQ queues. It is not on by default. See *Oracle Database Advanced Queuing User's Guide* for more information about AQ queues.
- `POOLED` brokers are used whenever a Database Resident Connection Pooling (DRCP) pool is active. See *Oracle Database Concepts* for more information about DRCP pooling.

The `POOLED` broker does not appear in the parameter by default. In this case, the DRCP fields are used. If you specify the `POOLED` broker in the parameter, then that specification will override the DRCP fields, and further attempts to set the DRCP fields will then throw an error. Oracle recommends that the parameter be used instead of the DRCP fields.

To make it easier to modify the list, individual entries are indexed using the `TYPE` so it is not necessary to re-specify the entire list. For example, to adjust the number of `DEDICATED` brokers:

```
alter system set connection_brokers = '((TYPE=DEDICATED) (BROKERS=2))'
```

2.54 CONTAINER_DATA

Use `CONTAINER_DATA` to control whether queries on extended data-linked objects from within a PDB return rows from both the root and the PDB, or rows from only the PDB.

Property	Description
Parameter type	String
Syntax	<code>CONTAINER_DATA = { ALL CURRENT CURRENT_DICTIONARY }</code>
Default value	ALL
Modifiable	ALTER SESSION
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Different instances can use different values.

This parameter controls the behavior of queries on the following types of objects:

- Extended data-linked application common objects

This type of object stores shared data in an application root, and also allows application PDBs to store local data that is unique to each application PDB.

When this type of object is queried from an application root, only the shared data in the application root is returned.

When this type of object is queried from an application PDB, the value of the `CONTAINER_DATA` initialization parameter controls the query result as follows:

 - ALL: The query returns both the shared data in the application root and the local data pertaining to the application PDB
 - CURRENT: The query returns only the local data pertaining to the application PDB
 - CURRENT_DICTIONARY: The query returns both the shared data in the application root and the local data pertaining to the application PDB
- Extended data-linked Oracle-supplied data dictionary objects

This type of object stores data pertaining to the CDB root, as well as data pertaining to individual PDBs.

When this type of object is queried from the CDB root, only data pertaining to the CDB root is returned.

When this type of object is queried from a PDB, the value of the `CONTAINER_DATA` initialization parameter controls the query result as follows:

 - ALL: The query returns data pertaining to both the CDB root and the PDB
 - CURRENT: The query returns only data pertaining to the PDB
 - CURRENT_DICTIONARY: The query returns only data pertaining to the PDB

2.55 CONTAINERS_PARALLEL_DEGREE

CONTAINERS_PARALLEL_DEGREE can be used to control the degree of parallelism of a query involving containers().

Property	Description
Parameter type	Integer
Default value	65535
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	Cannot be set to a value lower than 2 or higher than 65535.
Basic	No
Oracle RAC	Different values can be set on different instances.

The value of CONTAINERS_PARALLEL_DEGREE, if set, will override the default DOP for a containers() query.

By default, a containers() query uses a degree of parallelism equal to (1 + number of open PDBs) in the case of CDB root and (1 + number of open application PDBs) in the case of application root.

If the value of CONTAINERS_PARALLEL_DEGREE is lower than 65535, then this value is used as the degree of parallelism of a query involving containers(). Otherwise (when the value is 65535), the default degree of parallelism is (1 + number of open PDBs) or (1 + number of open application PDBs) as described above.

See Also:

- *Oracle Multitenant Administrator's Guide* for more information about CDB roots
- *Oracle Multitenant Administrator's Guide* for more information about application roots

2.56 CONTROL_FILE_RECORD_KEEP_TIME

CONTROL_FILE_RECORD_KEEP_TIME specifies the minimum number of days before a reusable record in the control file can be reused.

Property	Description
Parameter type	Integer
Default value	7 (days)
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to 365 (days)

Property	Description
Basic	No

In the event a new record must be added to a reusable section and the oldest record has not aged enough, the record section expands. If this parameter is set to 0, then reusable sections never expand, and records are reused as needed.

If the number of reusable records in the control file exceeds the circular reuse record limit `UB4MAXVAL`, then reusable records will be overwritten even if `CONTROL_FILE_RECORD_KEEP_TIME` has not elapsed. `UB4MAXVAL` is defined in the `oratypes.h` header file, which is found in the `public` directory. Its value may vary according to the operating system you are using.

Note:

This parameter applies only to records in the control file that are circularly reusable (such as archive log records and various backup records). It does not apply to records such as data file, tablespace, and redo thread records, which are never reused unless the corresponding object is dropped from the tablespace.

See Also:

- ["CONTROL_FILES"](#)
- *Oracle Database Backup and Recovery User's Guide* for more information about this parameter

2.57 CONTROL_FILES

`CONTROL_FILES` specifies one or more names of control files, separated by commas.

Property	Description
Parameter type	String
Syntax	<code>CONTROL_FILES = filename [, filename] ...</code> Note: The control file name can be an OMF (Oracle Managed Files) name. This occurs when the control file is re-created using the <code>CREATE CONTROLFILE REUSE</code> statement.
Default value	Operating system-dependent
Modifiable	No
Modifiable in a PDB	No
Range of values	1 to 8 filenames
Basic	Yes
Oracle RAC	Multiple instances must have the same value.

Every database has a **control file**, which contains entries that describe the structure of the database (such as its name, the timestamp of its creation, and the names and locations of its data files and redo files).

Oracle recommends that you multiplex multiple control files on different devices or mirror the file at the operating system level.

**See Also:**

Oracle Database Administrator's Guide for information about specifying control files at database creation

2.58 CONTROL_MANAGEMENT_PACK_ACCESS

CONTROL_MANAGEMENT_PACK_ACCESS specifies which of the Server Manageability Packs should be active.

Property	Description
Parameter type	String
Syntax	CONTROL_MANAGEMENT_PACK_ACCESS = { NONE DIAGNOSTIC DIAGNOSTIC+TUNING }
Default value	Enterprise Edition: DIAGNOSTIC+TUNING Oracle Database Free: DIAGNOSTIC+TUNING All other editions: NONE
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

The following packs are available:

- The **DIAGNOSTIC** pack includes AWR, ADDM, and so on.
- The **TUNING** pack includes SQL Tuning Advisor, SQLAccess Advisor, and so on.

A license for **DIAGNOSTIC** is required for enabling the **TUNING** pack.

Values

- **NONE**
Neither pack is available.
- **DIAGNOSTIC**
Only the **DIAGNOSTIC** pack is available.
- **DIAGNOSTIC+TUNING**
Both packs are available.

**See Also:**

Oracle Database Licensing Information User Manual

2.59 CORE_DUMP_DEST

CORE_DUMP_DEST specifies the directory where Oracle dumps core files.

Property	Description
Parameter type	String
Syntax	CORE_DUMP_DEST = <i>directory</i>
Default value	ORACLE_HOME/DBS
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

CORE_DUMP_DEST is primarily a UNIX parameter and may not be supported on your platform.

**Note:**

This parameter is ignored by the new diagnosability infrastructure introduced in Oracle Database 11g Release 1 (11.1), which places trace and core files in a location controlled by the DIAGNOSTIC_DEST initialization parameter.

**See Also:**

["DIAGNOSTIC_DEST"](#)

2.60 CPU_COUNT

CPU_COUNT specifies the number of CPUs available for Oracle Database to use.

Property	Description
Parameter type	String
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to unlimited
Basic	No
Oracle RAC	The same value should be used on all instances.

On CPUs with multiple CPU threads, it specifies the total number of available CPU threads. Various components of Oracle Database are configured based on the number of CPUs, such as the Optimizer, Parallel Query, and Resource Manager.

If `CPU_COUNT` is set to 0 (its default setting), then Oracle Database continuously monitors the number of CPUs reported by the operating system and uses the current count. If `CPU_COUNT` is set to a value other than 0, then Oracle Database will use this count rather than the actual number of CPUs, thus disabling dynamic CPU reconfiguration.

When Resource Manager is managing CPU (`RESOURCE_MANAGER_PLAN` is set), then the database's CPU utilization is limited to `CPU_COUNT` CPU threads. This feature is called Instance Caging. If Resource Manager is enabled at the CDB level, then the PDB's CPU utilization is limited to the PDB's `CPU_COUNT`.

**Note:**

Setting `CPU_COUNT` to a value greater than the current number of CPUs results in an error. However, if `CPU_COUNT` is set to a value greater than the current number of CPUs in the initialization parameter file, then `CPU_COUNT` is capped to the current number of CPUs.

**Note:**

When a value is not explicitly set for `CPU_COUNT`, the maximum default value for `CPU_COUNT` is 2 for an Oracle ASM Proxy instance, 4 for an Oracle ASM instance, and 8 for an Oracle IO Server instance.

**See Also:**

- "`CPU_MIN_COUNT`"
- *Oracle Database VLDB and Partitioning Guide* for information about how `CPU_COUNT` is used to determine the default degree of parallelism for a single instance or Oracle RAC configuration when the `PARALLEL` clause is specified but no degree of parallelism is listed
- *Oracle Database Administrator's Guide* for an example of how CPU resources are allocated if you enable instance caging and set a maximum utilization limit in a resource plan

2.61 CPU_MIN_COUNT

`CPU_MIN_COUNT` specifies the minimum number of CPUs required by a pluggable database (PDB) at any given time.

Property	Description
Parameter type	String

Property	Description
Syntax	<code>CPU_MIN_COUNT = 'value'</code>
Default value	The value of <code>CPU_COUNT</code>
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Range of Values	Decimal values from 0.1 through 0.95, where the decimal value is a multiple of 0.05 Integer values from 1 up to and including the value of <code>CPU_COUNT</code>
Basic	No
Oracle RAC	The same value should be used on all instances.

This parameter specifies the minimum number of CPUs required by a PDB at any given time. For multi-threaded CPUs, this number corresponds to CPU threads, not CPU cores.

You can set this parameter at the CDB level, and for each individual PDB. This enables you to control each PDB's minimum share of CPU utilization within a CDB. If the sum of the `CPU_MIN_COUNT` values across all open PDBs in a CDB is equal to the value of `CPU_MIN_COUNT` for the CDB, then the CDB instance is considered full. If the sum exceeds the value of `CPU_MIN_COUNT` for the CDB, then the CDB instance is over-provisioned. Oracle does not prevent you from over-provisioning a CDB.

Resource Manager is enabled at the CDB level by setting the `RESOURCE_MANAGER_PLAN` at the root level to the name of a CDB resource plan. If the CDB resource plan has no configured CPU directives, that is, the `SHARES` and `UTILIZATION_LIMIT` directives are unset, then Resource Manager uses the `CPU_COUNT` and `CPU_MIN_COUNT` settings for the PDB to manage CPU utilization.

Note:

Setting this parameter to a very low value can result in insufficient CPU allocation and poor performance.

See Also:

"`CPU_COUNT`"

2.62 CREATE_BITMAP_AREA_SIZE

`CREATE_BITMAP_AREA_SIZE` specifies the amount of memory (in bytes) allocated for bitmap creation.

Property	Description
Parameter type	Integer
Default value	0

Property	Description
Modifiable	No
Modifiable in a PDB	Yes
Range of values	Operating system-dependent
Basic	No

This parameter is relevant only for systems containing bitmap indexes.

**Note:**

Oracle does not recommend using the `CREATE_BITMAP_AREA_SIZE` parameter unless the instance is configured with the shared server option. Oracle recommends that you enable automatic sizing of SQL working areas by setting `PGA_AGGREGATE_TARGET` instead. `CREATE_BITMAP_AREA_SIZE` is retained for backward compatibility.

A larger value may speed up index creation.

Cardinality is the number of unique values in a column in relation to the number of rows in the table. If cardinality is very small, you can set a small value for this parameter. For example, if cardinality is only 2, then the value can be in kilobytes rather than megabytes. As a general rule, the higher the cardinality, the more memory is needed for optimal performance.

**See Also:**

Oracle Database SQL Tuning Guide for more information on using bitmap indexes

2.63 CREATE_STORED_OUTLINES

`CREATE_STORED_OUTLINES` determines whether Oracle automatically creates and stores an outline for each query submitted during the session.

Property	Description
Parameter type	String
Syntax	<code>CREATE_STORED_OUTLINES = { true false category_name } [NOOVERRIDE]</code>
Default value	There is no default value.
Modifiable	<code>ALTER SESSION, ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Basic	No

Values

- `true`

Enables automatic outline creation for subsequent queries in the same session. These outlines receive a unique system-generated name and are stored in the `DEFAULT` category. If a particular query already has an outline defined for it in the `DEFAULT` category, then that outline will remain and a new outline will not be created.

- `false`

Disables automatic outline creation during the session. This is the default.

- `category_name`

Enables the same behavior as `true` except that any outline created during the session is stored in the `category_name` category.

- `NOOVERRIDE`

`NOOVERRIDE` specifies that this system setting will not override the setting for any session in which this parameter was explicitly set. If you do not specify `NOOVERRIDE`, then this setting takes effect in all sessions.

See Also:

Oracle Database SQL Tuning Guide for more information on setting this parameter

2.64 CURSOR_BIND_CAPTURE_DESTINATION

`CURSOR_BIND_CAPTURE_DESTINATION` determines the location at which bind variables that are captured from SQL cursors are available.

Property	Description
Parameter type	String
Syntax	<code>CURSOR_BIND_CAPTURE_DESTINATION = { off memory memory+disk }</code>
Default value	<code>memory+disk</code>
Modifiable	<code>ALTER SESSION, ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Basic	No

Values

- `off`

Bind variables are not captured from SQL cursors.

- `memory`

Bind variables are captured from SQL cursors, and are available only in memory (`v$` views).

- `memory+disk`

Bind variables are captured from SQL cursors, and are available in memory (`v$` views) and disk (Automatic Workload Repository tables, SQL Tuning Set tables, and so on).

When you specify this value with a SQL `ALTER SESSION` or `ALTER SYSTEM` statement, enclose the value in single quotes or double quotes. For example:

```
ALTER SESSION SET CURSOR_BIND_CAPTURE_DESTINATION = 'memory+disk';  
ALTER SYSTEM SET CURSOR_BIND_CAPTURE_DESTINATION = "memory+disk";
```

2.65 CURSOR_INVALIDATION

`CURSOR_INVALIDATION` controls whether deferred cursor invalidation or immediate cursor invalidation is used for DDL statements by default.

Property	Description
Parameter type	String
Syntax	<code>CURSOR_INVALIDATION = { DEFERRED IMMEDIATE }</code>
Default value	<code>IMMEDIATE</code>
Modifiable	<code>ALTER SESSION, ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Different instances can have different values.

Deferred invalidation reduces the number of cursor invalidations and spreads the recompilation workload over time. Note that when the recompilation workload is spread over time, a cursor may run with a sub-optimal plan until it is recompiled, and may incur small execution-time overhead.

Prior to Oracle Database 12c Release 2 (12.2.0.1), immediate cursor invalidation was used.

This parameter provides system or session level default for the `DEFERRED` or `IMMEDIATE` option for the `INVALIDATION` clause in DDL statements.

When this parameter is set to `DEFERRED`, an application can take advantage of reduced cursor invalidation without making any other application changes.

When this parameter is set to `IMMEDIATE`, the application will experience the same cursor invalidation behavior as in Oracle Database 12c Release 1 (12.1).

2.66 CURSOR_SHARING

`CURSOR_SHARING` determines what kind of SQL statements can share the same cursors.

Property	Description
Parameter type	String
Syntax	<code>CURSOR_SHARING = { EXACT FORCE }</code>
Default value	<code>EXACT</code>
Modifiable	<code>ALTER SESSION, ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Basic	No

Values

- `FORCE`

Allows the creation of a new cursor if sharing an existing cursor, or if the cursor plan is not optimal.

- `EXACT`

Only allows statements with identical text to share the same cursor.

See Also:

Oracle Database SQL Tuning Guide before setting the `CURSOR_SHARING` parameter to learn about the performance implications

2.67 CURSOR_SPACE_FOR_TIME

`CURSOR_SPACE_FOR_TIME` lets you use more space for cursors to save time.

Property	Description
Parameter type	Boolean
Default value	<code>false</code>
Modifiable	No
Modifiable in a PDB	No
Range of values	<code>true</code> <code>false</code>
Basic	No

Note:

The `CURSOR_SPACE_FOR_TIME` parameter is deprecated. It is retained for backward compatibility only.

This parameter affects both the shared SQL area and the client's private SQL area.

Most users will not need to set this parameter because of the significantly enhanced concurrency modifications introduced in Oracle Database 10g Release 2 (10.2.0.2) and later.

Values

- `true`

Shared SQL areas are kept pinned in the shared pool. As a result, shared SQL areas are not aged out of the pool as long as an open cursor references them. Because each active cursor's SQL area is present in memory, execution is faster. However, the shared SQL areas never leave memory while they are in use. Therefore, you should set this parameter to `true` only when the shared pool is large enough to hold all open cursors simultaneously.

In addition, a setting of `true` retains the private SQL area allocated for each cursor between executions instead of discarding it after cursor execution, saving cursor allocation and initialization time.

- `false`

Shared SQL areas can be deallocated from the library cache to make room for new SQL statements.

**Note:**

If this parameter is set to `true`, then the `SERIAL_REUSE` parameter is disabled.

**See Also:**

- ["SERIAL_REUSE"](#)

2.68 DATA_GUARD_MAX_IO_TIME

`DATA_GUARD_MAX_IO_TIME` sets the maximum number of seconds that can elapse before a process is considered hung while performing a regular I/O operation in an Oracle Data Guard environment. Regular I/O operations include read, write, and status operations.

**See Also:**

["DATA_GUARD_MAX_LONGIO_TIME"](#), which enables you to set the timeout for long I/O operations, such as open and close operations, in an Oracle Data Guard environment

Property	Description
Parameter type	Integer
Default value	240
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	10 to 7200
Basic	No
Oracle RAC	Different instances can use different values.

2.69 DATA_GUARD_MAX_LONGIO_TIME

`DATA_GUARD_MAX_LONGIO_TIME` sets the maximum number of seconds that can elapse before a process is considered hung while performing a long I/O operation in an Oracle Data Guard environment. Long I/O operations include open and close operations.

Property	Description
Parameter type	Integer
Default value	240
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	10 to 7200
Basic	No
Oracle RAC	Different instances can use different values.

See Also:

["DATA_GUARD_MAX_IO_TIME"](#)

2.70 DATA_GUARD_SYNC_LATENCY

`DATA_GUARD_SYNC_LATENCY` controls how many seconds the Log Writer (LGWR) process waits beyond the response of the first in a series of Oracle Data Guard SYNC redo transport mode connections.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to the number of seconds specified by the <code>NET_TIMEOUT</code> attribute for the <code>LOG_ARCHIVE_DEST_n</code> parameter
Basic	No
Oracle RAC	The same value must be used on all instances.

The default value is 0, which means that the LGWR will wait up to the number of seconds specified by the `NET_TIMEOUT` attribute of the `LOG_ARCHIVE_DEST_n` parameter for each SYNC standby destination.

For example, in an Oracle Data Guard configuration that has two standbys which receive redo in SYNC mode, you would define `LOG_ARCHIVE_DEST_2` and `LOG_ARCHIVE_DEST_3` to use SYNC transport with `DATA_GUARD_SYNC_LATENCY` set to a value of 2 seconds. When redo needs to be sent to the standbys, it is sent to both the `LOG_ARCHIVE_DEST_2` and `LOG_ARCHIVE_DEST_3` connections in parallel and the LGWR will wait for acknowledgement. If `LOG_ARCHIVE_DEST_2`

responds with its message acknowledging that the redo has been received first, the LGWR will not wait for LOG_ARCHIVE_DEST_3 to respond for more than 2 extra seconds (DATA_GUARD_SYNC_LATENCY). If LOG_ARCHIVE_DEST_3 does not respond within those 2 seconds the LGWR disconnects from LOG_ARCHIVE_DEST_3, putting it into the error state. Redo continues to be sent to LOG_ARCHIVE_DEST_2 as usual. After the duration of the REOPEN attribute for LOG_ARCHIVE_DEST_3 has elapsed, the LGWR reconnects to LOG_ARCHIVE_DEST_3 and redo transfer continues. In this manner, the maximum impact of having the second SYNC standby would be restricted to 2 seconds more than having only one SYNC standby, while allowing the Oracle Data Guard configuration to maintain the desired protection level.

LGWR will never wait longer than the value of the NET_TIMEOUT attribute of the LOG_ARCHIVE_DEST_n parameter, regardless of the value of DATA_GUARD_SYNC_LATENCY.

See Also:

"LOG_ARCHIVE_DEST_n"

2.71 DATA_TRANSFER_CACHE_SIZE

DATA_TRANSFER_CACHE_SIZE sets the size of the data transfer cache (in bytes) used to receive data blocks (typically from a primary database in an Oracle Data Guard environment) for consumption by an instance during execution of an RMAN RECOVER ... NONLOGGED BLOCK command.

Property	Description
Parameter type	Big integer
Syntax	DATA_TRANSFER_CACHE_SIZE = <i>integer</i> [K M G]
Default value	If SGA_TARGET is set, then if DATA_TRANSFER_CACHE_SIZE is not specified, the default size of the data transfer cache is 0 (internally determined by Oracle Database). If SGA_TARGET is set and DATA_TRANSFER_CACHE_SIZE is specified, then the user-specified value indicates the minimum value for the data transfer cache. If SGA_TARGET is not set, the data transfer cache will not be available.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 – 512M, rounded up to the next granule size
Basic	No
Oracle RAC	Multiple instances can have different values.

This initialization parameter needs to be set only for databases that do not use Automatic Memory Management and that use the RMAN RECOVER ... NONLOGGED BLOCK command.

2.72 DB_nK_CACHE_SIZE

DB_nK_CACHE_SIZE (where *n* = 2, 4, 8, 16, 32) specifies the size of the cache for the *nK* buffers.

Property	Description
Parameter type	Big integer
Syntax	DB_[2 4 8 16 32]K_CACHE_SIZE = <i>integer</i> [K M G]
Default value	0 (additional block size caches are not configured by default)
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	Minimum: 0 (values greater than zero are automatically modified to be either the granule size * number of processor groups, or 4 MB * number of CPUs, whichever is greater) Maximum: operating system-dependent
Basic	No

You can set this parameter only when `DB_BLOCK_SIZE` has a value other than *nK*. For example, if `DB_BLOCK_SIZE=4096`, then you cannot specify the parameter `DB_4K_CACHE_SIZE` (because the size for the 4 KB block cache is already specified by `DB_CACHE_SIZE`).

Do not set this parameter to zero if there are any online tablespaces with an *nK* block size.

Operating system-specific block size restrictions apply. For example, you cannot set `DB_32K_CACHE_SIZE` if the operating system's maximum block size is less than 32 KB. Also, you cannot set `DB_2K_CACHE_SIZE` if the minimum block size is greater than 2 KB.

See Also:

Your operating system-specific Oracle documentation for more information on block size restrictions

2.73 DB_BIG_TABLE_CACHE_PERCENT_TARGET

`DB_BIG_TABLE_CACHE_PERCENT_TARGET` specifies the cache section target size for automatic big table caching, as a percentage of the buffer cache.

Property	Description
Parameter type	String
Syntax	DB_BIG_TABLE_CACHE_PERCENT_TARGET = <i>string</i>
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No
Oracle RAC	Multiple instances can have different values, but it is recommended to keep the big table cache section size uniform.

Automatic big table caching enables parallel queries and serial queries to use the buffer cache, which enhances the in-memory query capabilities of Oracle Database. Automatic big table

caching is designed primarily to enhance performance for data warehouse workloads, but it also improves performance in mixed workloads.

Starting in Oracle Database 12c Release 1 (12.1.0.2), table scans can use a different algorithm in the following scenarios:

- Parallel queries:

In single-instance and Oracle Real Application Clusters (Oracle RAC) databases, parallel queries can use the automatic big table cache when the

`DB_BIG_TABLE_CACHE_PERCENT_TARGET` initialization parameter is set to a nonzero value, and the `PARALLEL_DEGREE_POLICY` initialization parameter is set to `AUTO` or `ADAPTIVE`.

- Serial queries:

In a single-instance configuration only, serial queries can use the automatic big table cache when the `DB_BIG_TABLE_CACHE_PERCENT_TARGET` initialization parameter is set to a nonzero value.

When a nonzero value is specified for the `DB_BIG_TABLE_CACHE_PERCENT_TARGET` parameter, the value indicates the percentage of the buffer cache to reserve for the big table cache. The largest value that can be specified with the `DB_BIG_TABLE_CACHE_PERCENT_TARGET` parameter is 90, which reserves 10% of the buffer cache for usage besides table scans.

The default value of this parameter is 0. Therefore, automatic big table caching is not enabled by default. When automatic big table caching is not enabled, queries might run using the least recently used (LRU) mechanism for cached reads, or might decide to use direct reads for the table scan.

If a large table is about the size of the combined size of the big table cache of all instances, the table will be partitioned and cached or mostly cached on all instances. With in-memory parallel query, this could eliminate most disk reads for queries on the table, or the database could intelligently read from disk only for the portion of the table that does not fit in the big table cache. If the big table cache cannot cache all the tables to be scanned, only the most frequently accessed tables will be cached, and the rest will be read via direct read automatically.

Use these guidelines when setting the parameter:

- If you do not enable automatic degree of parallelism (DOP) in your Oracle RAC environment, do not set this parameter because the big table cache is not used in that situation.
- When setting this parameter, consider the workload mix: how much of the workload is for OLTP; insert, update, and random access; and how much of the workload involves table scans. Because data warehouse workloads often perform large table scans, you may consider giving the big table cache section a higher percentage of buffer cache space for data warehouses.
- This parameter can be dynamically changed if the workload changes. The change could take some time to reach the target (depending on the current workload) because buffer cache memory might be actively used at that time.

**Note:**

Automatic big table caching uses temperature and object-based algorithms to track medium and big tables. Oracle will cache very small tables, but they will not be tracked by automatic big table caching.

 See Also:

- "PARALLEL_DEGREE_POLICY"
- See "V\$BT_SCAN_CACHE" and "V\$BT_SCAN_OBJ_TEMPS" for more information about the big table cache
- *Oracle Database VLDB and Partitioning Guide* for more information about this parameter and about automatic big table caching

2.74 DB_BLOCK_BUFFERS

DB_BLOCK_BUFFERS specifies the number of database buffers in the buffer cache.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	No
Modifiable in a PDB	No
Range of values	50 to an operating system-specific maximum
Basic	No
Oracle RAC	Multiple instances can have different values, and you can change the values as needed.

 Note:

DB_BLOCK_BUFFERS cannot be combined with the dynamic DB_CACHE_SIZE parameter; combining these parameters in the same parameter file will produce an error.

DB_BLOCK_BUFFERS is one of several parameters that contribute to the total memory requirements of the SGA of an instance.

This parameter, together with DB_BLOCK_SIZE, determines the total size of the buffer cache. Effective use of the buffer cache can greatly reduce the I/O load on the database. DB_BLOCK_SIZE can be specified only when the database is first created, so you use DB_BLOCK_BUFFERS to control the size of the buffer cache.

 Note:

The DB_BLOCK_BUFFERS initialization parameter is deprecated. It is maintained for backward compatibility.

Oracle recommends that you use DB_CACHE_SIZE instead.

**See Also:**`"DB_CACHE_SIZE"`

2.75 DB_BLOCK_CHECKING

`DB_BLOCK_CHECKING` specifies whether Oracle Database performs block checking for database blocks.

Property	Description
Parameter type	String
Syntax	<code>DB_BLOCK_CHECKING = { FALSE OFF LOW MEDIUM TRUE FULL }</code>
Default value	FALSE
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes, with the following restriction: If block checking is enabled for a CDB, then you cannot subsequently disable block checking in any of its PDBs. That is, if the value of <code>DB_BLOCK_CHECKING</code> in a CDB is <code>LOW</code> , <code>MEDIUM</code> , <code>TRUE</code> , or <code>FULL</code> , and you then attempt to set the value of <code>DB_BLOCK_CHECKING</code> in one of its PDBs to <code>FALSE</code> or <code>OFF</code> , an error will occur.
Basic	No

Values

- `OFF` or `FALSE`

No block checking is performed for blocks in user tablespaces. However, semantic block checking for `SYSTEM` tablespace blocks is always turned on.

- `LOW`

Basic block header checks are performed after block contents change in memory (for example, after `UPDATE`, `INSERT` or `DELETE` statements, or after inter-instance block transfers in Oracle RAC).

- `MEDIUM`

All `LOW` checks and full semantic checks are performed for all objects except indexes (whose contents can be reconstructed by a drop+rebuild on encountering a corruption).

- `FULL` or `TRUE`

All `LOW` and `MEDIUM` checks and full semantic checks are performed for all objects.

Oracle checks a block by going through the data in the block, making sure it is logically self-consistent. Block checking can often prevent memory and data corruption. Block checking typically causes 1% to 10% overhead in most applications, depending on workload and the parameter value. Specific DML overhead may be higher. The more updates or inserts in a workload, the more expensive it is to turn on block checking. You should set `DB_BLOCK_CHECKING` to `FULL` if the performance overhead is acceptable.

For backward compatibility, the use of `FALSE` (implying `OFF`) and `TRUE` (implying `FULL`) is preserved.

 Caution:

Before enabling block checking with this parameter, Oracle recommends that you detect and repair any logical corruptions in the database. Otherwise, a block that contains logical corruption will be marked as "soft corrupt" after block checking is enabled and the block is modified by a DML statement. This will result in `ORA-1578` errors and the block will be unreadable. For more information about detecting and repairing logical corruptions, see *Oracle Database Backup and Recovery User's Guide*.

 See Also:

Oracle Database Administrator's Guide for more information about this parameter

2.76 DB_BLOCK_CHECKSUM

`DB_BLOCK_CHECKSUM` determines whether `DBWn` and the direct loader will calculate a checksum (a number calculated from all the bytes stored in the block) and store it in the cache header of every data block when writing it to disk.

Property	Description
Parameter type	String
Syntax	<code>DB_BLOCK_CHECKSUM = { OFF FALSE TYPICAL TRUE FULL }</code>
Default value	<code>TYPICAL</code>
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	No
Basic	No

Checksums are verified when a block is read - only if this parameter is `TYPICAL` or `FULL` and the last write of the block stored a checksum. In `FULL` mode, Oracle also verifies the checksum before a change application from update/delete statements and recomputes it after the change is applied. In addition, Oracle gives every log block a checksum before writing it to the current log.

Most of the log block checksum is done by the generating foreground processes, while the LGWR or the LGWR worker processes (`LGnn` processes) perform the rest of the work, for better CPU and cache efficiency.

If this parameter is set to `OFF`, `DBWn` calculates checksums only for the `SYSTEM` tablespace, but not for user tablespaces. In addition, no log checksum is performed when this parameter is set to `OFF`.

Checksums allow Oracle to detect corruption caused by underlying disks, storage systems, or I/O systems. If set to `FULL`, `DB_BLOCK_CHECKSUM` also catches in-memory corruptions and stops

them from making it to the disk. Turning on this feature in `TYPICAL` mode causes only an additional 1% to 2% overhead. In the `FULL` mode it causes 4% to 5% overhead. Oracle recommends that you set `DB_BLOCK_CHECKSUM` to `TYPICAL`.

For backward compatibility the use of `TRUE` (implying `TYPICAL`) and `FALSE` (implying `OFF`) values is preserved.

**See Also:**

Oracle Database Backup and Recovery Reference for more information about this parameter

2.77 DB_BLOCK_SIZE

`DB_BLOCK_SIZE` specifies (in bytes) the size of Oracle database blocks.

Property	Description
Parameter type	Integer
Default value	8192
Modifiable	No
Modifiable in a PDB	No
Range of values	2048 to 32768, but your operating system may have a narrower range
Basic	Yes
Oracle RAC	You must set this parameter for every instance, and multiple instances must have the same value.

**Note:**

Set this parameter at the time of database creation. Do not alter it afterward.

Typical values for `DB_BLOCK_SIZE` are 4096 and 8192. The value of this parameter must be a multiple of the physical block size at the device level.

The value for `DB_BLOCK_SIZE` in effect at the time you create the database determines the size of the blocks. The value must remain set to its initial value.

For Oracle Real Application Clusters (Oracle RAC), this parameter affects the maximum value of the `FREELISTS` storage parameter for tables and indexes. Oracle uses one database block for each freelist group. Decision support system (DSS) and data warehouse database environments tend to benefit from larger block size values.

**Note:**

64-bit operating systems support a maximum `DB_BLOCK_SIZE` value of 32768

 See Also:

- *Oracle Database Administrator's Guide* for information on setting this parameter
- *Oracle Database SQL Language Reference* for information on freelist groups

2.78 DB_CACHE_ADVICE

DB_CACHE_ADVICE enables or disables statistics gathering used for predicting behavior with different cache sizes through the V\$DB_CACHE_ADVICE performance view.

Property	Description
Parameter type	String
Syntax	DB_CACHE_ADVICE = { ON READY OFF }
Default value	If STATISTICS_LEVEL is set to TYPICAL or ALL, then ON If STATISTICS_LEVEL is set to BASIC, then OFF
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

Values

- OFF
Advisory is turned off and the memory for the advisory is not allocated.
- READY
Advisory is turned off but the memory for the advisory remains allocated. Allocating the memory before the advisory is actually turned on avoids the risk of an error when you switch the parameter to ON.

If the parameter is switched to this state from ON, the contents of the view are preserved and the memory for the advisory is retained.

If the parameter is switched to this state from OFF, you may get an error.
- ON
Advisory is turned on. CPU and memory overheads are incurred. Attempting to set the parameter to this state when it is already in the OFF state may result in an error. Otherwise, the view (V\$DB_CACHE_ADVICE) is reset and statistics are gathered to the newly refreshed view.

If the parameter is in the READY state, you can set it to ON without any errors because the memory is already allocated. The view is reset and statistics are displayed in the newly refreshed view.

 See Also:

"V\$DB_CACHE_ADVICE"

2.79 DB_CACHE_SIZE

DB_CACHE_SIZE specifies the size of the DEFAULT buffer pool for buffers with the primary block size (the block size defined by the DB_BLOCK_SIZE initialization parameter).

Property	Description
Parameter type	Big integer
Syntax	DB_CACHE_SIZE = <i>integer</i> [K M G]
Default value	If SGA_TARGET is set: If the parameter is not specified, then the default is 0 (internally determined by the Oracle Database). If the parameter is specified, then the user-specified value indicates a minimum value for the memory pool. If SGA_TARGET is not set, then the default is either 48 MB or 4 MB * number of CPUs, whichever is greater
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No

The value must be at least 4M * number of cpus (smaller values are automatically rounded up to this value). A user-specified value larger than this is rounded up to the nearest granule size. A value of zero is invalid because it is needed for the DEFAULT memory pool of the primary block size, which is the block size for the SYSTEM tablespace.

 Note:

This parameter is optional for pluggable databases (PDBs). When this parameter is set for a PDB, it indicates a possible minimum value for the PDB usage of the memory pool.

To be able to use Resource Manager in a CDB to control the amount of memory each PDB can use:

- The `NONCDB_COMPATIBLE` initialization parameter must be set to `FALSE` at the CDB level (in the root of the CDB).
- The `MEMORY_TARGET` initialization parameter must not be set at the CDB level.
- If the `SGA_TARGET` initialization parameter is set at the CDB level, then the following requirement must be met:
 - The value of `DB_CACHE_SIZE` set in a PDB must be less than or equal to 50% of the `SGA_TARGET` value at the CDB level.
- If the `SGA_TARGET` initialization parameter is set at the PDB level, then the following requirement must be met:
 - The value of `DB_CACHE_SIZE` set in a PDB must be less than or equal to 50% of the `SGA_TARGET` value at the PDB level.
- If the `SGA_TARGET` initialization parameter is not set, but the `DB_CACHE_SIZE` initialization parameter is set at the CDB level, then the following requirement must be met:
 - The value of `DB_CACHE_SIZE` set in a PDB must be less than or equal to 50% of the `DB_CACHE_SIZE` value at the CDB level.

When you set `DB_CACHE_SIZE` in a PDB to a value that does not meet these requirements, you receive an error.

 See Also:

- *Oracle Database Performance Tuning Guide* and *Oracle Database Administrator's Guide* for more information on setting this parameter
- *Oracle Multitenant Administrator's Guide* for more information about the initialization parameters that control the memory usage of PDBs

2.80 DB_CREATE_FILE_DEST

`DB_CREATE_FILE_DEST` specifies the default location for Oracle-managed datafiles.

Property	Description
Parameter type	String
Syntax	<code>DB_CREATE_FILE_DEST = directory disk group</code>
Default value	There is no default value.

Property	Description
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	Yes

This location is also used as the default location for Oracle-managed control files and online redo logs if none of the `DB_CREATE_ONLINE_LOG_DEST_n` initialization parameters are specified.

If a file system directory is specified as the default location, then the directory must already exist; Oracle does not create it. The directory must have appropriate permissions that allow Oracle to create files in it. Oracle generates unique names for the files, and a file thus created is an Oracle Managed File.

 See Also:

Oracle Database Administrator's Guide for more information on setting this parameter and on Oracle Managed Files

2.81 DB_CREATE_ONLINE_LOG_DEST_n

`DB_CREATE_ONLINE_LOG_DEST_n` (where $n = 1, 2, 3, \dots 5$) specifies the default location for Oracle-managed control files and online redo logs.

Property	Description
Parameter type	String
Syntax	<code>DB_CREATE_ONLINE_LOG_DEST_[1 2 3 4 5] = directory disk group</code>
Default value	There is no default value.
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	Yes

If more than one `DB_CREATE_ONLINE_LOG_DEST_n` parameter is specified, then the control file or online redo log is multiplexed across the locations of the other `DB_CREATE_ONLINE_LOG_DEST_n` parameters. One member of each online redo log is created in each location, and one control file is created in each location.

Specifying at least two parameters provides greater fault tolerance for the control files and online redo logs if one of the locations should fail.

If a file system directory is specified as the default location, then the directory must already exist; Oracle does not create it. The directory must have appropriate permissions that allow Oracle to create files in it. Oracle generates unique names for the files, and a file thus created is an Oracle Managed File.

**See Also:**

Oracle Database Administrator's Guide for more information on setting this parameter and on Oracle Managed Files

2.82 DB_DOMAIN

In a distributed database system, `DB_DOMAIN` specifies the logical location of the database within the network structure.

Property	Description
Parameter type	String
Syntax	<code>DB_DOMAIN = domain_name</code>
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	Yes
Range of values	Any legal string of name components, separated by periods and up to 128 characters long (including the periods).
Basic	Yes
Oracle RAC	You must set this parameter for every instance, and multiple instances must have the same value.

You should set this parameter if this database is or ever will be part of a distributed system. The value consists of the extension components of a global database name, consisting of valid identifiers (any alphanumeric ASCII characters), separated by periods.

**Note:**

Oracle recommends that you specify `DB_DOMAIN` as a unique string for all databases in a domain.

This parameter allows one department to create a database without worrying that it might have the same name as a database created by another department. If one sales department's `DB_DOMAIN` is `JAPAN.EXAMPLE.COM`, then their `SALES` database (`SALES.JAPAN.EXAMPLE.COM`) is uniquely distinguished from another database with `DB_NAME = SALES` but with `DB_DOMAIN = US.EXAMPLE.COM`.

If you omit the domains from the name of a database link, Oracle expands the name by qualifying the database with the domain of your local database as it currently exists in the data dictionary, and then stores the link name in the data dictionary. `DB_DOMAIN` should start with an alphabetic character and exclude these characters:

```
"!@%^&*()+=\\|`~[{}];:'\",<>/?"
```

**See Also:**

- *Oracle Database Administrator's Guide* for more information on setting this parameter
- The data dictionary view "[GLOBAL_NAME](#)"

2.83 DB_FILE_MULTIBLOCK_READ_COUNT

`DB_FILE_MULTIBLOCK_READ_COUNT` specifies the maximum number of blocks read in one I/O operation during a sequential scan.

Property	Description
Parameter type	Integer
Default value	The default value corresponds to the maximum I/O size that can be efficiently performed and is platform-dependent
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	Operating system-dependent
Basic	No

`DB_FILE_MULTIBLOCK_READ_COUNT` is one of the parameters you can use to minimize I/O during table scans. The total number of I/Os needed to perform a full table scan depends on such factors as the size of the table, the multiblock read count, and whether parallel execution is being utilized for the operation.

The default value of this parameter is a value that corresponds to the maximum I/O size that can be performed efficiently. This value is platform-dependent and is 1MB for most platforms.

Because the parameter is expressed in blocks, it will be set to a value that is equal to the maximum I/O size that can be performed efficiently divided by the standard block size. Note that if the number of sessions is extremely large the multiblock read count value is decreased to avoid the buffer cache getting flooded with too many table scan buffers.

Even though the default value may be a large value, the optimizer will not favor large I/Os if you do not set this parameter. It will favor large I/Os only if you explicitly set this parameter to a large value.

Online transaction processing (OLTP) and batch environments typically have values in the range of 4 to 16 for this parameter. DSS and data warehouse environments tend to benefit most from maximizing the value of this parameter. The optimizer is more likely to choose a full table scan over an index if the value of this parameter is high.

The maximum value is the operating system's maximum I/O size expressed as Oracle blocks $((\text{max I/O size})/\text{DB\_BLOCK\_SIZE})$. If you set this parameter to a value greater than the maximum, then Oracle uses the maximum.

**See Also:**

Oracle Database Performance Tuning Guide for information about how setting this parameter incorrectly can cause excessive I/O waits for some execution plans

2.84 DB_FILE_NAME_CONVERT

DB_FILE_NAME_CONVERT is useful for creating a duplicate database for recovery purposes. It converts the filename of a new datafile on the primary database to a filename on the standby database.

Property	Description
Parameter type	String
Syntax	<pre>DB_FILE_NAME_CONVERT = 'string1' , 'string2' , 'string3' , 'string4' , ...</pre> Where: • <i>string1</i> is the pattern of the primary database filename • <i>string2</i> is the pattern of the standby database filename • <i>string3</i> is the pattern of the primary database filename • <i>string4</i> is the pattern of the standby database filename You can enclose each string in single or double quotation marks. You can specify as many pairs of primary and standby replacement strings as required. However, starting with Oracle Database 12c Release 2 (12.2), Oracle recommends that you limit the number of pairs to 99. Example: <pre>DB_FILE_NAME_CONVERT = '/dbs/t1/', '/dbs/t1/s', 'dbs/t2/', 'dbs/t2/s'</pre>
Default value	There is no default value.
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

If you add a datafile to the primary database, you must add a corresponding file to the standby database. When the standby database is updated, this parameter converts the datafile name on the primary database to the datafile name on the standby database. The file on the standby database must exist and be writable, or the recovery process will halt with an error.

Set the value of this parameter to one or more pairs of strings. The first string in a pair is the pattern found in the datafile names on the primary database. The second string in a pair is the pattern found in the datafile names on the standby database.

If you specify an odd number of strings (the last string has no corresponding replacement string), an error is returned during startup. If the filename being converted matches more than one pattern in the pattern/replace string list, the first matched pattern takes effect. There is no limit on the number of pairs that you can specify in this parameter (other than the hard limit of the maximum length of multivalue parameters). However, starting with Oracle Database 12c Release 2 (12.2), Oracle recommends that you limit the number of pairs to 99.

You can also use DB_FILE_NAME_CONVERT to rename the datafiles in the clone control file when setting up a clone database during tablespace point-in-time recovery.

 See Also:

- *Oracle Database Backup and Recovery User's Guide* for more information about database backup and recovery
- *Oracle Data Guard Concepts and Administration* for more information about Oracle Data Guard

2.85 DB_FILES

`DB_FILES` specifies the maximum number of database files that can be opened for this database.

Property	Description
Parameter type	Integer
Default value	200
Modifiable	No
Modifiable in a PDB	Yes
Range of values	Minimum: the largest among the absolute file numbers of the datafiles in the database Maximum: operating system-dependent
Basic	No
Oracle RAC	Multiple instances must have the same value.

The maximum valid value is the maximum number of files, subject to operating system constraint, that will ever be specified for the database, including files to be added by `ADD DATAFILE` statements.

If you increase the value of `DB_FILES`, then you must shut down and restart all instances accessing the database before the new value can take effect. If you have a primary and standby database, then they should have the same value for this parameter.

 See Also:

- *Oracle Real Application Clusters Administration and Deployment Guide* for information on setting this parameter in an Oracle RAC environment
- Your operating system-specific Oracle documentation for the default value of this parameter

2.86 DB_FLASH_CACHE_FILE

`DB_FLASH_CACHE_FILE` specifies file name(s) for the flash memory or disk group representing a collection of flash memory, for use with Database Smart Flash Cache.

Property	Description
Parameter type	String
Syntax	<code>DB_FLASH_CACHE_FILE = filename [,filename]... disk group</code>
Default value	There is no default value.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

You can specify up to 16 file names for flash memory devices. For example, if there are three flash raw devices:

```
db_flash_cache_file = /dev/raw/sda, /dev/raw/sdb, /dev/raw/sdc
```

Specifying this parameter without also specifying the `DB_FLASH_CACHE_SIZE` initialization parameter is not allowed.

See Also:

["DB_FLASH_CACHE_SIZE"](#)

2.87 DB_FLASH_CACHE_SIZE

`DB_FLASH_CACHE_SIZE` specifies the size of the Database Smart Flash Cache (flash cache). This parameter may only be specified at instance startup.

Property	Description
Parameter type	Big integer
Syntax	<code>DB_FLASH_CACHE_SIZE = integer [K M G T] [, integer [K M G T]]...</code>
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to (DB_BLOCK_SIZE * 256 MB) • If <code>DB_BLOCK_SIZE</code>=2 KB, then 0 - 512 GB • If <code>DB_BLOCK_SIZE</code>=4 KB, then 0 - 1 TB • If <code>DB_BLOCK_SIZE</code>=8 KB, then 0 - 2 TB • If <code>DB_BLOCK_SIZE</code>=16 KB, then 0 - 4 TB • If <code>DB_BLOCK_SIZE</code>=32 KB, then 0 - 8 TB
Basic	No

You can specify up to 16 file sizes, for each of the flash memory devices specified with `DB_FLASH_CACHE_FILE`. For example, if there are three flash raw devices, you can specify the sizes of each device as follows:

```
db_flash_cache_file = /dev/raw/sda, /dev/raw/sdb, /dev/raw/sdc
db_flash_cache_size = 32G, 32G, 64G
```

If your flash cache consists of one flash cache device, you can dynamically change this parameter to 0 for that flash cache device (disabling the flash cache) after the database is started. You can then reenable the flash cache by setting this parameter for the device back to the original value when the database was started. Dynamic resizing of `DB_FLASH_CACHE_SIZE` or reenabling flash cache to a different size is not supported.

If your flash cache includes multiple flash cache devices, you can dynamically change the parameter to 0 for a particular flash cache device (turning it off) after the database is started. You can then reenable that flash cache device by setting this parameter for the device back to the original value it had when the database was started (turning it back on).

For example, to turn off the `/dev/raw/sdb` flash cache device:

```
db_flash_cache_file = /dev/raw/sda, /dev/raw/sdb, /dev/raw/sdc
db_flash_cache_size = 32G, 0, 64G
```

And, to turn the `/dev/raw/sdb` flash cache device back on again:

```
db_flash_cache_file = /dev/raw/sda, /dev/raw/sdb, /dev/raw/sdc
db_flash_cache_size = 32G, 32G, 64G
```

See Also:

["DB_FLASH_CACHE_FILE"](#)

2.88 DB_FLASHBACK_LOG_DEST

`DB_FLASHBACK_LOG_DEST` specifies the location for flashback database log storage.

Property	Description
Parameter type	String
Syntax	<code>DB_FLASHBACK_LOG_DEST = <i>directory</i> <i>disk group</i></code>
Default value	There is no default value.
Modifiable	<code>ALTER SYSTEM ... SID='*'</code> See "Modifying DB_FLASHBACK_LOG_DEST with ALTER SYSTEM"
Modifiable in a PDB	No
Basic	No
Oracle RAC	You must set this parameter for every instance, and multiple instances must have the same value.

This parameter allows you to specify a location for flashback database logs that is separate from the fast recovery area used by backups. For example, you could place flashback database logs in high-performance storage.

Before assigning a value to this parameter, you must set the `DB_FLASHBACK_LOG_DEST_SIZE` parameter to a nonzero value.

Modifying `DB_FLASHBACK_LOG_DEST` with `ALTER SYSTEM`

When modifying the `DB_FLASHBACK_LOG_DEST` parameter with the `ALTER SYSTEM` statement, you must disable and reenable flashback logging. For example:

```
SQL> alter database flashback off;
```

Database altered.

```
SQL> alter system set db_flashback_log_dest='/u01/oracle/dbs/ofba2';
```

System altered.

```
SQL> alter database flashback on;
```

Database altered.

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

- ["DB_FLASHBACK_LOG_DEST_SIZE"](#)
- ["\\$FLASHBACK_LOG_DEST"](#)
- *Oracle Database Backup and Recovery User's Guide* for more information about this parameter

2.89 DB_FLASHBACK_LOG_DEST_SIZE

`DB_FLASHBACK_LOG_DEST_SIZE` specifies the hard limit (in bytes) on the total space to be used by flashback database log files stored in `DB_FLASHBACK_LOG_DEST`.

Property	Description
Parameter type	Big integer
Syntax	<code>DB_FLASHBACK_LOG_DEST_SIZE = integer [K M G]</code>
Default value	0
Modifiable	<code>ALTER SYSTEM ... SID='*'</code>
Modifiable in a PDB	No
Range of values	0 to operating system dependent
Basic	No
Oracle RAC	You must set this parameter for every instance, and multiple instances must have the same value.

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

- "DB_FLASHBACK_LOG_DEST"
- "V\$FLASHBACK_LOG_DEST"
- *Oracle Database Backup and Recovery User's Guide* for more information about this parameter

2.90 DB_FLASHBACK_RETENTION_TARGET

DB_FLASHBACK_RETENTION_TARGET specifies the upper limit (in minutes) on how far back in time the database may be flashed back.

Property	Description
Parameter type	Integer
Default value	1440 (minutes)
Modifiable	ALTER SYSTEM ... SID='*'
Modifiable in a PDB	No
Range of values	0 to $2^{31} - 1$
Basic	No

How far back one can flashback a database depends on how much flashback data Oracle has kept in the fast recovery area.

**See Also:**

Oracle Data Guard Broker for enabling Flashback Database on Oracle Data Guard primary and target standby databases

2.91 DB_INDEX_COMPRESSION_INHERITANCE

DB_INDEX_COMPRESSION_INHERITANCE dictates how index creation inherits compression attributes.

Property	Description
Parameter type	String

Property	Description
Syntax	DB_INDEX_COMPRESSION_INHERITANCE = { TABLESPACE TABLE ALL NONE }
Default value	NONE
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	You must set this parameter for every instance, and multiple instances must have the same value.

Values:

- **TABLESPACE**
Index inheritance is based on tablespace attributes.
- **TABLE**
Index inheritance is based on table attributes.
- **ALL**
Index inheritance is based on table settings. However, if the table does not have default compression attributes, then index inheritance is based on tablespace attributes.
- **NONE**
There is no index inheritance from the table or tablespace.

If the `CREATE INDEX` statement specifies compression attributes, then the value of `DB_INDEX_COMPRESSION_INHERITANCE` is ignored, and there is no inheritance from the table or tablespace. When there is table inheritance or tablespace inheritance (and the tablespace does not have an explicit index compression clause), then the following matrix is used:

Table/Tablespace Level Compression	Inherited Compression for Index
OLTP	ADVANCED LOW
QUERY LOW, QUERY HIGH	ADVANCED HIGH
ARCHIVE LOW, ARCHIVE HIGH	ADVANCED HIGH

**Note:**

The value of `DB_INDEX_COMPRESSION_INHERITANCE` is ignored when creating an index owned by `SYS`. Such indexes do not inherit index compression attributes from tables or tablespaces. If you want to compress an index owned by `SYS`, you must explicitly specify the index compression attributes in the `CREATE INDEX` or `ALTER INDEX` statement.

**See Also:**

Oracle Database Administrator's Guide for more information about index compression

2.92 DB_KEEP_CACHE_SIZE

DB_KEEP_CACHE_SIZE specifies the size of the KEEP buffer pool.

Property	Description
Parameter type	Big integer
Syntax	DB_KEEP_CACHE_SIZE = <i>integer</i> [K M G]
Default value	0 (DB_KEEP_CACHE_SIZE is not configured by default)
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	Minimum: 0 (values greater than zero are automatically modified to be either the granule size * number of processor groups, or 4 MB * number of CPUs, whichever is greater) Maximum: operating system-dependent
Basic	No

The size of the buffers in the KEEP buffer pool is the primary block size (the block size defined by the DB_BLOCK_SIZE initialization parameter).

**See Also:**

- "DB_RECYCLE_CACHE_SIZE"
- *Oracle Database Performance Tuning Guide* for information on setting these parameters and on using multiple buffer pools

2.93 DB_LOST_WRITE_PROTECT

DB_LOST_WRITE_PROTECT enables or disables lost write detection.

Property	Description
Parameter type	String
Syntax	DB_LOST_WRITE_PROTECT = { AUTO TYPICAL FULL NONE }
Default value	AUTO
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

Property	Description
Oracle RAC	In Oracle RAC instances, this parameter value is system-wide.

A data block lost write occurs when an I/O subsystem acknowledges the completion of the block write, while in fact the write did not occur in the persistent storage.

Values:

- `AUTO`

When this parameter is set to `AUTO` on a primary database, the instance automatically decides whether it logs buffer cache reads in the redo log or not, depending on the status of the standby databases. Specifically, the primary database only logs buffer cache reads if physical standby databases with real time redo apply exist.

When this parameter is set to `AUTO` on a standby database, the instance will automatically decide whether it incurs additional performance overhead to perform lost write detection or not, depending on whether apply is keeping up. If apply lag is beyond the reasonable threshold, the standby database will skip lost write protection temporarily until redo apply catches up with primary again, to ensure the lowest Data Guard role transition timings.

The reasonable threshold is determined as follows:

- If Fast Start Failover (FSFO) is configured through Data Guard Broker, based on apply lag threshold, then the threshold is the lesser of 60 seconds and two-thirds of the FSFO apply lag threshold.
- Otherwise, the threshold is 60 seconds.

- `TYPICAL`

When this parameter is set to `TYPICAL` on a primary database, the instance logs buffer cache reads for read/write tablespaces in the redo log, which is necessary for detection of lost writes.

When this parameter is set to `TYPICAL` on a standby database, or on a primary database during media recovery, the instance performs lost write detection, regardless of higher redo apply lags that may impact Data Guard role transition timings.

- `FULL`

When this parameter is set to `FULL` on a primary database, the instance logs reads for read-only tablespaces and read/write tablespaces.

When this parameter is set to `FULL` on a standby database, or on a primary database during media recovery, the instance performs lost write detection.

- `NONE`

When this parameter is set to `NONE` on either a primary database or a standby database, no lost write detection functionality is enabled.

2.94 DB_NAME

`DB_NAME` specifies a database identifier of up to 8 characters.

Property	Description
Parameter type	String

Property	Description
Syntax	<code>DB_NAME = database_name</code>
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	No
Basic	Yes
Oracle RAC	You must set this parameter for every instance. Multiple instances must have the same value.

This parameter must be specified and must correspond to the name specified in the `CREATE DATABASE` statement.

If you have multiple databases, the value of this parameter should match the Oracle instance identifier of each one to avoid confusion with other databases running on the system. The value of `DB_NAME` must be the same in both the standby and production initialization parameter files.

The database name specified in either the `STARTUP` command or the `ALTER DATABASE ... MOUNT` statement for each instance of the cluster database must correspond to the `DB_NAME` initialization parameter setting.

The following characters are valid in a database name: alphanumeric characters, underscore (`_`), number sign (`#`), and dollar sign (`$`). No other characters are valid. The database name must start with an alphabetic character. Oracle removes double quotation marks before processing the database name. Therefore you cannot use double quotation marks to embed other characters in the name. The database name is case insensitive.

See Also:

Oracle Database Administrator's Guide and Oracle Real Application Clusters Administration and Deployment Guide for more information on setting this parameter

2.95 DB_PERFORMANCE_PROFILE

`DB_PERFORMANCE_PROFILE` specifies the performance profile for a database or a pluggable database (PDB).

Property	Description
Parameter type	String
Syntax	<code>DB_PERFORMANCE_PROFILE = string</code>
Default value	There is no default value.
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	The same value should be set on all instances.

A performance profile supports easier management for hundreds of databases or PDBs.

On Oracle Exadata, the performance profile for the regular database or CDB is pushed down to the Exadata storage cells. The performance profile is used for the management of Exadata I/O Resource Manager.

A CDB resource plan can specify different resource controls for a performance profile using the `DBMS_RESOURCE_MANAGER.CREATE_CDB_PROFILE_DIRECTIVE` procedure. A PDB with a matching performance profile will use the specified controls.

The value of `DB_PERFORMANCE_PROFILE` can be up to 30 characters and is not case sensitive.

See Also:

Oracle Database PL/SQL Packages and Types Reference for information about the `DBMS_RESOURCE_MANAGER.CREATE_CDB_PROFILE_DIRECTIVE` procedure.

2.96 DB_RECOVERY_AUTO_REKEY

Use `DB_RECOVERY_AUTO_REKEY` to enable or disable automatic tablespace rekey recovery on Oracle Data Guard standby instances.

Property	Description
Parameter type	String
Syntax	<code>DB_RECOVERY_AUTO_REKEY = { ON OFF }</code>
Default value	ON
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No
Oracle RAC	Multiple instances should use the same value.

This parameter is effective when Oracle Data Guard standby recovery encounters a redo that indicates that the primary database performed a tablespace rekey. If the value of this parameter is `ON`, then standby recovery automatically performs the corresponding tablespace rekey. If the value of this parameter is `OFF`, then standby recovery does not perform a tablespace rekey.

Note:

This parameter is available starting with Oracle Database 23ai.

2.97 DB_RECOVERY_FILE_DEST

`DB_RECOVERY_FILE_DEST` specifies the default location for the fast recovery area.

Property	Description
Parameter type	String
Syntax	<code>DB_RECOVERY_FILE_DEST = directory disk group</code>
Default value	There is no default value.
Modifiable	<code>ALTER SYSTEM ... SID='*'</code>
Modifiable in a PDB	No
Basic	Yes
Oracle RAC	You must set this parameter for every instance, and multiple instances must have the same value.

The fast recovery area contains multiplexed copies of current control files and online redo logs, as well as archived redo logs, flashback logs, and RMAN backups.

Specifying this parameter without also specifying the `DB_RECOVERY_FILE_DEST_SIZE` initialization parameter is not allowed.

See Also:

- *Oracle Database Backup and Recovery User's Guide* for information on setting up and configuring the fast recovery area
- ["DB_RECOVERY_FILE_DEST_SIZE"](#)

2.98 DB_RECOVERY_FILE_DEST_SIZE

`DB_RECOVERY_FILE_DEST_SIZE` specifies (in bytes) the hard limit on the total space to be used by target database recovery files created in the fast recovery area.

Property	Description
Parameter type	Big integer
Syntax	<code>DB_RECOVERY_FILE_DEST_SIZE = integer [K M G]</code>
Default value	0
Modifiable	<code>ALTER SYSTEM ... SID='*'</code>
Modifiable in a PDB	No
Basic	Yes
Oracle RAC	You must set this parameter for every instance, and multiple instances must have the same value.

Note that neither block 0 nor the OS block header of each Oracle file is included in this size. Allow an extra 10% for this data when computing the actual disk usage required for the fast recovery area.

 See Also:

- *Oracle Database Backup and Recovery User's Guide* for information on setting up and configuring the fast recovery area
- ["DB_RECOVERY_FILE_DEST"](#)

2.99 DB_RECYCLE_CACHE_SIZE

DB_RECYCLE_CACHE_SIZE specifies the size of the RECYCLE buffer pool.

Property	Description
Parameter type	Big integer
Syntax	DB_RECYCLE_CACHE_SIZE = <i>integer</i> [K M G]
Default value	0 (DB_RECYCLE_CACHE_SIZE is not configured by default)
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	Minimum: 0 (values greater than zero are automatically modified to be either the granule size * number of processor groups, or 4 MB * number of CPUs, whichever is greater) Maximum: operating system-dependent
Basic	No

The size of the buffers in the RECYCLE pool is the primary block size (the block size defined by the DB_BLOCK_SIZE initialization parameter).

 See Also:

- ["DB_KEEP_CACHE_SIZE"](#)
- *Oracle Database Performance Tuning Guide* for information on setting these parameters and on using multiple buffer pools

2.100 DB_SECUREFILE

DB_SECUREFILE specifies whether to treat LOB files as SecureFiles.

Property	Description
Parameter type	String
Syntax	DB_SECUREFILE = { NEVER PERMITTED PREFERRED ALWAYS IGNORE }

Property	Description
Default value	PERMITTED if the COMPATIBLE initialization parameter is set to 11.2.0.1, 11.2.0.2, or 11.2.0.3, or PREFERRED if the COMPATIBLE initialization parameter is set to 12.0.0.0 or higher
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No

Values

- NEVER

Any LOBs that are specified as SecureFiles are created as BasicFiles LOBs. All SecureFiles-specific storage options and features (for example, compress, encrypt, deduplicate) will cause an exception. The BasicFiles LOB defaults will be used for storage options not specified.

- PERMITTED

LOBs are allowed to be created as SecureFiles.

- PREFERRED

All LOBs are created as SecureFiles unless BASICFILE is explicitly specified in the LOB storage clause or the tablespace is a Manual Segment Space Management tablespace. When PREFERRED is set, cases where BASICFILE would otherwise be inherited from the partition or column level LOB storage are ignored; the LOBs will be created as SecureFiles instead.

- ALWAYS

Attempts to create all LOBs as SecureFiles LOBs but creates any LOBs not in an Automatic Segment Space Managed (ASSM) tablespace as BasicFiles LOBs, unless SECUREFILE is explicitly specified. Any BasicFiles LOB storage options that are specified will be ignored and the SecureFiles LOB defaults will be used for all storage options not specified.

- IGNORE

The SECUREFILE keyword and all SecureFiles options are ignored.

If the COMPATIBLE initialization parameter is not set to 11.1.0 or higher, then LOBs are not treated as SecureFiles.

If there is a LOB column with two partitions (one that has a tablespace for which ASSM is enabled and one that has a tablespace for which ASSM is not enabled), then LOBs in the partition with the ASSM-enabled tablespace will be treated as SecureFiles and LOBs in the other partition will be treated as BasicFiles.

If an application is not certified with SecureFiles, the value of the DB_SECUREFILE initialization parameter can be set to PERMITTED to get the default behavior of Oracle Database 11g.

**See Also:**

Oracle Database SecureFiles and Large Objects Developer's Guide for an example of setting this parameter using the `ALTER SYSTEM` statement

2.101 DB_ULTRA_SAFE

DB_ULTRA_SAFE sets the default values for other parameters that control protection levels.

Property	Description
Parameter type	String
Syntax	DB_ULTRA_SAFE = { OFF DATA_ONLY DATA_AND_INDEX }
Default value	OFF
Modifiable	No
Modifiable in a PDB	No
Basic	No

Values

- OFF

When any of DB_BLOCK_CHECKING, DB_BLOCK_CHECKSUM, or DB_LOST_WRITE_PROTECT are explicitly set, no changes are made.

- DATA_ONLY
 - DB_BLOCK_CHECKING will be set to MEDIUM.
 - DB_LOST_WRITE_PROTECT will be set to TYPICAL.
 - DB_BLOCK_CHECKSUM will be set to FULL.
- DATA_AND_INDEX
 - DB_BLOCK_CHECKING will be set to FULL.
 - DB_LOST_WRITE_PROTECT will be set to TYPICAL.
 - DB_BLOCK_CHECKSUM will be set to FULL.

**See Also:**

- "DB_BLOCK_CHECKING"
- "DB_BLOCK_CHECKSUM"
- "DB_LOST_WRITE_PROTECT"

2.102 DB_UNIQUE_NAME

DB_UNIQUE_NAME specifies a globally unique name for the database.

Property	Description
Parameter type	String
Syntax	DB_UNIQUE_NAME = <i>database_unique_name</i>
Default value	Database instances: the value of DB_NAME Oracle Automatic Storage Management instances: +ASM
Modifiable	No
Modifiable in a PDB	No
Basic	Yes
Oracle RAC	Multiple instances must have the same value.

Databases with the same DB_NAME within the same DB_DOMAIN (for example, copies of a database created for reporting or a physical standby) must have a unique DB_UNIQUE_NAME. Every database's DB_UNIQUE_NAME must be unique within the enterprise.

The value of DB_UNIQUE_NAME can be up to 30 characters and is case insensitive. The following characters are valid in a database name: alphanumeric characters, underscore (_), number sign (#), and dollar sign (\$).

Note:

DB_UNIQUE_NAME is used by several components within an Oracle instance to default file names or file paths, such as the default for the DG_BROKER_CONFIG_FILE*n* initialization parameter. In these cases, on UNIX platforms, the dollar sign (\$) character will be removed from the path or file name, because the character is used by Oracle to define the start of an environment variable substitution within a path or file name.

Note:

As part of their operations, some database tools or utilities create a string that uniquely identifies a database. The string may include the DB_UNIQUE_NAME for a database, and other identifying information for the database, such as the database SID. Oracle Database restricts some identifiers to 30 characters, so using a short DB_UNIQUE_NAME can help prevent ORA-00972 "identifier is too long" messages from database tools and utilities that create a string that includes the DB_UNIQUE_NAME.

**See Also:**

Oracle Data Guard Concepts and Administration and *Oracle Database Administrator's Guide* for more information on setting this parameter

2.103 DB_UNRECOVERABLE_SCN_TRACKING

DB_UNRECOVERABLE_SCN_TRACKING enables or disables the tracking of unrecoverable (NOLOGGING) direct-path INSERT and direct-path load operations.

Property	Description
Parameter type	Boolean
Default value	true
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No
Oracle RAC	Multiple instances must have the same value

When the value is set to `true`, updates are made to the controlfile that maintains the V\$DATAFILE.UNRECOVERABLE_CHANGE# and V\$DATAFILE.UNRECOVERABLE_TIME columns. When the value is set to `false`, updates are not made to the controlfile. Setting this parameter to `false` may improve performance of direct-path NOLOGGING operations.

2.104 DB_WRITER_PROCESSES

DB_WRITER_PROCESSES specifies the initial number of Database Writer Processes for an instance. This parameter is useful for systems that modify data heavily.

Property	Description
Parameter type	Integer
Default value	1 or CPU_COUNT / 8, whichever is greater. If the number of processor groups is less than 100 but greater than the number of Database Writer Processes, then the number of Database Writer Processes is adjusted to be a multiple of the number of processor groups. If the number of Database Writer Processes is greater than or equal to the number of processor groups, then there is no adjustment. For Oracle Solaris on SPARC systems, the default value of this parameter is calculated using an internal algorithm.
Modifiable	No
Modifiable in a PDB	No
Range of values	1 to 100
Basic	No

There can be 1 to 100 Database Writer Processes. The names of the first 36 Database Writer Processes are DBW0-DBW9 and DBWa-DBWz. The names of the 37th through 100th Database Writer Processes are BW36-BW99.

 See Also:

- [Background Processes](#) for additional information about the Database Writer Process
- *Oracle Database Concepts* for information on when the Database Writer Process writes dirty buffers to disk

2.105 DBFIPS_140

DBFIPS_140 enables Transparent Data Encryption (TDE) and DBMS_CRYPTO PL/SQL package program units to run in a mode compliant to the Federal Information Processing Standard (subsequently known as "FIPS mode").

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	No
Modifiable in a PDB	No
Range of values	true false
Basic	No
Oracle RAC	All instances must use the same value.

Set this parameter to `true` to use TDE and DBMS_CRYPTO in FIPS mode. This means that only FIPS-compliant algorithms may be used. By default, this parameter is set to `false`. When this parameter is set to `false`, all algorithms (FIPS-compliant or not) may be used.

 See Also:

- *Oracle Database Security Guide* for information about configuring Oracle Database FIPS 140 settings
- *Oracle Database Security Guide* for a table that describes the effect of setting the value of DBFIPS_140 to `true` or `false` on different platforms

2.106 DBNEST_ENABLE

DBNEST_ENABLE allows you to enable or disable dbNest.

Note:

This parameter is applicable only on Linux systems.

Property	Description
Parameter type	String
Syntax	DBNEST_ENABLE = { NONE CDB_RESOURCE_PDB_ALL }
Default value	NONE
Modifiable	No
Modifiable in a PDB	No
Basic	No
Oracle RAC	All instances should use the same value.

DbNest provides operating system resource isolation and management, file system isolation, and secure computing for PDBs. The infrastructure is implemented as a Linux-specific package that provides hierarchical containers, called nests. A CDB resides within a single parent nest, while PDBs reside within the individual child nests created within the parent. The isolation and resource management properties of a nest are separate. A full nest includes both isolation and resource management. Alternatively, you can configure a partial nest that includes only resource management.

You can set the following values for this parameter:

- **NONE:** Disables dbNest. This is the default value.
- **CDB_RESOURCE_PDB_ALL:** Enables a resource management-only nest for the CDB and a full nest for each PDB.

See Also:

Oracle Multitenant Administrator's Guide for information on securing and isolating resources using dbNest

2.107 DBNEST_PDB_FS_CONF

DBNEST_PDB_FS_CONF specifies the dbNest file system configuration file for a PDB.

Note:

This parameter is applicable only on Linux systems.

Property	Description
Parameter type	String
Syntax	<code>DBNEST_PDB_FS_CONF = 'pathname'</code>
Default value	None
Modifiable	No
Modifiable in a PDB	No
Basic	No
Oracle RAC	Multiple instances can have different values.

A dbNest file system configuration file specifies directories to be mounted inside the nest for a PDB. These directories are mounted in addition to the default directories.

For *pathname*, specify the full operating system path for the file.

If you do not set this parameter, then only the default directories are mounted.

See Also:

Oracle Multitenant Administrator's Guide for information on dbNest file system configuration files

2.108 DBWR_IO_SLAVES

`DBWR_IO_SLAVES` specifies the number of I/O server processes used by the `DBW0` process.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	No
Modifiable in a PDB	No
Range of values	0 to operating system-dependent
Basic	No

`DBWR_IO_SLAVES` is relevant only on systems with only one database writer process (`DBW0`). The `DBW0` process and its server processes always write to disk. By default, the value is 0 and I/O server processes are not used.

If you set `DBWR_IO_SLAVES` to a nonzero value, the number of I/O server processes used by the `ARCH` and `LGWR` processes is set to 4. However, the number of I/O server processes used by Recovery Manager is set to 4 only if asynchronous I/O is disabled (either your platform does not support asynchronous I/O or `disk_asynch_io` is set to `false`).

Typically, I/O server processes are used to simulate asynchronous I/O on platforms that do not support asynchronous I/O or that implement it inefficiently. However, you can use I/O server processes even when asynchronous I/O is being used. In that case the I/O server processes will use asynchronous I/O.

I/O server processes are also useful in database environments with very large I/O throughput, even if asynchronous I/O is enabled.

 See Also:

- ["BACKUP_TAPE_IO_SLAVES"](#)
- *Oracle Database Performance Tuning Guide* for more information about this parameter

2.109 DDL_LOCK_TIMEOUT

DDL_LOCK_TIMEOUT specifies a time limit for how long DDL statements will wait in a DML lock queue.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to 1,000,000 (in seconds)
Basic	No

A value of zero indicates a status of `NOWAIT`. The maximum value of 1,000,000 seconds will result in the DDL statement waiting forever to acquire a DML lock.

If a lock is not acquired before the timeout period expires, then an error is returned.

 See Also:

- *Oracle Database Administrator's Guide* for more information about the DDL_LOCK_TIMEOUT parameter
- *Oracle Database Development Guide* for information about nonblocking and blocking DDL

2.110 DEFAULT_SHARING

DEFAULT_SHARING sets the value of the sharing clause in statements creating objects in an application root.

Property	Description
Parameter type	String
Syntax	DEFAULT_SHARING = { NONE METADATA DATA EXTENDED DATA }

Property	Description
Default value	For types of objects that support sharing, <code>METADATA</code> is the default. For types of objects that do not support sharing, <code>NONE</code> is the default.
Modifiable	<code>ALTER SESSION</code> , <code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	All instances must have the same value

Specifying `SHARING=` in the create DDL overrides the value of the `DEFAULT_SHARING` parameter.

Example

Issuing the following `ALTER SYSTEM` statement in an application root sets the default value of the sharing clause to `NONE` in the server parameter file for the application root:

```
ALTER SYSTEM SET DEFAULT_SHARING = NONE SCOPE = SPFILE;
```

2.111 DEFERRED_SEGMENT_CREATION

`DEFERRED_SEGMENT_CREATION` specifies the semantics of deferred segment creation.

Property	Description
Parameter type	Boolean
Default value	<code>true</code>
Modifiable	<code>ALTER SESSION</code> , <code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Range of values	<code>true</code> <code>false</code>
Basic	No

If set to `true`, then segments for tables and their dependent objects (LOBs, indexes) will not be created until the first row is inserted into the table.

Before creating a set of tables, if it is known that a significant number of them will not be populated, then consider setting this parameter to `true`. This saves disk space and minimizes install time.

2.112 DG_BROKER_CONFIG_FILEn

`DG_BROKER_CONFIG_FILEn` (where $n = 1, 2$) specifies the names for the Data Guard broker configuration files.

Property	Description
Parameter type	String
Syntax	<code>DG_BROKER_CONFIG_FILE[1 2] = filename</code>
Default value	Operating system-dependent
Modifiable	<code>ALTER SYSTEM</code>

Property	Description
Modifiable in a PDB	No
Range of values	One filename
Basic	No

Every database that is part of a Data Guard broker configuration has two broker configuration files, which contain entries that describe the state and properties of the configuration (such as the sites and databases that are part of the configuration, the roles and properties of each of the databases, and the state of each of the elements of the configuration). Two files are provided to always maintain the last known good state of the configuration.

If `DG_BROKER_CONFIG_FILEn` is not explicitly defined, then it is set to an operating system-specific default value at instance startup. This parameter can be altered only when the Data Guard broker is not running. See ["DG_BROKER_START"](#) for information on how to stop and start the broker.

See Also:

Oracle Data Guard Broker for more information about setting this parameter

2.113 DG_BROKER_START

`DG_BROKER_START` enables Oracle to determine whether the Oracle Data Guard broker should be started.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SYSTEM...SID='*'
Modifiable in a PDB	No
Range of values	true false
Basic	No

The Oracle Data Guard broker consists of background processes, foreground processes, and the system global area (SGA). The background and foreground processes exist as long as the instance exists, whenever this parameter is set to `true`.

If the database is never going to be configured in an Oracle Data Guard broker configuration, then you can leave this parameter unspecified and accept the default value of `false`. If the database is part of an Oracle Data Guard broker configuration, then you can simplify automatic startup of the broker by setting this parameter to `true` in the initialization parameter file.

**See Also:**

Oracle Data Guard Broker for examples of using this parameter to start the Oracle Data Guard broker

2.114 DIAGNOSTIC_DEST

As of Oracle Database 11g Release 1 (11.1), the diagnostics for each database instance are located in a dedicated directory that is specified by the `DIAGNOSTIC_DEST` initialization parameter.

Property	Description
Parameter type	String
Syntax	<code>DIAGNOSTIC_DEST = { pathname directory }</code>
Default value	Derived from the value of the <code>\$ORACLE_BASE</code> environment variable. If <code>\$ORACLE_BASE</code> is not set, then derived from <code>ORACLE_BASE</code> as set by the Oracle Universal Installer. If <code>ORACLE_BASE</code> is not set, then <code>\$ORACLE_HOME/rdbms/log</code> is used.
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	No
Basic	No
Oracle RAC	This parameter can be set on each instance. Oracle recommends that each instance in a cluster specify a <code>DIAGNOSTIC_DEST</code> directory location that is located on shared disk and that the same value for <code>DIAGNOSTIC_DEST</code> be specified for each instance.

The structure of the directory specified by `DIAGNOSTIC_DEST` is as follows:

```
<diagnostic_dest>/diag/rdbms/<dbname>/<instname>
```

This location is known as the Automatic Diagnostic Repository (ADR) Home. For example, if the database name is `proddb` and the instance name is `proddb1`, the ADR home directory would be `<diagnostic_dest>/diag/rdbms/proddb/proddb1`.

The following files are located under the ADR home directory:

- Trace files - located in subdirectory `<adr-home>/trace`
- Alert logs - located in subdirectory `<adr-home>/alert`. In addition, the `alert.log` file is now in XML format, which conforms to the Oracle ARB logging standard.
- Core files - located in the subdirectory `<adr-home>/cdump`
- Incident files - the occurrence of each serious error (for example, ORA-600, ORA-1578, ORA-7445) causes an incident to be created. Each incident is assigned an ID and dumping for each incident (error stack, call stack, block dumps, and so on) is stored in its own file, separated from process trace files. Incident dump files are located in `<adr-home>/incident/<incdir#>`. You can find the incident dump file location inside the process trace file.

**See Also:**

Oracle Automatic Storage Management Administrator's Guide for an example of the diagnostic directory for an Oracle ASM instance

2.115 DIAGNOSTICS_CONTROL

`DIAGNOSTICS_CONTROL` enables you to control and monitor the users who perform potentially unsafe database diagnostic operations.

Property	Description
Parameter type	String
Syntax	<code>DIAGNOSTICS_CONTROL = { ERROR WARNING IGNORE }</code>
Default value	IGNORE
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No
Oracle RAC	The same value must be used on all instances.

When diagnosing Oracle database issues, an Oracle Support Service staff member might instruct you to perform diagnostic operations. Some diagnostic operations are harmless. However, others could have adverse effects if not performed properly with the guidance of an Oracle Support Service staff member. In order to control and monitor who performs such diagnostic operations, Oracle Database 20 introduces the following security controls:

- Potentially unsafe diagnostic operations are internally identified in the database. These operations include setting certain debug events and debug actions with the `ALTER SESSION` or `ALTER SYSTEM` statement. For example:

```
ALTER SESSION SET EVENTS '1357 trace name context forever, level 2';
ALTER SYSTEM SET EVENTS 'trace[vos]';
```

- A user can be authorized to perform potentially unsafe diagnostic operations, either by being granted the `ENABLE DIAGNOSTICS` system privilege, or by being granted the `DBA` role, or by authenticating as `SYSDBA`.
- The `DIAGNOSTICS_CONTROL` initialization parameter enables you to specify how the database responds when an *unauthorized* user attempts to perform these diagnostic operations. The possible values are:
 - **ERROR:** When an unauthorized user attempts to perform a potentially unsafe diagnostic operation, the attempt fails with error `ORA-01031: insufficient privileges`.
 - **WARNING:** When an unauthorized user attempts to perform a potentially unsafe diagnostic operation, the attempt succeeds, but a warning is written to the alert log.
 - **IGNORE:** When an unauthorized user attempts to perform a potentially unsafe diagnostic operation, the attempt succeeds and no error messages or warnings occur. This is the default.

**Note:**

When altering the `DIAGNOSTICS_CONTROL` initialization parameter, be aware of the following guidelines:

- To modify this parameter with the `ALTER SYSTEM` command, you must be authenticated `AS SYSDBA`.
- In Oracle RAC environments, it is currently not possible to modify this parameter on remote instances by specifying the `SID` clause in the `ALTER SYSTEM SET` statement.

2.116 DISK_ASYNC_IO

`DISK_ASYNC_IO` controls whether I/O to datafiles, control files, and logfiles is asynchronous (that is, whether parallel server processes can overlap I/O requests with CPU processing during table scans).

Property	Description
Parameter type	Boolean
Default value	<code>true</code>
Modifiable	No
Modifiable in a PDB	No
Range of values	<code>true</code> <code>false</code>
Basic	No

If your platform supports asynchronous I/O to disk, Oracle recommends that you leave this parameter set to its default value. However, if the asynchronous I/O implementation is not stable, you can set this parameter to `false` to disable asynchronous I/O. If your platform does not support asynchronous I/O to disk, this parameter has no effect.

If you set `DISK_ASYNC_IO` to `false`, then you can increase `DB_WRITER_PROCESSES` or use `DBWR_IO_SLAVES` to simulate asynchronous I/O.

**See Also:**

- ["DB_WRITER_PROCESSES"](#)
- ["DBWR_IO_SLAVES"](#)
- *Oracle Database Performance Tuning Guide* for more information

2.117 DISPATCHERS

`DISPATCHERS` configures dispatcher processes in the shared server architecture.

Property	Description
Parameter type	String
Syntax	DISPATCHERS = 'dispatch_clause'
Syntax	dispatch_clause::= (PROTOCOL = protocol) (ADDRESS = address) (DESCRIPTION = description) [options_clause]
Syntax	options_clause::= (DISPATCHERS = integer SESSIONS = integer CONNECTIONS = integer MULTIPLEX = {1 ON YES TRUE 0 OFF NO FALSE BOTH IN OUT} LISTENER = tnsname SERVICE = service INDEX = integer)
Default value	If SHARED_SERVERS is greater than 0, then DISPATCHERS defaults to ' (PROTOCOL=tcp) ', causing 1 TCP/IP dispatcher to be created.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

The parsing software supports a name-value syntax to enable the specification of attributes in a position-independent, case-insensitive manner. For example:

```
DISPATCHERS = ' (PROTOCOL=TCP) (DISPATCHERS=3) '
```

Attributes may be specified using the full attribute name or any substring beginning with the first 3 characters. For example, SESSIONS can be specified as SES, SESS, SESSI, and so on.

Specify only one of the following attributes: PROTOCOL, ADDRESS, or DESCRIPTION. If you specify either ADDRESS or DESCRIPTION, then you can specify additional network attributes. Doing so supports multi-homed hosts.

dispatch_clause

- PROTOCOL
The network protocol for which the dispatcher generates a listening endpoint.
- ADDRESS
The network protocol address of the endpoint on which the dispatchers listen.
- DESCRIPTION
The network description of the endpoint on which the dispatchers listen, including the protocol address.

options_clause

- DISPATCHERS

The initial number of dispatchers to start. The default is 1.

- SESSIONS

The maximum number of network sessions to allow for each dispatcher. The default is operating system-specific. Most operating systems have a default of 16 KB.

- CONNECTIONS

The maximum number of network connections to allow for each dispatcher. The default is operating system-specific.

- MULTIPLY

Enables the Oracle Connection Manager session multiplexing feature.

- The values 1, ON, YES, TRUE, and BOTH indicate that Network Session Multiplex is enabled for both incoming and outgoing network connections.
- The value IN indicates that Network Session Multiplex is enabled for incoming network connections.
- The value OUT indicates that Network Session Multiplexing is enabled for outgoing network connections.
- The values 0, NO, OFF, and FALSE indicate that Network Session Multiplexing is disabled for both incoming and outgoing network connections. This is the default.

- LISTENER

Specifies the network name of an address or address list of the Oracle Net listeners with which the dispatchers will register.

The LISTENER attribute facilitates administration of multi-homed hosts. This attribute specifies the appropriate listeners with which the dispatchers will register. The LISTENER attribute takes precedence over the LOCAL_LISTENER and REMOTE_LISTENER parameters. See "LOCAL_LISTENER" and "REMOTE_LISTENER".

- SERVICE

Specifies one or more names by which clients can connect to the dispatchers. The SERVICE attribute takes precedence over any settings configured by using the SRVCTL command-line utility, the GDSCTL command-line utility, or the DBMS_SERVICE PL/SQL package.

- INDEX

Use this attribute in an ALTER SYSTEM SET DISPATCHERS statement to indicate which dispatcher configuration you want to modify. (If you specify INDEX in the initialization parameter file, the Oracle Database ignores it.) In an ALTER SYSTEM statement, INDEX specifies the order in which the parameter's values were initialized. The value ranges from 0 (for the first dispatcher configuration) to one less than the total number of dispatcher configurations you define.

For example, if you specify 3 dispatcher configurations in the initialization parameter file, you would modify the third dispatcher configuration by specifying INDEX=2 in the ALTER SYSTEM statement. You could also add another dispatcher configuration in the ALTER SYSTEM statement by specifying INDEX=3.

If `INDEX` is not specified in the `ALTER SYSTEM` statement, then the `PROTOCOL`, `ADDRESS`, or `DESCRIPTION` attributes must be specified, and if a dispatcher configuration matching this `PROTOCOL`, `ADDRESS`, or `DESCRIPTION` exists, then that configuration will be modified. Otherwise, a new configuration will be added.

 See Also:

- ["SHARED_SERVERS"](#)
- *Oracle Database Net Services Administrator's Guide* and *Oracle Database Administrator's Guide* for more information on setting this parameter

2.118 DISTRIBUTED_LOCK_TIMEOUT

`DISTRIBUTED_LOCK_TIMEOUT` specifies the amount of time (in seconds) for distributed transactions to wait for locked resources.

Property	Description
Parameter type	Integer
Default value	60
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Range of values	1 to $2^{31} - 1$
Basic	No

 See Also:

Oracle Database Concepts for more information on data concurrency

2.119 DML_LOCKS

`DML_LOCKS` specifies the maximum number of DML locks—one for each table modified in a transaction.

Property	Description
Parameter type	Integer
Default value	Derived: $4 * \text{TRANSACTIONS}$
Modifiable	No
Modifiable in a PDB	No
Range of values	20 to unlimited; a setting of 0 disables enqueues
Basic	No

Property	Description
Oracle RAC	You must set this parameter for every instance, and all instances must have positive values or all must be 0.

A **DML lock** is a lock obtained on a table that is undergoing a DML operation (insert, update, delete). The `DML_LOCKS` value should equal the grand total of locks on tables currently referenced by all users. For example, if three users are modifying data in one table, then three entries would be required. If three users are modifying data in two tables, then six entries would be required.

The default value assumes an average of four tables referenced for each transaction. For some systems, this value may not be enough.

Enqueues are shared memory structures that serialize access to database resources. If you set the value of `DML_LOCKS` to 0, enqueues are disabled and performance is slightly increased. However, you should be aware of the following restrictions when you set `DML_LOCKS` to 0:

- You cannot use `DROP TABLE`, `CREATE INDEX` statements
- You cannot use explicit lock statements such as `LOCK TABLE IN EXCLUSIVE MODE`
- Enterprise Manager cannot run on any instances for which `DML_LOCKS` is set to 0

Oracle holds more locks during parallel DML than during serial execution. Therefore, if your database supports a lot of parallel DML, you may need to increase the value of this parameter.

See Also:

- *Oracle Database Concepts* for a discussion of lock and enqueue resources needed for parallel DML
- *Oracle Database Concepts* for more information on data concurrency

2.120 DNFS_BATCH_SIZE

`DNFS_BATCH_SIZE` controls the number of asynchronous I/O's that can be queued by an Oracle process when Direct NFS Client is enabled.

Property	Description
Parameter type	Integer
Default value	4096
Modifiable	No
Modifiable in a PDB	No
Range of values	0 - 4096
Basic	No

In environments where the NFS server cannot handle a large number of outstanding asynchronous I/O requests, use this parameter to limit the number of I/O's issued by an Oracle foreground process. The recommended setting for this parameter is to start at 128 and increase or decrease it based on NFS server performance.

**See Also:**

Oracle Database Performance Tuning Guide for additional information about the DNFS_BATCH_SIZE initialization parameter

2.121 DRCP_CONNECTION_LIMIT

DRCP_CONNECTION_LIMIT specifies the maximum number of Database Resident Connection Pooling (DRCP) connections for a PDB.

Property	Description
Parameter type	Integer
Default value	In CDB\$ROOT: 0 (unlimited) In a PDB: - If a persistent value for SESSIONS was explicitly set for the PDB (ALTER SYSTEM SET SESSIONS = <i>n</i> SCOPE={ SPFILE BOTH}), and the PDB was subsequently restarted, then the default value is (10 * SESSIONS). - Otherwise, the PDB inherits the value for this parameter from CDB\$ROOT.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to operating system-dependent A value of 0 specifies that there is no limit on the number of DRCP connections.
Basic	No
Oracle RAC	Different instances can use different values.

DRCP_CONNECTION_LIMIT is a PDB-inherited parameter. The value of this parameter in CDB\$ROOT is not a CDB-wide limit. It is the default value for each PDB.

2.122 DRCP_DEDICATED_OPT

Use DRCP_DEDICATED_OPT to enable or disable the use of dedicated optimization with Database Resident Connection Pooling (DRCP).

Dedicated optimization causes DRCP to behave like a dedicated server when the number of connections to the DRCP broker is less than the DRCP maximum size.

Property	Description
Parameter type	String
Syntax	DRCP_DEDICATED_OPT = { YES NO }
Default value	NO
Modifiable	ALTER SYSTEM

Property	Description
Modifiable in a PDB	Yes, according to the following guidelines: • When the <code>ENABLE_PER_PDB_DRCP</code> initialization parameter is set to <code>true</code>, <code>DRCP_DEDICATED_OPT</code> can be modified only at the PDB level; it cannot be modified for the CDB root. • When the <code>ENABLE_PER_PDB_DRCP</code> initialization parameter is set to <code>false</code>, <code>DRCP_DEDICATED_OPT</code> can be modified only for the CDB root; it cannot be modified at the PDB level.
Basic	No
Oracle RAC	Different instances can use different values.

When the value of this parameter is set to `YES`, the use of dedicated optimization with DRCP is enabled. When it is set to `NO`, the use of dedicated optimization with DRCP is disabled.

See Also:

- *Oracle Database Administrator's Guide* for more information about setting this parameter
- ["ENABLE_PER_PDB_DRCP"](#)

2.123 DST_UPGRADE_INSERT_CONV

`DST_UPGRADE_INSERT_CONV` specifies whether internal operators will be allocated on top of `TIMESTAMP WITH TIME ZONE (TSTZ)` columns of tables which have not been upgraded during the upgrade window of daylight saving time patching for `TIMESTAMP WITH TIME ZONE` data.

Property	Description
Parameter type	Boolean
Default value	<code>true</code>
Modifiable	<code>ALTER SESSION</code> , <code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Range of values	<code>true</code> <code>false</code>
Basic	No

Values

- `true`
Internal operators will be allocated on top of TSTZ columns of tables which have not been upgraded. This is the default.
- `false`
Internal operators will not be allocated on top of TSTZ columns of tables which have not been upgraded.

When `DST_UPGRADE_INSERT_CONV` is set to `true` during the upgrade window of the daylight saving time patching process:

- `SELECT` queries on tables with TSTZ data which have not been upgraded will use internal operators on top of TSTZ columns to present TSTZ data as if they were recorded using the new time zone translation rules.
- DML on tables with TSTZ data which have not been upgraded will use internal operators on top of TSTZ columns to ensure that the TSTZ data is recorded using the old time zone translation rules in order to be consistent with the existing TSTZ data in the same tables.

 Note:

Oracle strongly recommends that this parameter is set to `true` throughout the upgrade window of the daylight saving time patching process. This parameter reduces the performance impact since indexes on TSTZ columns will be disabled whenever internal operators are allocated. If the parameter is set to `false`, then indexes will be used and this may affect performance of queries against TSTZ data during the DST upgrade window. Turning off this parameter during the upgrade window may corrupt data on disk when DMLs occur for tables with TSTZ data which have not yet been upgraded.

 See Also:

Oracle Database Globalization Support Guide for more information about this parameter

2.124 ENABLE_AUTOMATIC_MAINTENANCE_PDB

ENABLE_AUTOMATIC_MAINTENANCE_PDB can be used to enable or disable the running of automated maintenance tasks for all the PDBs in a CDB or for individual PDBs in a CDB.

Property	Description
Parameter type	Boolean
Default value	<code>true</code>
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Range of values	<code>true</code> <code>false</code>
Basic	No
Oracle RAC	The same value should be used for all instances.

 Note:

The value of this parameter in CDB\$ROOT (the root of a CDB) has no effect in the root. Automated maintenance tasks are always run in the root, regardless of the setting of this parameter.

By default, the value of `ENABLE_AUTOMATIC_MAINTENANCE_PDB` is `true` in `CDB$ROOT` (the root container in the CDB) and in the individual PDBs in a CDB. This means that by default, automated maintenance tasks are run for the CDB root and all the PDBs in the CDB.

When you change the value of `ENABLE_AUTOMATIC_MAINTENANCE_PDB` in the CDB root, the new value takes effect in the root and in all the PDBs in the CDB.

Therefore, if you change the value of `ENABLE_AUTOMATIC_MAINTENANCE_PDB` in the CDB root to `false`, the value of `ENABLE_AUTOMATIC_MAINTENANCE_PDB` is also changed to `false` in all of the PDBs in the CDB.

You can also change the value of `ENABLE_AUTOMATIC_MAINTENANCE_PDB` in any of the individual PDBs in a CDB, and the value that is set for each individual PDB will be honored. This enables you to enable or disable automated maintenance tasks for individual PDBs.

See Also:

- "[AUTOTASK_MAX_ACTIVE_PDBS](#)" for information about specifying the maximum number of PDBs that can schedule automated maintenance tasks at the same time
- *Oracle Database Administrator's Guide* for more information about managing automated database maintenance tasks

2.125 ENABLE_DDL_LOGGING

`ENABLE_DDL_LOGGING` enables or disables the writing of a subset of data definition language (DDL) statements to a DDL log.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No

The DDL log is a file that has the same format and basic behavior as the alert log, but it only contains the DDL statements issued by the database. The DDL log is created only for the RDBMS component and only if the `ENABLE_DDL_LOGGING` initialization parameter is set to `true`. When this parameter is set to `false`, DDL statements are not included in the DDL log, but they are included in the alert log.

The DDL log contains one log record for each DDL statement issued by the database. The DDL log is included in IPS incident packages.

There are two DDL logs that contain the same information. One is an XML file, and the other is a text file. The DDL log is stored in the `log/ddl` subdirectory of the ADR home.

When `ENABLE_DDL_LOGGING` is set to `true`, the following DDL statements are written to the log:

- ALTER/CREATE/DROP/TRUNCATE CLUSTER
- ALTER/CREATE/DROP FUNCTION
- GRANT
- ALTER/CREATE/DROP INDEX
- ALTER/CREATE/DROP OUTLINE
- ALTER/CREATE/DROP PACKAGE
- ALTER/CREATE/DROP PACKAGE BODY
- ALTER/CREATE/DROP PROCEDURE
- ALTER/CREATE/DROP PROFILE
- REVOKE
- ALTER/CREATE/DROP SEQUENCE
- CREATE/DROP SYNONYM
- ALTER/CREATE/DROP/RENAME/TRUNCATE TABLE
- ALTER/CREATE/DROP TRIGGER
- ALTER/CREATE/DROP TYPE
- ALTER/CREATE/DROP TYPE BODY
- DROP USER
- ALTER/CREATE/DROP VIEW

**Note:**

The DDL statement written to the log may be truncated. You can use DDL triggers to view the entire DDL statement. See *Oracle Database PL/SQL Language Reference* for more information about DDL triggers.

**See Also:**

Oracle Database Licensing Information User Manual for licensing information for the `ENABLE_DDL_LOGGING` initialization parameter.

2.126 ENABLE_DNFS_DISPATCHER

`ENABLE_DNFS_DISPATCHER` enables dispatcher support for the Oracle Direct NFS client.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	No

Property	Description
Modifiable in a PDB	No
Range of values	true false
Basic	No
Oracle RAC	All instances should use the same value.

When this parameter is set to `true` in the initialization parameter file, dispatcher processes will be spawned for the Oracle Direct NFS client.

The number of dispatcher processes spawned is calculated as one-eighth of the value of the `CPU_COUNT` parameter.

See Also:

"CPU_COUNT"

2.127 ENABLE_GOLDENGATE_REPLICATION

`ENABLE_GOLDENGATE_REPLICATION` controls services provided by the RDBMS for Oracle GoldenGate (both capture and apply services).

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	true false
Basic	No
Oracle RAC	All instances must have the same setting

Set this parameter to `true` to enable RDBMS services used by Oracle GoldenGate.

This parameter primarily controls supplemental logging required to support logical replication of new data types and operations. The redo log file is designed to be applied physically to a database, therefore the default contents of the redo log file often do not contain sufficient information to allow logged changes to be converted into SQL statements. Supplemental logging adds extra information into the redo log files so that replication can convert logged changes into SQL statements without having to access the database for each change. Previously these extra changes were controlled by the supplemental logging DDL. Now the `ENABLE_GOLDENGATE_REPLICATION` parameter must also be set to enable the required supplemental logging for any new data types or operations.

All enhancements to supplemental logging required to support logical replication are also controlled by this parameter.

The RDBMS services controlled by this parameter also include (but are not limited to):

- Transparent Data Encryption (including Tablespace Encryption) utilities used by GoldenGate Extract
- Service to read redo logs used by GoldenGate Extract
- Service to suppress triggers used by GoldenGate Replicat
- Service to handle transient duplicate handling used by GoldenGate Replicat
- Service to bypass referential integrity checking used by GoldenGate Replicat
- Services required to run Oracle GoldenGate in Integrated Extract and Integrated Replicat

**Note:**

You must purchase a license in order to use Oracle GoldenGate. Refer to *Oracle GoldenGate Licensing Information* and ensure that you have obtained the appropriate licensing before setting this parameter to `true`.

2.128 ENABLE_IMC_WITH_MIRA

ENABLE_IMC_WITH_MIRA enables or disables the In-Memory Column Store and Oracle Data Guard Multi-Instance Redo Apply, at the same time, on an Active Data Guard standby database.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	true false
Basic	No
Oracle RAC	Different instances can use different values.

The value of this parameter is relevant only on the instance where MRP0 is spawned at the start of Redo Apply on a standby database.

2.129 ENABLE_PER_PDB_DRCP

ENABLE_PER_PDB_DRCP controls whether Database Resident Connection Pooling (DRCP) configures one connection pool for the entire CDB or one isolated connection pool for each PDB.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	No
Modifiable in a PDB	No

Property	Description
Range of values	true false
Basic	No
Oracle RAC	Multiple instances must have the same value.

Possible values:

- true

DRCP creates one isolated connection pool for each PDB. You can connect to a particular PDB and configure, manage, and monitor its connection pool according to the specific requirements for that PDB. For example, you can set values for the `MIN_AUTH_SERVERS`, `MAX_AUTH_SERVERS`, and `DRCP_DEDICATED_OPT` initialization parameters for a PDB, and you can use the `DBMS_CONNECTION_POOL` package to manage the connection pool for a PDB.

When `ENABLE_PER_PDB_DRCP` is set to `true`, there is no connection pool for the entire CDB. The values of the `MIN_AUTH_SERVERS`, `MAX_AUTH_SERVERS`, and `DRCP_DEDICATED_OPT` initialization parameters have no meaning in the CDB root and you cannot alter them, nor can you use the `DBMS_CONNECTION_POOL` package while connected to the CDB root.

- false

DRCP creates one connection pool for the entire CDB. This connection pool is shared by all PDBs. You can set the `MIN_AUTH_SERVERS`, `MAX_AUTH_SERVERS`, and `DRCP_DEDICATED_OPT` initialization parameters only in the CDB root, and you can use the `DBMS_CONNECTION_POOL` only while connected to the CDB root.

 See Also:

- "MIN_AUTH_SERVERS"
- "MAX_AUTH_SERVERS"
- "DRCP_DEDICATED_OPT"
- *Oracle Database PL/SQL Packages and Types Reference* for more information on the `DBMS_CONNECTION_POOL` package

2.130 ENABLE_PLUGGABLE_DATABASE

`ENABLE_PLUGGABLE_DATABASE` is a bootstrap initialization parameter to create a CDB.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	No
Modifiable in a PDB	No
Range of values	true false
Basic	No

This parameter enables a database in `NOMOUNT` startup mode to know that it is a CDB.

**Note:**

See *Oracle Multitenant Administrator's Guide* for more information about CDBs and PDBs.

2.131 ENABLED_PDBS_ON_STANDBY

`ENABLED_PDBS_ON_STANDBY` specifies which pluggable databases (PDBs) to replicate on an Oracle Data Guard standby database.

Property	Description
Parameter type	String
Syntax	<code>ENABLED_PDBS_ON_STANDBY = PDB-list</code>
Default value	* if no value is specified for this parameter in the <code>init.ora</code> file
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	No
Basic	No
Oracle RAC	All instances should use the same value.

**Note:**

This parameter is meaningful only on standby databases. Its settings are ignored on a primary database.

`PDB-list` accepts a list of PDB names represented by glob patterns such as “PDB?” or “PDB*a”, “PDB2”. The glob pattern rules are like those of UNIX shells. The asterisk (*) and question mark (?) wildcard characters are supported. The ? wildcard character matches exactly one unknown character, and the * wildcard character matches any number of unknown characters. Also, the minus sign (-) character can be used as the first character in a PDB name to indicate that the PDB should be excluded on the standby database.

The following characters are valid in a PDB name: alphanumeric characters, underscore (_), number sign (#), and dollar sign (\$). No other characters are valid. Oracle removes double quotation before processing the PDB name. Therefore you cannot use double quotation marks to embed other characters in the name. The PDB name is case insensitive. These are the same naming conventions as for a database name (as described in the `DB_NAME` initialization parameter description).

These rules apply for the `ENABLED_PDBS_ON_STANDBY` parameter:

- Any PDB names that match glob patterns starting with minus sign (-) will not be part of the standby database.
- If a PDB name matches several patterns in the `PDB-list` at the same time, the rightmost matched pattern has the highest precedence.

- If this parameter is not specified in the `init.ora` file, it is assumed that `"*"` is specified by default.
- If one or more patterns are specified in this parameter, it is assumed that `"_*"` is implicitly specified in the leftmost position. For example, `ENABLED_PDBS_ON_STANDBY="PDB1"`, `"PDB2"` is equivalent to `ENABLED_PDBS_ON_STANDBY="-*", "PDB1", "PDB2"`. It means that a PDB name that does not match any patterns is not allowed to be part of the standby.

Examples

These examples assumes that nine new PDBs named PDB1A, PDB1B, PDB1C, PDB2A, PDB2B, PDB2C, PDB3A, PDB3B, and PDB3C are being added to the primary database.

1. If STANDBY1 sets `ENABLED_PDBS_ON_STANDBY="*"` on STANDBY1, then all nine PDBs will be created on STANDBY1.
2. If STANDBY1 sets `ENABLED_PDBS_ON_STANDBY="PDB1*"` on STANDBY1, then PDB1A, PDB1B, and PDB1C will be created on STANDBY1.
3. If STANDBY1 sets `ENABLED_PDBS_ON_STANDBY="PDB*A"` on STANDBY1, then PDB1A, PDB2A, and PDB3A will be created on STANDBY1.
4. If STANDBY1 sets `ENABLED_PDBS_ON_STANDBY="PDB1*", "-PDB*A"` on STANDBY1, then PDB1B and PDB1C will be created on STANDBY1.
5. If STANDBY1 sets `ENABLED_PDBS_ON_STANDBY="*", "-PDB*A", "-PDB*B"` on STANDBY1, then PDB1C, PDB2C and PDB3C will be created on STANDBY1. All other PDBs match `"*"`, and the rightmost pattern has the higher precedence, so they are excluded on the standby.
6. If STANDBY1 sets `ENABLED_PDBS_ON_STANDBY="*", "-PDB*A", "PDB2A"` on STANDBY1, then PDB1A and PDB3A are excluded, but all other PDBs including PDB2A will be created.

2.132 ENCRYPT_NEW_TABLESPACES

`ENCRYPT_NEW_TABLESPACES` specifies whether to encrypt newly created user tablespaces.

Property	Description
Parameter type	String
Syntax	<code>ENCRYPT_NEW_TABLESPACES = { CLOUD_ONLY ALWAYS DDL }</code>
Default value	<code>CLOUD_ONLY</code>
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	The same value should be specified for all instances.

The values that can be specified for the `ENCRYPT_NEW_TABLESPACES` parameter have the following meanings:

- `CLOUD_ONLY`:
When a user tablespace is created in the Oracle Cloud, it will be transparently encrypted if the `ENCRYPTION ... ENCRYPT` clause for the `SQL CREATE TABLESPACE` statement is not specified. The encryption algorithm is determined by the value of the `TABLESPACE_ENCRYPTION_DEFAULT_ALGORITHM` initialization parameter. When a user

tablespace is created in an on-premises database, the `ENCRYPTION` clause of the `CREATE TABLESPACE` statement determines if the tablespace is encrypted.

`CLOUD_ONLY` is the default value.

- **ALWAYS:**

Whether the user tablespace is created in the Oracle Cloud or in an on-premises database, the tablespace will be transparently encrypted if the `ENCRYPTION ... ENCRYPT` clause is not specified in the `CREATE TABLESPACE` statement. The encryption algorithm is determined by the value of the `TABLESPACE_ENCRYPTION_DEFAULT_ALGORITHM` initialization parameter.

- **DDL:**

Whether the user tablespace is created in the Oracle Cloud or in an on-premises database, the `CREATE TABLESPACE` statement follows the specified DDL. If no `ENCRYPTION` clause is specified, then the tablespace will not be encrypted. If the `ENCRYPTION USING ... ENCRYPT` clause is specified, then the specified algorithm will be used to encrypt the tablespace. If `ENCRYPTION ENCRYPT` is specified, but no algorithm is specified, then the encryption algorithm is determined by the value of the `TABLESPACE_ENCRYPTION_DEFAULT_ALGORITHM` initialization parameter.

 Note:

`ENCRYPT_NEW_TABLESPACES` is deprecated in Oracle Database 23ai and may be removed in a future release. Oracle recommends that you use the `TABLESPACE_ENCRYPTION` initialization parameter instead.

 See Also:

- [TABLESPACE_ENCRYPTION](#)
- [TABLESPACE_ENCRYPTION_DEFAULT_ALGORITHM](#)
- *Oracle Database Transparent Data Encryption Guide* for more information about tablespace encryption
- *Oracle Database SQL Language Reference* for more information about the `CREATE TABLESPACE` statement

2.133 ERROR_MESSAGE_DETAILS

Use `ERROR_MESSAGE_DETAILS` to control whether the database raises an additional stacked error message, with further details about the data values encountering the error, when displaying error messages.

Property	Description
Parameter type	String
Syntax	<code>ERROR_MESSAGE_DETAILS = { ON OFF DISALLOWED }</code>
Default value	ON

Property	Description
Modifiable	<code>ALTER SESSION</code> can be used to set this parameter to <code>ON</code> or <code>OFF</code> . <code>ALTER SYSTEM</code> can be used to set this parameter to <code>ON</code> , <code>OFF</code> , or <code>DISALLOWED</code> .
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Different instances can use different values.

This parameter allows you to instruct the database to show or omit explanatory details about data values causing an error. Providing this information usually makes it easier for the user to understand why the error occurred. If this is not desired, this parameter can be used to omit these additional details.

The detailed error message is being raised as a stacked error, meaning that applications will see the root cause error as the main error and will have to further traverse the stack to gain insights into the details. SQL command line tools will automatically traverse the entire stack and print the entire error message stack.

You can set this parameter for the database instance or PDB with the `ALTER SYSTEM` statement, or for the current session with the `ALTER SESSION` statement, using these values:

- `ON`: The database will provide additional explanatory details when displaying error messages. This is the default.
- `OFF`: The database will not provide additional explanatory details. This is the behavior prior to Oracle Database 23ai.

Additionally, you can set the following value only at the database instance or PDB level with the `ALTER SYSTEM` statement:

- `DISALLOWED`: The database will not provide additional explanatory details, and users cannot override this behavior for the current session with the `ALTER SESSION` statement.

Note:

This parameter is available starting with Oracle Database 23ai.

2.134 EVENT

`EVENT` is a parameter used only to debug the system.

Property	Description
Parameter type	String
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	No
Basic	No

Do not alter the value of this parameter except under the supervision of Oracle Support Services staff.

2.135 EXTERNAL_KEYSTORE_CREDENTIAL_LOCATION

`EXTERNAL_KEYSTORE_CREDENTIAL_LOCATION` specifies the location of the secure external keystore.

Property	Description
Parameter type	String
Syntax	<code>EXTERNAL_KEYSTORE_CREDENTIAL_LOCATION = file-location</code>
Default value	No default value
Modifiable	No
Modifiable in a PDB	No
Basic	No
Oracle RAC	This parameter can be set on each instance. Oracle recommends that if the instances have a shared location, then use a directory on the shared location for this parameter and set the same value on all Oracle RAC instances. If the database does not have a shared location, then each instance of the database will have its own directory and the value should be set per-instance.

TDE keystore credentials can be stored in a secure external keystore to automate Transparent Data Encryption (TDE) operations.

To automate the setting of the Master Key in a newly-provisioned PDB, set `EXTERNAL_KEYSTORE_CREDENTIAL_LOCATION` so that the CDB knows the location of the secure external keystore.

When a file specification is set with this parameter, the secure external keystore is looked for in that location. If the secure external keystore is not found in that location, then this parameter is ignored.

See Also:

Oracle Database Transparent Data Encryption Guide for more information about using TDE

2.136 FAL_CLIENT

`FAL_CLIENT` specifies the FAL (fetch archive log) client name that is used by the FAL service, configured through the `FAL_SERVER` initialization parameter, to refer to the FAL client.

Property	Description
Parameter type	String
Syntax	<code>FAL_CLIENT = string</code>
Default value	There is no default value.
Modifiable	ALTER SYSTEM

Property	Description
Modifiable in a PDB	No
Basic	No

The value is an Oracle Net service name, which is assumed to be configured properly on the FAL server system to point to the FAL client (standby database).

**See Also:**

Oracle Data Guard Concepts and Administration for more information about FAL server

2.137 FAL_SERVER

FAL_SERVER specifies the FAL (fetch archive log) server for a standby database.

Property	Description
Parameter type	String
Syntax	FAL_SERVER = <i>string</i>
Default value	There is no default value.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

The value is an Oracle Net service name, which is assumed to be configured properly on the standby database system to point to the desired FAL server.

**See Also:**

Oracle Data Guard Concepts and Administration for more information about FAL server

2.138 FAST_START_MTTR_TARGET

FAST_START_MTTR_TARGET enables you to specify the number of seconds the database takes to perform crash recovery of a single instance.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No

Property	Description
Range of values	0 to 3600 seconds
Basic	No
Oracle RAC	Multiple instances can have different values, and you can change the values at run time.

When specified, `FAST_START_MTTR_TARGET` is overridden by `LOG_CHECKPOINT_INTERVAL`.

 See Also:

- *Oracle Database Performance Tuning Guide* for an example of setting the lower bound for this parameter
- *Oracle Database Performance Tuning Guide* for an example of setting the upper bound for this parameter
- *Oracle Database Performance Tuning Guide* for an example of selecting a preliminary value for this parameter

2.139 FAST_START_PARALLEL_ROLLBACK

`FAST_START_PARALLEL_ROLLBACK` specifies the degree of parallelism used when recovering terminated transactions.

Property	Description
Parameter type	String
Syntax	<code>FAST_START_PARALLEL_ROLLBACK = { HIGH LOW FALSE }</code>
Default value	LOW
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No

Terminated transactions are transactions that are active before a system failure. If a system fails when there are uncommitted parallel DML or DDL transactions, then you can speed up transaction recovery during startup by using this parameter.

Values

- FALSE
Parallel rollback is disabled
- LOW
Limits the maximum degree of parallelism to $2 * \text{CPU\_COUNT}$
- HIGH
Limits the maximum degree of parallelism to $4 * \text{CPU\_COUNT}$

If you change the value of this parameter, then transaction recovery will be stopped and restarted with the new implied degree of parallelism.

**See Also:**

Oracle Database VLDB and Partitioning Guide for more information about this parameter

2.140 FILE_MAPPING

FILE_MAPPING specifies whether file mapping is enabled.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	true false
Basic	No

**Note:**

The FILE_MAPPING initialization parameter is deprecated. It is still supported for backward compatibility.

The FMON background process is started to manage the mapping information when file mapping is enabled.

**See Also:**

Oracle Database Administrator's Guide for more information about the file mapping feature

2.141 FILEIO_NETWORK_ADAPTERS

FILEIO_NETWORK_ADAPTERS specifies a list of network adapters that can be used to access the disk storage.

Property	Description
Parameter type	String
Syntax	FILEIO_NETWORK_ADAPTERS = <i>adapter_name</i> [, <i>adapter_name</i>] ...

Property	Description
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	No
Range of values	One or more network adapter names, separated by commas
Basic	No

On platforms where the database files reside in network attached storage, this parameter provides the storage access library the list of network adapters that can be used to access the storage.

The network adapter name is a fully qualified address name of the network card that can be accessed through the host name database or using the Network Information Service. The components of the adapter name are separated by periods. For example, the following is a fully qualified adapter name:

```
ib1.oracle.com
```

2.142 FILESYSTEMIO_OPTIONS

FILESYSTEMIO_OPTIONS specifies I/O operations for file system files.

Property	Description
Parameter type	String
Syntax	FILESYSTEMIO_OPTIONS = { none setall directIO asynch }
Default value	Varies by database version and operating system.
Modifiable	No
Modifiable in a PDB	No
Basic	No

See Also:

Oracle Database Performance Tuning Guide for information about setting this parameter before running I/O calibration

2.143 FIXED_DATE

FIXED_DATE enables you to set a constant date that SYSDATE will always return instead of the current date.

Property	Description
Parameter type	String
Syntax	FIXED_DATE = [YYYY-MM-DD-HH24:MI:SS (or the default Oracle date format) NONE]

Property	Description
Default value	There is no default value.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No

To undo a fixed date setting, specify `FIXED_DATE=NONE`. This parameter is useful primarily for testing. The value can be in the format shown above or in the default Oracle date format, without a time.

2.144 FORWARD_LISTENER

`FORWARD_LISTENER` specifies the name of a listener to which a connection must be forwarded by an existing set of remote listeners.

Property	Description
Parameter type	String
Syntax	<code>FORWARD_LISTENER = listener-name</code>
Default value	NULL
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	A different value can be set on different instances.

The parameter is useful when it is difficult to change an existing client connect string, for example, after an offsite database has been moved into the Oracle Cloud. With the `FORWARD_LISTENER` parameter, clients can continue to connect to their offsite listener, and the offsite listener forwards the connection to the Oracle Cloud listener.

Once a forward listener has been configured through the `FORWARD_LISTENER` parameter, the `LOCAL_LISTENER` parameter can be cleared by setting its value to `-oracle-none-` so that all the connections coming to an existing set of remote listeners configured through the `REMOTE_LISTENER` parameter are forwarded only to listeners configured through `FORWARD_LISTENER`.

The `FORWARD_LISTENER` parameter can also be specified in the `LISTENER_NETWORKS` parameter.

Examples

The following setup can be used to forward all the database connections coming to an existing customer SCAN listener to the Oracle Cloud SCAN listener.

```
REMOTE_LISTENER=customer-scan  
FORWARD_LISTENER=oracle-cloud-scan  
LOCAL_LISTENER=oracle-none-
```

**See Also:**

- "LOCAL_LISTENER"
- "REMOTE_LISTENER"
- "LISTENER_NETWORKS"
- *Oracle Clusterware Administration and Deployment Guide* for information about SCAN listeners

2.145 GCS_SERVER_PROCESSES

`GCS_SERVER_PROCESSES` specifies the number of background GCS server processes (LMS n and LM nn) to serve the inter-instance traffic among Oracle RAC instances.

If there is high Cache Fusion congestion on the system, the number of GCS server processes could be increased to reduce Cluster wait time. Additionally, the number of GCS server processes could be increased to reduce the application brownout time associated with Cluster reconfiguration and Dynamic Re-mastering (DRM).

Property	Description
Parameter type	Integer
Default value	Oracle calculates the default value as follows (in order of precedence): 1. If <code>CLUSTER_DATABASE</code> is set to <code>false</code>, then 0 2. If Oracle ASM, then 1 3. If 1 - 3 CPUs, then 1 4. If 4 - 15 CPUs, then 2 5. If 128 or more CPUs and SGA is 100 GB or more, then (CPUs / 6). If the result includes a fraction, then the fraction is disregarded. 6. Otherwise, the value is $2 + (\text{CPUs} / 32)$. If the result includes a fraction, then the fraction is disregarded. For example, if you have 20 CPUs, then $2 + (20 / 32)$ would equal 2 GCS processes. 7. On NUMA-enabled systems with 32 or more CPUs, the value is rounded up to a multiple of the number of NUMA processor groups, with a limit of (CPUs / 4) rounded down to a multiple of the number of NUMA processor groups.
Modifiable	No
Modifiable in a PDB	No
Range of values	0 if Oracle RAC is disabled (<code>CLUSTER_DATABASE</code> is set to <code>false</code>) 1 to 100 if Oracle RAC is enabled (<code>CLUSTER_DATABASE</code> is set to <code>true</code>)
Basic	No
Oracle RAC	Multiple instances can have different values.

GCS server processes are only seen in an Oracle RAC environment.

2.146 GLOBAL_NAMES

GLOBAL_NAMES specifies whether a database link is required to have the same name as the database to which it connects.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No

If the value of GLOBAL_NAMES is false, then no check is performed. If you use or plan to use distributed processing, then Oracle recommends that you set this parameter to true to ensure the use of consistent naming conventions for databases and links in a networked environment.

See Also:

Oracle Database Administrator's Guide for more information on setting this parameter

2.147 GLOBAL_TXN_PROCESSES

GLOBAL_TXN_PROCESSES specifies the initial number of GTX_n background processes (GTX0, ... GTX9 and GTX_a, ... GTX_j) per instance to support global (XA) transactions in an Oracle RAC environment.

Property	Description
Parameter type	Integer
Default value	1
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to 20
Basic	No
Oracle RAC	Multiple instances can have different values.

If you want to disable the GTX_n background processes, then you must set GLOBAL_TXN_PROCESSES to 0 in your parameter file. Setting this parameter to 0 will disable the XA support on an Oracle RAC database. Error ORA-55712 will be returned if you try to run XA transactions on an Oracle RAC database with this parameter set to 0. You can change the setting to a nonzero value at run time to turn on the support for XA.

GLOBAL_TXN_PROCESSES is useful for systems that process global (XA) transactions heavily. You do not need to specify a value for this parameter since Oracle Database automatically

determines the number of processes and autotunes them, as necessary. GTXn background processes are only seen in an Oracle RAC environment.

**See Also:**

Oracle Database Development Guide for more information about this parameter

2.148 GROUP_BY_POSITION_ENABLED

GROUP_BY_POSITION_ENABLED controls whether a positive integer in a GROUP BY clause is treated as the ordinal position of an expression in the select list.

Property	Description
Parameter type	Boolean
Default value	FALSE
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	TRUE FALSE
Basic	No
Oracle RAC	The same value must be used on all instances.

In SQL `SELECT` statements, you can specify the `GROUP BY` clause when you want to group the selected rows that share a common value for an expression and return a single row of summary information for each group.

In previous releases, if you wanted to group rows according to the value of an expression in the select list, you specified the expression as it appeared in the select list. For example:

```
SELECT department_id, COUNT(*)
  FROM employees
 GROUP BY department_id;
```

Starting with Oracle Database 23ai, when `GROUP_BY_POSITION_ENABLED` is set to `TRUE`, you can specify `GROUP BY position`, where *position* is a positive integer that represents the ordinal position of an expression in the select list. For example, the following `SELECT` statement groups the selected rows by the value of `department_id`:

```
SELECT department_id, COUNT(*)
  FROM employees
 GROUP BY 1;
```

The following `SELECT` statement groups the selected rows, first by the value of `manager_id`, and then by the value of `hired_year`:

```
SELECT manager_id, EXTRACT(YEAR FROM hire_date) AS hired_year, COUNT(*)
  FROM employees
 GROUP BY 1, 2;
```

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

Oracle Database SQL Language Reference for more information about the `GROUP BY` clause of the `SELECT` statement

2.149 HASH_AREA_SIZE

`HASH_AREA_SIZE` specifies the maximum amount of memory, in bytes, to be used for hash joins.

Property	Description
Parameter type	Integer
Default value	Derived: $2 * \text{SORT\_AREA\_SIZE}$
Modifiable	<code>ALTER SESSION</code>
Modifiable in a PDB	No
Range of values	0 to operating system-dependent
Basic	No

**Note:**

Oracle does not recommend using the `HASH_AREA_SIZE` parameter unless the instance is configured with the shared server option. Oracle recommends that you enable automatic sizing of SQL working areas by setting `PGA_AGGREGATE_TARGET` instead. `HASH_AREA_SIZE` is retained for backward compatibility.

`HASH_AREA_SIZE` is relevant to parallel execution operations and to the query portion of DML or DDL statements.

**See Also:**

- *Oracle Database Concepts* for information on hash joins in general

2.150 HEARTBEAT_BATCH_SIZE

Use `HEARTBEAT_BATCH_SIZE` to configure the heartbeat batch size, which is the number of heartbeats sent during one heartbeat period.

Property	Description
Parameter type	Integer
Default value	5
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	2 to 100
Basic	No
Oracle RAC	Multiple instances must have the same value.

2.151 HEAT_MAP

Use `HEAT_MAP` to enable or disable both the Heat Map and Automatic Data Optimization (ADO) features.

Property	Description
Parameter type	String
Syntax	<code>HEAT_MAP = { ON OFF }</code>
Default value	OFF
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	If specified, use the same value on all instances

Setting the `HEAT_MAP` initialization parameter to `ON` causes the database to track read and write access of all segments, as well as modification of database blocks, due to DMLs and DDLs. These activities are not tracked for objects in the `SYSTEM` and `SYSAUX` tablespaces.

See Also:

- *Oracle Database VLDB and Partitioning Guide* for more information about enabling and disabling the Heat Map feature
- *Oracle Database VLDB and Partitioning Guide* for more information about Heat Map tracking

2.152 HI_SHARED_MEMORY_ADDRESS

HI_SHARED_MEMORY_ADDRESS specifies the starting address at run time of the system global area (SGA).

Property	Description
Parameter type	Integer
Default value	0
Modifiable	No
Modifiable in a PDB	No
Basic	No

This parameter is ignored on platforms that specify the SGA's starting address at linktime.

On 64-bit platforms, use HI_SHARED_MEMORY_ADDRESS to specify the high-order 32 bits of a 64-bit address. Use SHARED_MEMORY_ADDRESS to specify the low-order 32 bits of the address (see "[SHARED_MEMORY_ADDRESS](#)"). If both parameters are 0 or unspecified, the SGA address defaults to a platform-specific location.

2.153 HS_AUTOREGISTER

HS_AUTOREGISTER enables or disables automatic self-registration of Heterogeneous Services (HS) agents.

Property	Description
Parameter type	Boolean
Default value	true
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	true false
Basic	No

When enabled, information is uploaded into the server's data dictionary to describe a previously unknown agent class or a new agent version.

Oracle recommends that you set this parameter to `true`. Oracle incurs less overhead when establishing subsequent connections through the same agent if self-registered information is available in the server's data dictionary.

See Also:

Oracle Database Heterogeneous Connectivity User's Guide for more information about using HS agents

2.154 HYBRID_READ_ONLY

`HYBRID_READ_ONLY` enables or disables hybrid read-only mode for a pluggable database (PDB).

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No
Oracle RAC	Different instances can use different values.

Hybrid read-only mode allows a PDB to operate in read/write mode or read-only mode, depending on the type of user that is connected to the PDB. The PDB operates in read/write mode for CDB common users, and read-only mode for application common users and local users. Hybrid read-only mode allows CDB common users to perform patching and maintenance operations on an open PDB, while application common users and local users can use the PDB as if it were open in read-only mode.

- To enable hybrid read-only mode for a PDB, connect to the PDB and set `HYBRID_READ_ONLY` to `true`. The PDB must be in `READ WRITE` mode before you enable hybrid read-only mode.
- To disable hybrid read-only mode for a PDB, connect to the PDB and set `HYBRID_READ_ONLY` to `false`.

You can determine whether a PDB is in hybrid read-only mode by querying the `IS_HYBRID_READ_ONLY` column of the `V$CONTAINER_TOPOLOGY` view.

When a PDB is in hybrid read-only mode, the `OPEN_MODE` column in the `V$CONTAINERS` and `V$PDBS` views reflects the mode for the querying user, that is, the `OPEN_MODE` column returns `READ WRITE` when queried by a CDB common user, and `READ ONLY` when queried by an application common user or a local user.

Note:

This parameter is available starting with Oracle Database 23ai.

See Also:

"`V$CONTAINER_TOPOLOGY`"

2.155 IDENTITY_PROVIDER_CONFIG

Use `IDENTITY_PROVIDER_CONFIG` to configure the database to use Microsoft Azure Active Directory (Azure AD) as an external identity provider.

Property	Description
Parameter type	String
Syntax	<pre>IDENTITY_PROVIDER_CONFIG = '{ "application_id_uri" : "string", "tenant_id" : "string", "app_id" : "string" }'</pre> Where: • The <code>application_id_uri</code> value is obtained from the registered application, to be mapped in the JWT "aud" (audience) claim. It must be domain qualified and start with "https://" to specify the OCI database to access. • The <code>tenant_id</code> value is obtained from the tenant configuration and is also available on the database application registration overview page. • The <code>app_id</code> value is obtained from the registered resource application and is also available on the database application registration overview page.
Default value	None
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	The same value must be used on all instances.

This parameter is effective only when the database is enabled to use Azure AD as an external identity provider, that is, when the `IDENTITY_PROVIDER_TYPE` initialization parameter is set to `AZURE_AD`. You must use this parameter to specify Azure AD configuration settings.

Example:

```
ALTER SYSTEM SET IDENTITY_PROVIDER_CONFIG =  
'{ "application_id_uri" : "https://example.com/pdb1",  
  "tenant_id" : "111a1111-a11a-111a-11111111111a",  
  "app_id" : "11aa1a1-aaaa-1111-1111-1111aa11111" }'  
SCOPE=BOTH;
```

Note:

Setting the value of this parameter is only one step in a series of steps for configuring the database to use Azure AD. Refer to *Oracle Database Security Guide* for the complete steps before you set this parameter.

**Note:**

For additional information about using this parameter with Oracle Autonomous Database, refer to ["Use Azure Active Directory \(Azure AD\) with Autonomous Database"](#).

**Note:**

This parameter is not available to update directly for Oracle Autonomous Database Serverless.

**Note:**

This parameter is available in Oracle Database 19c, starting with version 19.16, and in Oracle Database 23ai. This parameter is not available in Oracle Database 21c.

**See Also:**

["IDENTITY_PROVIDER_TYPE"](#)

2.156 IDENTITY_PROVIDER_TYPE

IDENTITY_PROVIDER_TYPE specifies an external identity provider for the database.

Property	Description
Parameter type	String
Syntax	IDENTITY_PROVIDER_TYPE = { AZURE_AD OCI_IAM NONE }
Default value	NONE
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	The same value must be used on all instances.

Values:

- **AZURE_AD** - Enables the database to use Microsoft Azure Active Directory (Azure AD) as an external identity provider.

When you specify this value, you must also specify configuration settings for Azure AD by setting the `IDENTITY_PROVIDER_CONFIG` initialization parameter.

- **OCI_AM** - Enables the database to use Oracle Cloud Infrastructure Identity and Access Management (OCI IAM) as an external identity provider.

When you specify this value, there is no need to specify configuration settings with the `IDENTITY_PROVIDER_CONFIG` initialization parameter.

- `NONE` - The database will not use Azure AD or OCI IAM as an external identity provider.

**Note:**

Setting the value of this parameter is only one step in a series of steps for configuring an external identity provider for the database. Refer to *Oracle Database Security Guide* for the complete set of steps for configuring Azure AD or OCI IAM before you set this parameter value.

**Note:**

The following resources offer additional information about using this parameter with Oracle Autonomous Database:

- ["Use Azure Active Directory \(Azure AD\) with Autonomous Database"](#)
- ["Use Identity and Access Management \(IAM\) Authentication with Autonomous Database"](#)

**Note:**

This parameter is not available to update directly for Oracle Autonomous Database Serverless.

**Note:**

This parameter is available in Oracle Database 19c, starting with version 19.16, and in Oracle Database 23ai. This parameter is not available in Oracle Database 21c.

**See Also:**

["IDENTITY_PROVIDER_CONFIG"](#)

2.157 IFILE

Use `IFILE` to embed another parameter file within the current parameter file.

Property	Description
Parameter type	Parameter file

Property	Description
Syntax	<code>IFILE = <i>parameter_file_name</i></code>
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	No
Range of values	Valid parameter filenames
Basic	No
Oracle RAC	Multiple instances can have different values.

For example:

```
IFILE = COMMON.ORA
```

You can have up to three levels of nesting. In this example, the file `COMMON.ORA` could contain a second `IFILE` parameter for the file `COMMON2.ORA`, which could contain a third `IFILE` parameter for the file `GCPARMS.ORA`. You can also include multiple parameter files in one parameter file by listing `IFILE` several times with different values:

```
IFILE = DBPARMS.ORA
IFILE = GCPARMS.ORA
IFILE = LOGPARMS.ORA
```

Note:

You must list multiple entries on contiguous lines of the parameter file.

2.158 IGNORE_SESSION_SET_PARAM_ERRORS

`IGNORE_SESSION_SET_PARAM_ERRORS` controls whether the database ignores errors when clients attempt to modify session parameter values.

Property	Description
Parameter type	String
Syntax	<code>IGNORE_SESSION_SET_PARAM_ERRORS = <i>parameter_name</i> [, <i>parameter_name</i>] ...</code>
Default value	None
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Multiple instances should use the same value.

The `IGNORE_SESSION_SET_PARAM_ERRORS` parameter allows you to change the outcome of the following scenario:

1. An Oracle database uses PDB lockdown profiles to prevent certain initialization parameters from being modified with the `ALTER SESSION` statement.

2. A database client attempts to modify one of those parameters with the `ALTER SESSION` statement. The client has no knowledge that the parameter is locked down.
3. The database returns an error to the client.

To prevent the database from returning an error in the preceding scenario, set the value of `IGNORE_SESSION_SET_PARAM_ERRORS` to a comma-separated list of locked down initialization parameters. Thereafter, if a client attempts to modify one of those parameters with the `ALTER SESSION` statement, the database will ignore the modification attempt and indicate to the client that the operation was successful.

You can set the `IGNORE_SESSION_SET_PARAM_ERRORS` parameter while connected to a specific PDB, or you can apply it to all PDBs by setting it in the CDB root.

Example

The `CURSOR_INVALIDATION` and `CURSOR_SHARING` parameters are locked down in one of the PDBs in your database. If a client application attempts to modify either of these parameters, you want the database to ignore the request and allow the application to continue running without incurring an error. To achieve this, you can connect to the PDB and set the `IGNORE_SESSION_SET_PARAM_ERRORS` parameter. For example:

```
ALTER SYSTEM SET IGNORE_SESSION_SET_PARAM_ERRORS = CURSOR_INVALIDATION,  
CURSOR_SHARING;
```

2.159 INMEMORY_ADG_ENABLED

`INMEMORY_ADG_ENABLED` indicates whether in-memory for Active Data Guard is enabled in addition to the in-memory cache size.

Property	Description
Parameter type	Boolean
Default value	true
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	true false
Basic	No
Oracle RAC	The same value should be used on all instances. If the value for this parameter is changed on one instance, the parameter's value should be changed to the same value on the other instances.

For Active Data Guard, media recovery needs to retrieve in-memory objects when applying redo and to invalidate the related objects after the query advance. This parameter controls whether media recovery does the retrieving and invalidating.

This parameter should be set on standby databases. The value of this parameter is meaningless on a primary database.

If the standby is an Oracle RAC instance, then all the different standby instances must have this parameter set to the same value.

This parameter is a dynamic system-modifiable parameter whose value can be changed only when Active Data Guard recovery is not running.

If you start multi-instance redo apply (MIRA) Active Data Guard recovery, all instances involved in MIRA must have the parameter set to the same value, otherwise MIRA will signal an error.

Example

If the standby is an Oracle RAC instance, this parameter should be set to the same value on all the Oracle RAC instances:

```
SQL> alter system set inmemory_adg_enabled=true sid='*';
```

See Also:

- "INMEMORY_SIZE"
- *Oracle Database In-Memory Guide* for more information about deploying an In-Memory Column Store (IM column store) in an Active Data Guard environment

2.160 INMEMORY_AUTOMATIC_LEVEL

INMEMORY_AUTOMATIC_LEVEL is used to enable the Automatic In-Memory feature, which automates the management of the In-Memory Column Store (IM column store) to help ensure that the working data set is in the IM column store at all times.

Property	Description
Parameter type	String
Syntax	INMEMORY_AUTOMATIC_LEVEL = { LOW MEDIUM HIGH OFF }
Default value	OFF
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	All instances should use the same value.

Typically, among all the IM enabled segments, only a subset is actively queried at any time. This subset is known as the working data set. The working data set is expected to change over time for many applications.

INMEMORY_AUTOMATIC_LEVEL attempts to keep the working data set in the IM column store at all times by moving segments in and out of the IM column store based on access patterns.

Oracle recommends that you provision enough memory for the working data set to fit in the IM column store.

The following values can be set:

- **LOW:** The database evicts cold segments from the IM column store when it is under memory pressure.
- **MEDIUM:** The database evicts cold segments from the IM column store when it is under memory pressure. This level includes an additional optimization that ensures that any hot segment that was not populated because of memory pressure is populated first.

- **HIGH:** All segments in the database are enabled for the IM column store, except segments belonging to Oracle-maintained users and segments from external tables. Automatic In-Memory manages all segments enabled for the IM column store, keeping hot segments in the IM column store and evicting cold segments. This level includes an additional optimization that ensures that any hot segment that was not populated because of memory pressure is populated first.
- **OFF:** Automatic In-Memory is disabled. This value returns the IM column store to the behavior that existed prior to Oracle Database 18c, when the Automatic In-Memory features was introduced. If you do not expect a stable working data set, set the parameter to **OFF**. This is the default value.

See Also:

- *Oracle Database Licensing Information User Manual* to learn which database offerings support the Automatic In-Memory feature
- *Oracle Database In-Memory Guide* for more information about configuring the Automatic In-Memory feature

2.161 INMEMORY Clause DEFAULT

INMEMORY Clause DEFAULT enables you to specify a default In-Memory Column Store (IM column store) clause for new tables and materialized views.

Note:

The setting of this parameter has no effect on In-Memory external tables or hybrid partitioned tables.

Property	Description
Parameter type	String
Syntax	<code>INMEMORY Clause DEFAULT = '[INMEMORY] [NO INMEMORY] [other-clauses]'</code>
Syntax	other-clauses::= [compression-clause] [priority-clause] [rac-clause]
Syntax	compression-clause::= NO MEMCOMPRESS MEMCOMPRESS FOR { DML QUERY [LOW HIGH] CAPACITY [LOW HIGH] } ¹
Syntax	priority-clause::= PRIORITY { LOW MEDIUM HIGH CRITICAL NONE } ¹
Syntax	rac-clause::= [distribute-clause] [duplicate-clause] ¹
Syntax	distribute-clause::= DISTRIBUTE [AUTO BY ROWID RANGE] ¹

Property	Description
Syntax	duplicate-clause::= NO DUPLICATE DUPLICATE [ALL] ¹
Default value	An empty string
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	All instances should use the same value

¹ See [Table 2-2](#) for more information about this clause.

If the `INMEMORY_CLAUSE_DEFAULT` parameter is unset or set to an empty string (the default), only tables and materialized views explicitly specified as `INMEMORY` will be populated into the IM column store. Setting the value of the `INMEMORY_CLAUSE_DEFAULT` parameter to `NO INMEMORY` has the same effect as setting it to the default value.

If the `INMEMORY_CLAUSE_DEFAULT` parameter is set, then any *newly created* table or materialized view specified as `INMEMORY` will inherit unspecified attributes from this parameter. This can force certain in-memory options by default that are not explicitly specified in the syntax. For example, if the `INMEMORY_CLAUSE_DEFAULT` parameter is set to `MEMCOMPRESS FOR CAPACITY LOW` and a table is created as `INMEMORY PRIORITY HIGH`, then the table is treated as if it was declared as `INMEMORY MEMCOMPRESS FOR CAPACITY LOW PRIORITY HIGH`.

If `INMEMORY` is specified as part of this parameter, then all newly created tables and materialized views will be populated into the IM column store, except tables and materialized views explicitly specified as `NO INMEMORY`. For example, if this parameter is set to `INMEMORY MEMCOMPRESS FOR CAPACITY HIGH`, then all new tables will be created as if this clause were present in the `SQL CREATE TABLE` statement. If there is a default `INMEMORY` value for the tablespace for a given segment, then it will override the value for this parameter.

Table 2-2 Meaning of INMEMORY_CLAUSE_DEFAULT Parameter Values

Syntax	Description
<code>INMEMORY</code>	Specifies that all newly-created tables and materialized views populate the IM column store unless they are specified as <code>NO INMEMORY</code> in the <code>SQL CREATE TABLE</code> or <code>CREATE MATERIALIZED VIEW</code> statement
<code>NO INMEMORY</code>	Specifies that only tables and materialized views explicitly specified as <code>INMEMORY</code> in the <code>SQL CREATE TABLE</code> or <code>CREATE MATERIALIZED VIEW</code> statements populate the IM column store
<code>compression-clause</code>	Specifies that in-memory compression should be used for the instance. Use the <code>MEMCOMPRESS FOR</code> values to specify the in-memory compression level.
<code>NO MEMCOMPRESS</code>	When <code>NO MEMCOMPRESS</code> is specified, no in-memory compression is done in the IM column store.
<code>MEMCOMPRESS FOR</code>	<code>MEMCOMPRESS FOR</code> is used to indicate the in-memory compression level for the IM column store.
<code>DML</code>	When <code>DML</code> is specified, the IM column store is optimized for DML operations, and some lightweight in-memory compression may be done.

Table 2-2 (Cont.) Meaning of INMEMORY Clause DEFAULT Parameter Values

Syntax	Description
QUERY	When QUERY is specified, the in-memory compression level is for high performance. If QUERY is specified without LOW or HIGH, it defaults to QUERY LOW.
QUERY LOW	When QUERY LOW is specified, the in-memory compression level provides the highest performance.
QUERY HIGH	When QUERY HIGH is specified, the in-memory compression level provides a balance between compression and performance, weighted toward performance.
CAPACITY	When CAPACITY is specified without LOW or HIGH, it defaults to CAPACITY LOW.
CAPACITY LOW	When CAPACITY LOW is specified, the in-memory compression level is a balance between compression and performance, weighted toward capacity.
CAPACITY HIGH	When CAPACITY HIGH is specified, the in-memory compression level is for highest capacity.
priority-clause	Specifies the priority to use when populating tables in the IM column store. Use the PRIORITY values to specify the priority. By default, the population of a table in the IM column store can be delayed until the database determines it is useful. On database instance startup, tables are populated in priority order.
PRIORITY NONE	When PRIORITY NONE is specified, the population of a table in the IM column store can be delayed until the database determines it is useful. This is the default value when no priority is specified.
PRIORITY LOW	When PRIORITY LOW is specified for a table or tables, the population of those tables in the IM column store is done before tables that have no priority specified.
PRIORITY MEDIUM	When PRIORITY MEDIUM is specified for a table or tables, the population of those tables in the IM column store is done before tables that have no priority and PRIORITY LOW specified.
PRIORITY HIGH	When PRIORITY HIGH is specified for a table or tables, the population of those tables in the IM column store is done before tables that have no priority, PRIORITY LOW, and PRIORITY MEDIUM specified.
PRIORITY CRITICAL	When PRIORITY CRITICAL is specified for a table or tables, the population of those tables in the IM column store is done before tables that have no priority, PRIORITY LOW, PRIORITY MEDIUM, and PRIORITY HIGH specified.
rac-clause	Specifies how tables in the IM column store will be managed among Oracle Real Application Clusters (Oracle RAC) instances. Use the distribute-clause and duplicate-clause to specify how tables in the IM store will be managed in Oracle RAC instances. For a non-Oracle RAC database, these settings have no effect, because the whole table or partition has to be on the single instance.
distribute-clause	Specifies how a table is distributed among Oracle RAC instances.

Table 2-2 (Cont.) Meaning of INMEMORY Clause DEFAULT Parameter Values

Syntax	Description
DISTRIBUTE AUTO	Specifies that the database will automatically decide how to distribute tables in the IM column store across the Oracle RAC instances based on the type of partitioning and the value of the <code>duplicate_clause</code> . <code>DISTRIBUTE AUTO</code> is the default, and it is also used when <code>DISTRIBUTE</code> is specified by itself.
DISTRIBUTE BY ROWID RANGE	Specifies that the tables in the IM column store will be distributed by rowid range to different Oracle RAC instances.
<code>duplicate_clause</code>	Specifies how many copies of each In-Memory Compression Unit (IMCU) of the tables in the IM column store will be spread across all the Oracle RAC instances. Note: The <code>duplicate_clause</code> is only applicable if you are using Oracle Real Application Clusters (Oracle RAC) on an engineered system. Otherwise, the <code>duplicate_clause</code> is ignored and there is only one copy of each IMCU in memory.
NO DUPLICATE	Data is not duplicated across Oracle RAC instances. This is the default.
DUPLICATE	Data is duplicated on another Oracle RAC instance, resulting in data existing on a total of two Oracle RAC instances.
DUPLICATE ALL	Data is duplicated across all Oracle RAC instances. If you specify <code>DUPLICATE ALL</code> , then the database uses the <code>DISTRIBUTE AUTO</code> setting, regardless of whether or how you specify the <code>distribute_clause</code> .

Examples

The following statement causes no tables to populate the IM column store:

```
alter system set INMEMORY Clause DEFAULT='NO INMEMORY'
scope=both;
```

The following statement causes new tables and materialized views (except those specified as `NO INMEMORY`) to populate the IM column store at the high capacity compression level:

```
alter system set
INMEMORY Clause DEFAULT='INMEMORY MEMCOMPRESS FOR CAPACITY HIGH'
scope=both;
```

The following statement causes new tables (even those specified as `NO INMEMORY`) to populate the IM column store at the highest performance compression level at `LOW` priority:

```
alter system set
INMEMORY Clause DEFAULT='INMEMORY MEMCOMPRESS FOR QUERY LOW PRIORITY LOW'
scope=both;
```

The following statement causes new tables (even those specified as `NO INMEMORY`) to populate the IM column store without any in-memory compression:

```
alter system set
INMEMORY Clause DEFAULT='INMEMORY NO MEMCOMPRESS'
scope=both;
```

The following statement causes tables in the IM column store to be duplicated on every Oracle RAC instance, unless on a non-engineered system. For a non-engineered system, the

duplicate-clause (DUPLICATE ALL) will be ignored and tables in the column store will be automatically distributed across the Oracle RAC instance, with only one copy of each IMCU in the tables in the IM column store:

```
alter system set
INMEMORY Clause_DEFAULT='INMEMORY MEMCOMPRESS FOR QUERY
DISTRIBUTE AUTO DUPLICATE ALL'
scope=both;
```

The following statement sets the value of the `INMEMORY Clause_DEFAULT` parameter back to its default value, the empty string:

```
alter system set
INMEMORY Clause_DEFAULT=''
scope=both;
```

2.162 INMEMORY_DEEP_VECTORIZATION

`INMEMORY_DEEP_VECTORIZATION` enables or disables the deep vectorization framework.

Property	Description
Parameter type	Boolean
Default value	TRUE
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes

Property	Description
Range of values	TRUE FALSE
Basic	No

Deep vectorization can optimize complex SQL operations (such as joins) by pipelining physical operators inside each SQL operator and vectorizing them.

See Also:

Oracle Database In-Memory Guide for information about deep vectorization

2.163 INMEMORY_EXPRESSIONS_USAGE

INMEMORY_EXPRESSIONS_USAGE controls which In-Memory Expressions (IM expressions) are populated into the In-Memory Column Store (IM column store) and are available for queries.

Property	Description
Parameter type	String
Syntax	INMEMORY_EXPRESSIONS_USAGE = { STATIC_ONLY DYNAMIC_ONLY ENABLE DISABLE }
Default value	ENABLE
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	The same value must be used on all instances.

The four values for this parameter are:

- **STATIC_ONLY:** Tables enabled for in-memory and containing certain data types such as Oracle numbers or JSON will have these columns populated in the IM column store using a more efficient representation. Note that this setting will increase the in-memory footprint for some tables. A static configuration enables the IM column store to cache OSON (binary JSON) columns, which are marked with an IS_JSON check constraint. Internally, an OSON column is a hidden virtual column named SYS_IME_OSON. In contrast, a dynamic configuration automatically creates and populates frequently used expressions.
- **DYNAMIC_ONLY:** IM expressions will be automatically created and populated into the IM column store, if used in conjunction with PL/SQL procedure `DBMS_INMEMORY.IME_CAPTURE_EXPRESSIONS`. Note that setting this value will increase the in-memory footprint for some tables.
- **ENABLE:** Both static and dynamic IM expressions will be populated into the IM column store and available to be used by queries. Note that setting this value will increase the in-memory footprint for some tables. This is the default value.
- **DISABLE:** No IM expressions of any kind will be populated into the IM column store.

Changing the mode of a parameter does not have an immediate effect on existing in-memory data. For example, if the `inmemory_expressions_usage` clause is changed from `DYNAMIC_ONLY`

to `DISABLE`, the stored IM expressions are not immediately removed. The next repopulation will not bring back the expressions in memory, thereby effectively removing the expressions.

 See Also:

- ["INMEMORY_VIRTUAL_COLUMNS"](#)
- *Oracle Database In-Memory Guide* for more information about IM expressions
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_INMEMORY` PL/SQL package

2.164 INMEMORY_FORCE

`INMEMORY_FORCE` allows you to specify whether objects, such as tables, materialized views, and partitions, that are specified as `INMEMORY` are populated into the In-Memory Column Store (IM column store) or not.

Property	Description
Parameter type	String
Syntax	<code>INMEMORY_FORCE = { DEFAULT OFF BASE_LEVEL CELLMEMORY_LEVEL }</code>
Default value	DEFAULT
Modifiable	You can use <code>ALTER SYSTEM</code> to dynamically modify this parameter setting as follows: • From <code>DEFAULT</code> to <code>OFF</code> • From <code>OFF</code> to <code>DEFAULT</code> • From <code>BASE_LEVEL</code> to <code>DEFAULT</code> • From <code>CELLMEMORY_LEVEL</code> to <code>DEFAULT</code> • From <code>CELLMEMORY_LEVEL</code> to <code>OFF</code> All other modifications of this parameter require you to update the initialization file and restart the instance.
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	All instances should use the same value.

The following values can be set:

- `DEFAULT`
The IM column store is populated with objects that are specified as `INMEMORY`.
- `OFF`
Even if the IM column store is configured on this instance, no objects are populated in memory.
- `BASE_LEVEL`

Enables Database In-Memory Base Level. The Base Level lets you to experiment with Oracle Database In-Memory features without purchasing the Oracle Database In-Memory option.

When the Base Level is enabled, the value of the `INMEMORY_SIZE` initialization parameter is limited to 16 GB for a CDB. In an Oracle RAC environment, the value of `INMEMORY_SIZE` is limited to 16 GB for each instance. The compression level for all objects and columns is automatically and transparently set to `QUERY LOW`. Automatic In-Memory is disabled, and In-Memory Column Store feature tracking is tracked for "In-Memory Base Level" rather than "In-Memory Column Store." The CellMemory feature is disabled for Oracle Exadata.

- `CELLMEMORY_LEVEL`

CellMemory is an Exadata feature that allows you to use Exadata Smart Flash Cache to populate data in in-memory columnar format. In older releases of Oracle Database, in order to use the CellMemory feature, you were required to enable the IM column store (by setting `INMEMORY_SIZE` to a value greater than 0), even if you had no intention of using the IM column store. This incurred the overhead of enabling the IM column store without any benefit. Starting with Oracle Database release 19c, version 19.8, you can use the CellMemory feature without enabling the IM column store by setting `INMEMORY_FORCE=CELLMEMORY_LEVEL` and `INMEMORY_SIZE=0`. With these settings, the IM column store is not enabled and queries can use CellMemory to scan objects.

Note that if the value of `INMEMORY_SIZE` is greater than 0, then setting `INMEMORY_FORCE=CELLMEMORY_LEVEL` is equivalent to setting `INMEMORY_FORCE=DEFAULT`. The IM column store is enabled, even if you only use CellMemory.

2.165 INMEMORY_MAX_POPULATE_SERVERS

`INMEMORY_MAX_POPULATE_SERVERS` specifies the maximum number of background populate servers to use for In-Memory Column Store (IM column store) population, so that these servers do not overload the rest of the system.

Property	Description
Parameter type	Integer

Property	Description
Default value	Half of the value of <code>CPU_COUNT</code> or the <code>PGA_AGGREGATE_TARGET</code> value divided by 512M, whichever is less. See the " CPU_COUNT " description for information about how <code>CPU_COUNT</code> is calculated.
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	No
Range of values	0 to a value based on the number of cores in the system.
Basic	No
Oracle RAC	All instances should use the same value.

This parameter has meaning only if the `INMEMORY_SIZE` parameter is also set to a positive value.

The value to use for this parameter depends on the number of cores in the system. A certain percentage of CPU should be allocated for in-memory background population, and this parameter should be set accordingly. You can also set this parameter to 0 to temporarily disable populate tasks on the system from executing.

**Note:**

Be careful not to set the value of this parameter too high. If it is set close to the number of cores or higher, no CPU could be left for the rest of the system to run.

**Note:**

The IM column store is not populated if this parameter is set to 0.

2.166 INMEMORY_OPTIMIZED_ARITHMETIC

INMEMORY_OPTIMIZED_ARITHMETIC encodes the NUMBER data type in in-memory tables compressed with QUERY LOW as a fixed-width native integer scaled by a common exponent.

Property	Description
Parameter type	String
Syntax	INMEMORY_OPTIMIZED_ARITHMETIC = { ENABLE DISABLE }
Default value	DISABLE
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Different values can be specified on different instances.

The Oracle Database NUMBER format can incur a significant performance overhead when executing queries because arithmetic operations cannot be performed natively in hardware.

When INMEMORY_OPTIMIZED_ARITHMETIC is set to ENABLE, for tables compressed with QUERY LOW, NUMBER columns are encoded as a fixed-width native integer scaled by a common exponent. This In-Memory optimized number format enables fast calculations using SIMD hardware. By using SIMD vector processing, arithmetic operations, simple aggregations, and group-by aggregations can benefit significantly.

Not all row sources in the query processing engine have support for the In-Memory optimized number format. Therefore, the IM column store must store both the traditional Oracle Database NUMBER data type and the In-Memory optimized number type. This means that the acceleration in analytic query performance comes at a cost of increased space overhead.

When INMEMORY_OPTIMIZED_ARITHMETIC is set to DISABLE (the default), the database does not use the optimized encoding.

If INMEMORY_OPTIMIZED_ARITHMETIC is set to ENABLE and then to DISABLE, the optimized number format for existing IMCUs is not dropped immediately. Instead, as the IM column store repopulates IMCUs, the new IMCUs do not use the optimized encoding.

See Also:

Oracle Database In-Memory Guide for details about the improved performance and increased space overhead when INMEMORY_OPTIMIZED_ARITHMETIC is enabled

2.167 INMEMORY_OPTIMIZED_DATE

Use INMEMORY_OPTIMIZED_DATE to enable or disable the In-Memory Optimized Dates feature.

Property	Description
Parameter type	String
Syntax	INMEMORY_OPTIMIZED_DATE = { ENABLE DISABLE }

Property	Description
Default value	DISABLE
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Different instances can use different values.

When this parameter is set to `ENABLE`, In-Memory can run date-based analytic queries much faster by leveraging the In-Memory Expressions framework.

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

Oracle Database In-Memory Guide for more information about the In-Memory Optimized Dates feature

2.168 INMEMORY_QUERY

`INMEMORY_QUERY` is used to enable or disable in-memory queries for the entire database at the session or system level.

Property	Description
Parameter type	String
Syntax	<code>INMEMORY_QUERY = { ENABLE DISABLE }</code>
Default value	ENABLE
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	All instances should use the same value.

This parameter is helpful when you want to test workloads with and without the use of the In-Memory Column Store (IM column store).

This parameter enables in-memory queries for the entire database by default when the `INMEMORY_SIZE` parameter is specified.

Set this parameter to `DISABLE` if you want to disable in-memory queries.

**See Also:**

- ["INMEMORY_CLAUSE_DEFAULT"](#)
- ["INMEMORY_FORCE"](#)
- ["INMEMORY_MAX_POPULATE_SERVERS"](#)
- ["INMEMORY_SIZE"](#)
- *Oracle Database In-Memory Guide* for an introduction to the IM column store
- *Oracle Database In-Memory Guide* for more information about the IM column store

2.169 INMEMORY_SIZE

`INMEMORY_SIZE` sets the size of the In-Memory Area, which contains the IM Column Store (IM column store) on a database instance.

Property	Description
Parameter type	Big integer
Syntax	<code>INMEMORY_SIZE = integer [K M G]</code>
Default value	0
Modifiable	You can use <code>ALTER SYSTEM</code> to increase or decrease the value of this parameter. However, the value of this parameter must always be greater than or equal to its value at instance startup.
Modifiable in a PDB	Yes
Range of values	0 to the amount of memory left in the SGA after other allocations A value of 0 specifies that the IM column store is not allocated and no In-Memory features are enabled. A value greater than 0 and less than 100M specifies that the IM column store is enabled for future growth, but no memory is currently provisioned to the In-Memory Area.
Basic	No
Oracle RAC	All instances should use the same value.

The database must be restarted after setting this parameter to enable the IM column store.

Typically this parameter should be set to at least the size needed to accommodate all the tables that will use the IM column store. It can be set higher to allow for growth of those tables or to accommodate other tables that will use the IM column store in the future.

This parameter can also be set per PDB to limit the maximum size of the IM column store for that PDB. Note that the sum of the PDB values do not have to equal the CDB value, and the sum of the PDB values may even be greater than the CDB value.

Unless this parameter is specifically set on a PDB, each PDB inherits the CDB value, which means they can use all of the available IM column store.

The value specified for this parameter counts toward `SGA_TARGET`. For example, if you set `SGA_TARGET` to 10 GB and you set `INMEMORY_SIZE` to 2 GB, then 20% of the `SGA_TARGET` setting is allocated to the In-Memory Area.

Starting with Oracle Database 23ai, Automatic In-Memory Sizing can automatically grow or shrink the In-Memory Area based on the benefits of the column store if the following conditions are true:

- `SGA_TARGET > 0`
- `INMEMORY_AUTOMATIC_LEVEL = MEDIUM` or `HIGH`
- `VECTOR_MEMORY_SIZE` is set to 0 or not specified

In-Memory Dynamic Scans require the Resource Manager. Therefore, the Resource Manager is automatically enabled when you change the value of `INMEMORY_SIZE` from 0 to a non-zero value. No specific resource plan is required.

Database In-Memory Base Level allows a maximum of 16 GB for the size of the In-Memory Area. Therefore, if Database In-Memory Base Level is enabled (the value of the `INMEMORY_FORCE` initialization parameter is set to `BASE_LEVEL`), then the value of `INMEMORY_SIZE` cannot exceed 16 GB for a CDB. In an Oracle RAC environment, the value of `INMEMORY_SIZE` is limited to 16 GB for each instance.

2.170

INMEMORY_TRICKLE_REPOPULATE_SERVERS_PERCENT

`INMEMORY_TRICKLE_REPOPULATE_SERVERS_PERCENT` limits the maximum number of background populate servers used for In-Memory Column Store (IM column store) repopulation, as trickle repopulation is designed to use only a small percentage of the populate servers.

Property	Description
Parameter type	Integer
Default value	1
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No

Property	Description
Range of values	0 to 50
Basic	No
Oracle RAC	All instances should use the same value.

The value for this parameter is a percentage of the `INMEMORY_MAX_POPULATE_SERVERS` initialization parameter value.

For example, if this parameter is set to 5 and `INMEMORY_MAX_POPULATE_SERVERS` is set to 10, then on average half of a core is used for trickle repopulation.

The default value of 1 is good in most cases. In some cases, if you want to disable trickle repopulate, this parameter can be set to 0. If you want to keep the system more aggressively up to date (at the expense of more background CPU), you can set the parameter to higher values such as 5 or 10.

A value of greater than 50 is not allowed, so that at least half of the populate servers are available for other (re)populate tasks. On some systems, a value of less than 50 can be problematic, depending on other workload.

This parameter has meaning only if the `INMEMORY_SIZE` parameter is also set to a positive value.

2.171 INMEMORY_VIRTUAL_COLUMNS

`INMEMORY_VIRTUAL_COLUMNS` controls which user-defined virtual columns are stored as In-Memory virtual columns (IM columns).

Property	Description
Parameter type	String
Syntax	<code>INMEMORY_VIRTUAL_COLUMNS = { ENABLE MANUAL DISABLE }</code>
Default value	MANUAL
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	The same value must be used on all instances.

IM virtual columns improve query performance by avoiding the necessity of repeated calculations. Also, the database can scan and filter IM virtual columns using techniques such as SIMD vector processing.

These values can be set for the parameter:

- **ENABLE:** For a table or partition that has been enabled for in-memory storage, all virtual columns will be stored in-memory at the default table or partition memcompress level unless:
 - They have been explicitly excluded using the no inmemory syntax.
 - They have been altered to have a different memcompress level than the base table or partition, in which case they will be stored at the specified memcompress level.

- **MANUAL:** This is the default value for the parameter. For a table or partition that has been enabled for in-memory storage, no virtual columns will be stored in-memory unless:
 - They have been explicitly marked for inmemory, in which case they will be stored in-memory at the table or partition memcompress level.
 - They have been marked for inmemory with a different memcompress level than the base table or partition, in which case they will be stored at the specified memcompress level.
- **DISABLE:** For a table or partition that has been enabled for in-memory storage, no virtual columns will ever be stored in-memory. Any changes to the inmemory_column_clause for a virtual column including changes in memcompress level will be recorded, but not acted upon with regards to population of virtual columns.

 See Also:

- ["INMEMORY_EXPRESSIONS_USAGE"](#)
- *Oracle Database In-Memory Guide* for more information about IM virtual columns

2.172 INSTANCE_ABORT_DELAY_TIME

`INSTANCE_ABORT_DELAY_TIME` specifies how much time to delay an internal initiated instance termination (in seconds), such as when an irrecoverable process dies or an irrecoverable instance error occurs.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 and higher
Basic	No
Oracle RAC	Different instances should use the same value.

This parameter does not apply to a `SHUTDOWN ABORT` operation or any instance termination necessary to implement a user command.

Setting this parameter to a value greater than 0 enables a DBA to take some actions before a termination occurs due to an irrecoverable error. Note that since the instance is in an irrecoverable state, the DBA should not be too ambitious with the actions taken because some processes and/ or resources may be corrupted or unavailable, making complex actions impossible. Oracle does not guarantee what it is possible when an instance is in this state. A message is written to the alert log when the delayed termination is initiated. The value will not apply in the case of PMON death.

The larger the specified value, the longer the instance stays up, and the potential increases for other problems to occur. If you set this parameter, Oracle recommends setting it to a value between 0 and 60.

2.173 INSTANCE_GROUPS

Used with the `PARALLEL_INSTANCE_GROUP` parameter, `INSTANCE_GROUPS` lets you restrict parallel query operations to a limited number of instances.

Property	Description
Parameter type	String
Syntax	<code>INSTANCE_GROUPS = group_name [, group_name] ...</code>
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	No
Range of values	One or more instance group names, separated by commas
Basic	No
Oracle RAC	Multiple instances can have different values.

Note:

The `INSTANCE_GROUPS` parameter is deprecated. It is retained for backward compatibility only.

`INSTANCE_GROUPS` is an Oracle RAC parameter that you can specify only in parallel mode.

This parameter specifies one or more instance groups and assigns the current instance to those groups. If one of the specified groups is also specified in the `PARALLEL_INSTANCE_GROUP` parameter, then Oracle allocates query processes for a parallel operation from this instance.

See Also:

- *Oracle Real Application Clusters Administration and Deployment Guide* for more information on parallel query execution in a Real Application Clusters environment
- ["PARALLEL_INSTANCE_GROUP"](#)

2.174 INSTANCE_MODE

`INSTANCE_MODE` indicates whether the instance is read-write, read-only, or read-mostly.

Property	Description
Parameter type	String
Syntax	<code>INSTANCE_MODE = { READ-WRITE READ-ONLY READ-MOSTLY }</code>
Default value	<code>READ-WRITE</code>
Modifiable	No

Property	Description
Basic	No
Oracle RAC	See the Oracle RAC restrictions in the initialization parameter description below.

A `READ-WRITE` instance is a regular Oracle instance.

A `READ-ONLY` instance is an Oracle instance that can only be opened in read-only mode.

A `READ-MOSTLY` instance is an Oracle instance that performs very few database writes.

These restrictions apply when setting the parameter on different Oracle Real Application Clusters (Oracle RAC) instances:

1. There must be at least one running instance with `INSTANCE_MODE` set to `READ-WRITE` at any given time. If the only instance with `INSTANCE_MODE` set to `READ-WRITE` goes down, all other instances will be brought down by Oracle automatically.
2. An instance with `INSTANCE_MODE` set to `READ-ONLY` cannot be the first instance to open a database or any pluggable database (PDB) among all instances in an Oracle RAC cluster.
3. Oracle does not support co-existence of an instance with `INSTANCE_MODE` set to `READ-ONLY` and an instance with `INSTANCE_MODE` set to `READ-MOSTLY` in the same Oracle RAC cluster.

2.175 INSTANCE_NAME

In an Oracle Real Application Clusters environment, multiple instances can be associated with a single database service. Clients can override Oracle's connection load balancing by specifying a particular instance by which to connect to the database. `INSTANCE_NAME` specifies the unique name of this instance.

Property	Description
Parameter type	String
Syntax	<code>INSTANCE_NAME = instance_id</code>
Default value	The instance's SID Note: The SID identifies the instance's shared memory on a host, but may not uniquely distinguish this instance from other instances.
Modifiable	No
Modifiable in a PDB	No
Range of values	Alphanumeric ASCII characters and the underscore (<code>_</code>) character, up to a maximum of 255 characters
Basic	No

In a single-instance database system, the instance name is usually the same as the database name.

**See Also:**

Oracle Real Application Clusters Administration and Deployment Guide and *Oracle Database Net Services Administrator's Guide* for more information

2.176 INSTANCE_NUMBER

INSTANCE_NUMBER specifies a unique number that maps the instance to one free list group for each database object created with storage parameter FREELIST GROUPS.

Property	Description
Parameter type	Integer
Default value	0 (zero)
Modifiable	No
Modifiable in a PDB	No
Range of values	1 to maximum number of instances specified when the database was created
Basic	Yes
Oracle RAC	You must set this parameter for every instance, and all instances must have different values.

INSTANCE_NUMBER is an Oracle RAC parameter that can be specified in parallel mode or exclusive mode.

The INSTANCE parameter of the ALTER TABLE ... ALLOCATE EXTENT statement assigns an extent to a particular free list group. If you set INSTANCE_NUMBER to the value specified for the INSTANCE parameter, the instance uses that extent for inserts and for updates that expand rows.

The practical maximum value of this parameter is the maximum number of instances specified in the CREATE DATABASE statement. The absolute maximum is operating system-dependent.

**See Also:**

Oracle Real Application Clusters Administration and Deployment Guide for more information

2.177 INSTANCE_TYPE

INSTANCE_TYPE specifies whether the instance is a database instance, an Oracle Automatic Storage Management (Oracle ASM) instance, or an Oracle ASM Proxy instance.

Property	Description
Parameter type	String
Syntax	INSTANCE_TYPE = { RDBMS ASM ASMPROXY }

Property	Description
Default value	RDBMS
Modifiable	No
Modifiable in a PDB	No
Basic	No
Oracle RAC	Multiple instances must have the same value.

Values

- RDBMS
The instance is a database instance.
- ASM
The instance is an Oracle ASM instance.
- ASMPROXY
The instance is an Oracle ASM proxy instance.

See Also:

Oracle Automatic Storage Management Administrator's Guide for information about managing Oracle Flex ASM

2.178 IORM_LIMIT_POLICY

IORM_LIMIT_POLICY specifies the policy for computing the Exadata I/O Resource Management (IORM) share and limit values for pluggable databases.

Property	Description
Parameter type	String
Syntax	IORM_LIMIT_POLICY = { RM_PLAN CPU_COUNT_RATIO }
Default value	RM_PLAN
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No
Oracle RAC	Multiple instances should use the same value.

Values:

- RM_PLAN
 - If a CDB resource plan is not specified by the user, that is, the CDB resource plan is set to DEFAULT_CDB_PLAN, then this setting gives equal IORM shares to all PDBs and specifies no utilization limits. If the CPU_MIN_COUNT initialization parameter is set, the IORM share values are determined by using the RAC-wide PDB value of

CPU_MIN_COUNT. Otherwise, the IORM share values for each PDB are determined using the RAC-wide PDB value of CPU_COUNT.

- If a user-defined CDB resource plan has been specified by setting the RESOURCE_MANAGER_PLAN initialization parameter, then the IORM share and utilization limit values for the PDBs are obtained from that resource plan.
- CPU_COUNT_RATIO
If the CPU_MIN_COUNT initialization parameter is set, the IORM share values are determined by using the RAC-wide PDB value of CPU_MIN_COUNT. Otherwise, the IORM share values for each PDB are determined using the RAC-wide PDB value of CPU_COUNT. In either case, IORM utilization limit values for each PDB are computed as a ratio of the RAC-wide PDB CPU_COUNT to the RAC-wide CDB CPU_COUNT.

The IORM utilization limit applies only to flash devices. It is not applicable for hard disks or XRMEM devices. The utilization limit is used for managing flash IOPS and throughput, and is not used to manage PDB flash cache space usage.

**Note:**

This parameter allows a third setting, CPU_COUNT_BASED. However, this setting is not supported.

**Note:**

This parameter is available starting with Oracle Database 23ai.

2.179 JAVA_JIT_ENABLED

JAVA_JIT_ENABLED enables or disables the Just-in-Time (JIT) compiler for the Oracle Java Virtual Machine (OracleJVM) environment.

Property	Description
Parameter type	Boolean
Default value	Operating system-dependent
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No

For platforms that support the JIT compiler, the default value of this parameter is `true`; otherwise the default value is `false`. Attempting to set this parameter to `true` on unsupported platforms will result in an error.

**See Also:**

Oracle Database Java Developer's Guide for more information about setting this parameter

2.180 JAVA_MAX_SESSIONSPACE_SIZE

`JAVA_MAX_SESSIONSPACE_SIZE` specifies (in bytes) the maximum amount of session space made available to a Java program executing in the server.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	No
Modifiable in a PDB	No
Range of values	0 to 2 GB - 1
Basic	No

Java session space is the memory that holds Java state from one database call to another. When a user's session-duration Java state attempts to exceed the amount specified by `JAVA_MAX_SESSIONSPACE_SIZE`, the Java virtual machine terminates the session with an out-of-memory failure.

**See Also:**

- *Oracle Database Java Developer's Guide* for more information about this parameter
- ["JAVA_SOFT_SESSIONSPACE_LIMIT"](#)

2.181 JAVA_POOL_SIZE

`JAVA_POOL_SIZE` specifies (in bytes) the size of the Java pool, from which the Java memory manager allocates most Java state during run-time execution. This memory includes the shared in-memory representation of Java method and class definitions, as well as the Java objects that are migrated to the Java session space at end-of-call.

Property	Description
Parameter type	Big integer
Syntax	<code>JAVA_POOL_SIZE = integer [K M G]</code>
Default value	If <code>SGA_TARGET</code> is set: If the parameter is not specified, then the default is 0 (internally determined by the Oracle Database). If the parameter is specified, then the user-specified value indicates a minimum value for the memory pool. If <code>SGA_TARGET</code> is not set: 24 MB, rounded up to the nearest granule size

Property	Description
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	Minimum: 0 (values greater than zero are rounded up to the nearest granule size) Maximum: operating system-dependent
Basic	No

**See Also:**

Oracle Database Java Developer's Guide for more information about this parameter

2.182 JAVA_SOFT_SESSIONSPACE_LIMIT

JAVA_SOFT_SESSIONSPACE_LIMIT specifies (in bytes) a **soft limit** on Java memory usage in a session, as a means to warn you if a user's session-duration Java state is using too much memory.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	No
Modifiable in a PDB	No
Range of values	0 to 2 GB - 1
Basic	No

Java session space is the memory that holds Java state from one database call to another. When a user's session-duration Java state exceeds the size specified by JAVA_SOFT_SESSIONSPACE_LIMIT, Oracle generates a warning that goes into the trace files.

**See Also:**

- *Oracle Database Java Developer's Guide* for more information on this parameter
- ["JAVA_MAX_SESSIONSPACE_SIZE"](#)

2.183 JOB_QUEUE_PROCESSES

JOB_QUEUE_PROCESSES specifies the maximum number of job workers per CDB or PDB that can be created for the execution of DBMS_JOB jobs and Oracle Scheduler (DBMS_SCHEDULER) jobs.

Property	Description
Parameter type	Integer
Default value	Derived. The lesser value of: • CPU_COUNT * 20 • SESSIONS / 4 If the result of the above derivation is less than twice the number of open containers in the CDB, then the value of this parameter is adjusted to equal twice the number of open containers in the CDB. Containers include CDB\$ROOT, PDB\$SEED, PDBs, application roots, application seeds, and application PDBs. You can obtain the number of open containers in a CDB with the following query: <pre>SELECT COUNT(*) FROM V\$CONTAINERS WHERE open_mode != 'MOUNTED';</pre>
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to 4000
Basic	No
Oracle RAC	Multiple instances can have different values.

DBMS_JOB and Oracle Scheduler share the same job coordinator and job workers, and they are both controlled by the JOB_QUEUE_PROCESSES parameter. The actual number of job workers created for Oracle Scheduler jobs is auto-tuned by the Scheduler depending on several factors, including available resources, Resource Manager settings, and currently running jobs. However, the combined total number of job workers running DBMS_JOB jobs and Oracle Scheduler jobs in a CDB or PDB can never exceed the value of JOB_QUEUE_PROCESSES for that CDB or PDB.

The default value for JOB_QUEUE_PROCESSES provides a compromise between quality of service for applications and reasonable use of system resources. However, it is possible that the default value does not suit every environment. In such cases, you can use the following guidelines to fine tune this parameter:

- In a CDB root:
Set JOB_QUEUE_PROCESSES to the maximum number of job workers that can be used simultaneously in the entire CDB. Oracle recommends that you set the value of this parameter to at least twice the number of open containers in the CDB, otherwise, there might be severe starvation between PDBs trying to run multiple jobs. If JOB_QUEUE_PROCESSES is set to 0 in a CDB root, then DBMS_JOB and Oracle Scheduler jobs cannot run in the CDB root or in any PDB, regardless of the JOB_QUEUE_PROCESSES setting at the PDB level.
- In a PDB:
Set JOB_QUEUE_PROCESSES to the maximum number of job workers that can be used simultaneously in the PDB. The actual number depends on the resources assigned by Resource Manager and the demand in other containers. When multiple PDBs request jobs, Oracle Scheduler attempts to give all PDBs a fair share of the processes. Oracle recommends that you set the value of this parameter to at least 2 in a PDB. However, if you do not want to run DBMS_JOB and Oracle Scheduler jobs in a PDB, then set JOB_QUEUE_PROCESSES to 0 in the PDB.

Materialized views and AutoTask use Oracle Scheduler for automatic refreshes. Setting `JOB_QUEUE_PROCESS` to 0 will disable these features and any other features that use Oracle Scheduler or `DBMS_JOB`.

**Note:**

`DBMS_JOB` is deprecated in Oracle Database 12c Release 2 (12.2.0.1) and may be removed in a future release. Oracle recommends that you use `DBMS_SCHEDULER` instead.

**See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for more information on the `DBMS_SCHEDULER` package
- *Oracle Database Data Warehousing Guide* for more information on managing materialized views
- *Oracle Database Advanced Queuing User's Guide* for more information about job queue processes
- *Oracle Database Administrator's Guide* for more information about the maximum number of scheduler job processes

2.184 JSON_BEHAVIOR

`JSON_BEHAVIOR` specifies the default `ON ERROR` behavior for certain SQL functions that operate on JSON data.

Property	Description
Parameter type	String
Syntax	<code>JSON_BEHAVIOR = { ON_ERROR:ERROR ON_ERROR:NULL }</code>
Default value	None
Modifiable	<code>ALTER SESSION</code>
Modifiable in a PDB	No
Basic	No

This parameter is set at the session level and helps you to ensure that JSON queries in a session are valid. This parameter is effective only for SQL functions for which `NULL ON ERROR` is the default behavior: `JSON_QUERY`, `JSON_TABLE` (without the `EXISTS` clause), and `JSON_VALUE`. These functions, by default, return a null value in the event of an error, which makes it difficult to identify invalid queries. Setting the `JSON_BEHAVIOR` parameter to `ON_ERROR:ERROR` for the session causes these functions to return an error for invalid queries.

Values:

- `ON_ERROR:ERROR` - Specifies that `ERROR ON ERROR` behavior is the session default for the affected SQL functions.

- `ON_ERROR:NULL` - Specifies that `NULL ON ERROR` behavior is the session default for the affected SQL functions. This setting is equivalent to having no setting for this parameter.

Example:

The following `JSON_VALUE` query is invalid, because the supplied JSON data contains more than one value for property `a`:

```
SELECT JSON_VALUE('[{a:1},{a:2}]', '$.a');
```

If the `JSON_BEHAVIOR` parameter is not set for the session, then `NULL ON ERROR` is the default behavior for the `JSON_VALUE` function. Therefore, the query returns null:

```
SQL> SHO PARAMETER JSON_BEHAVIOR
```

NAME	TYPE	VALUE
json_behavior	string	

```
SQL> SELECT JSON_VALUE('[{a:1},{a:2}]', '$.a');
```

```
JSON_VALUE('[{A:1},{A:2}]', '$.A')
-----
```

However, if you set the `JSON_BEHAVIOR` parameter to `ON_ERROR:ERROR` for the session, then the query returns an error:

```
SQL> ALTER SESSION SET JSON_BEHAVIOR = 'ON_ERROR:ERROR';
```

Session altered.

```
SQL> SHO PARAMETER JSON_BEHAVIOR
```

NAME	TYPE	VALUE
json_behavior	string	ON_ERROR:ERROR

```
SQL> SELECT JSON_VALUE('[{a:1},{a:2}]', '$.a');
SELECT JSON_VALUE('[{a:1},{a:2}]', '$.a')
*

```

ERROR at line 1:

ORA-40470: JSON query '\$.a' evaluated to multiple values.

**Note:**

This parameter is available starting with Oracle Database 23ai.

2.185 JSON_EXPRESSION_CHECK

Use `JSON_EXPRESSION_CHECK` to enable or disable JSON query statement checking.

Property	Description
Parameter type	String
Syntax	<code>JSON_EXPRESSION_CHECK = { ON OFF }</code>
Default value	OFF
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Different instances can use different values.

Set this parameter to `ON` to enable JSON query statement checking; set it to `OFF` to disable JSON query statement checking.

Note:

This parameter is available starting with Oracle Database 23ai.

See Also:

JSON-Relational Duality Developer's Guide for more information about `JSON_EXPRESSION_CHECK`

2.186 LARGE_POOL_SIZE

`LARGE_POOL_SIZE` specifies (in bytes) the size of the large pool allocation heap.

Property	Description
Parameter type	Big integer
Syntax	<code>LARGE_POOL_SIZE = integer [K M G]</code>
Default value	If <code>SGA_TARGET</code> is set, but a value is not specified for <code>LARGE_POOL_SIZE</code> , then the default is 0 (internally determined by the Oracle database). If <code>LARGE_POOL_SIZE</code> is specified, then the user-specified value indicates a minimum value for the memory pool. If <code>SGA_TARGET</code> is not set, then the default is 0.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	Minimum: the granule size Maximum: operating system-dependent

Property	Description
Basic	No

The large pool allocation heap is used in shared server systems for session memory, by parallel execution for message buffers, and by backup processes for disk I/O buffers. Parallel execution allocates buffers out of the large pool only when `SGA_TARGET` is set.

You can specify the value of this parameter using a number, optionally followed by K or M to specify kilobytes or megabytes, respectively. If you do not specify K or M, then the number is taken as bytes.

See Also:

Oracle Database Performance Tuning Guide for more information on setting this parameter

2.187 LDAP_DIRECTORY_ACCESS

`LDAP_DIRECTORY_ACCESS` specifies whether Oracle refers to Oracle Internet Directory for user authentication information.

Note:

Enterprise User Security (EUS) is deprecated with Oracle Database 23ai.

Oracle recommends that you migrate to using Centrally Managed Users (CMU). This feature enables you to directly connect with Microsoft Active Directory without an intervening directory service for enterprise user authentication and authorization to the database. If your Oracle Database is in the cloud, you can also choose to move to one of the newer integrations with a cloud identity provider.

Property	Description
Parameter type	String
Syntax	<code>LDAP_DIRECTORY_ACCESS = { NONE PASSWORD SSL }</code>
Default value	NONE
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No

If directory access is turned on, then this parameter also specifies how users are authenticated.

Values

- NONE

Oracle does not refer to Oracle Internet Directory for Enterprise User Security information.

- PASSWORD

Oracle tries to connect to the enterprise directory service using the database password stored in the database wallet. If that fails, then the Oracle Internet Directory connection fails and the database will not be able to retrieve enterprise roles and schema mappings upon enterprise user login.

- SSL

Oracle tries to connect to Oracle Internet Directory using SSL.

See Also:

Oracle Database Enterprise User Security Administrator's Guide for more information on Enterprise User Security

Using LDAP_DIRECTORY_ACCESS with PDBs

PDBs can use password or SSL authentication with Oracle Internet Directory for EUS, or Microsoft Active Directory for CMU, when the parameter value is set accordingly.

The LDAP_DIRECTORY_ACCESS initialization parameter is PDB-specific and can be set as follows:

- When you use the ALTER SYSTEM command to set the value of LDAP_DIRECTORY_ACCESS while connected to the CDB root:
 - If you specify the CONTAINER=ALL clause, then the setting applies to the CDB root and all PDBs.
 - If you omit the CONTAINER=ALL clause, or specify the CONTAINER=CURRENT clause, then the setting applies only to the CDB root.
- When you use the ALTER SYSTEM command to set the value of LDAP_DIRECTORY_ACCESS while connected to a PDB, the setting applies only to that PDB.
- When you set the value of LDAP_DIRECTORY_ACCESS in an initialization parameter file, the setting applies only to the CDB root; it does not apply to the PDBs.

For a CDB, if the wallet location is not specified in sqlnet.ora, then the default database wallet path is:

ORACLE_BASE/admin/db-unique-name/pdb-GUID/wallet (if ORACLE_BASE is set)

or:

ORACLE_HOME/admin/db-unique-name/pdb-GUID/wallet (if ORACLE_BASE is not set)

The exception is for the root database, which has a default wallet path of:

ORACLE_BASE/admin/db-unique-name/wallet (if ORACLE_BASE is set)

or:

ORACLE_HOME/admin/db-unique-name/wallet (if ORACLE_BASE is not set)

All PDBs in a CDB have the same database unique name. By placing wallets in the default location, each PDB can have its own identity.

Note that because there is only one `sqlnet.ora` file for a CDB, the wallet location in `sqlnet.ora` is only used by the CDB root container. Because each PDB must have its own wallet, a PDB wallet will be specified by the *pdb-GUID* under the wallet location in `sqlnet.ora`.

For the root container of a CDB, the wallet location is:

WALLET_LOCATION_specified_in_sqlnet.ora

For each PDB of the CDB, the wallet location is:

WALLET_LOCATION_specified_in_sqlnet.ora/pdb-GUID/

**Note:**

Oracle databases are registered with Oracle Internet Directory using Database Configuration Assistant (DBCA). For registration with Oracle Internet Directory to work, all the PDBs for a CDB must be registered using DBCA.

Using LDAP_DIRECTORY_ACCESS with Non-CDBs

For non-CDBs, if the wallet location is not specified in `sqlnet.ora`, then the default database wallet path is:

`ORACLE_BASE/admin/db-unique-name/wallet` (if `ORACLE_BASE` is set)

or:

`ORACLE_HOME/admin/db-unique-name/wallet` (if `ORACLE_BASE` is not set)

**See Also:**

Oracle Database Enterprise User Security Administrator's Guide for an example of setting the value of this parameter to `SSL` in the server parameter file using `ALTER SYSTEM`

2.188 LDAP_DIRECTORY_SYSAUTH

`LDAP_DIRECTORY_SYSAUTH` allows or disallows directory-based authorization for users granted administrative privileges, such as `SYSDBA`, `SYSOPER`, `SYSBACKUP`, `SYSDBG`, and `SYSKM`.

Property	Description
Parameter type	String
Syntax	<code>LDAP_DIRECTORY_SYSAUTH = { yes no }</code>
Default value	<code>no</code>
Modifiable	No
Modifiable in a PDB	Yes
Basic	Yes

When `LDAP_DIRECTORY_SYSAUTH` is set to `yes`, directory users are allowed to connect to the database as `SYSDBA`, `SYSOPER`, `SYSBACKUP`, `SYSDG`, or `SYSKM`, if they have mapped database global users that are granted corresponding administrative privileges such as `SYSDBA`, `SYSOPER`, `SYSBACKUP`, `SYSDG`, and `SYSKM`.

When `LDAP_DIRECTORY_SYSAUTH` is set to `no`, directory users are not allowed to connect to the database as `SYSDBA`, `SYSOPER`, `SYSBACKUP`, `SYSDG`, or `SYSKM`, even if they have mapped database global users that are granted corresponding administrative privileges such as `SYSDBA`, `SYSOPER`, `SYSBACKUP`, `SYSDG`, and `SYSKM`.

When modifying this parameter in a PDB, use the `ALTER SYSTEM` command with `SCOPE=SPFILE`.

2.189 LICENSE_MAX_SESSIONS

`LICENSE_MAX_SESSIONS` specifies the maximum number of concurrent user sessions allowed.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to number of session licenses
Basic	No
Oracle RAC	Multiple instances can have different values, but the total for all instances mounting a database should be less than or equal to the total number of sessions licensed for that database.

Note:

Oracle no longer offers licensing by the number of concurrent sessions. Therefore the `LICENSE_MAX_SESSIONS` and `LICENSE_SESSIONS_WARNING` initialization parameters have been deprecated.

When the limit specified by `LICENSE_MAX_SESSIONS` is reached, only users with the `RESTRICTED SESSION` privilege can connect to the database. Users who are not able to connect receive a warning message indicating that the system has reached maximum capacity.

A zero value indicates that concurrent usage (session) licensing is not enforced. If you set this parameter to a nonzero number, you might also want to set `LICENSE_SESSIONS_WARNING` (see "[LICENSE_SESSIONS_WARNING](#)").

Do not enable both concurrent usage licensing and user licensing. Set either `LICENSE_MAX_SESSIONS` or `LICENSE_MAX_USERS` to zero.

See Also:

Oracle Database Administrator's Guide for more information about this parameter

2.190 LICENSE_MAX_USERS

`LICENSE_MAX_USERS` specifies the maximum number of users you can create in the database.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to number of user licenses
Basic	No
Oracle RAC	Oracle recommends that multiple instances have the same value.

When you reach the limit specified by `LICENSE_MAX_USERS`, you cannot create more users. You can, however, increase the limit.

Note:

Oracle no longer offers licensing by the number of concurrent sessions. Therefore the `LICENSE_MAX_SESSIONS` and `LICENSE_SESSIONS_WARNING` initialization parameters have been deprecated.

See Also:

Oracle Database Administrator's Guide for more information about this parameter

2.191 LICENSE_SESSIONS_WARNING

`LICENSE_SESSIONS_WARNING` specifies a warning limit on the number of concurrent user sessions.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to value of <code>LICENSE_MAX_SESSIONS</code> parameter
Basic	No
Oracle RAC	Multiple instances can have different values.

**Note:**

Oracle no longer offers licensing by the number of concurrent sessions. Therefore the `LICENSE_MAX_SESSIONS` and `LICENSE_SESSIONS_WARNING` initialization parameters have been deprecated.

When this limit specified by `LICENSE_SESSIONS_WARNING` is reached, additional users can connect, but Oracle writes a message in the alert log for each new connection. Users with `RESTRICTED SESSION` privilege who connect after the limit is reached receive a warning message stating that the system is nearing its maximum capacity.

If this parameter is set to zero, no warning is given as you approach the concurrent usage (session) limit. If you set this parameter to a nonzero number, you should also set `LICENSE_MAX_SESSIONS` (see "[LICENSE_MAX_SESSIONS](#)").

**See Also:**

- *Oracle Database Administrator's Guide* for more information on setting this parameter

2.192 LISTENER_NETWORKS

`LISTENER_NETWORKS` specifies one or more sets of local, forward, and remote listeners for cross-registration. All listeners within the same *network_name* will cross-register.

Property	Description
Parameter type	String
Syntax	<code>LISTENER_NETWORKS =</code> <code>' ((NAME=<i>network_name</i>)</code> <code> (LOCAL_LISTENER=["]<i>listener_address</i>[,...] [")</code> <code> (FORWARD_LISTENER=["]<i>listener_address</i>[,...] [")</code> <code> [(REMOTE_LISTENER=["]<i>listener_address</i>[,...] [")])</code> <code>[,...]</code>
Default value	There is no default value.
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes
Basic	No

If a *network_name* is specified multiple times, then the resulting listener set is the union of each specification. This can be used to specify sets that require more than 255 characters, which is the per element limit.

The *listener_address* specifies a string that is an address, address list, or an alias that resolves to an address or address list of Oracle Net listeners. If an alias, the address or address list is specified in the `TNSNAMES.ORA` file or another address repository as configured for your system.

If a comma is used to specify a *listener_address* list, then the set of addresses must be surrounded by double quotes.

 See Also:

- "LOCAL_LISTENER"
- "FORWARD_LISTENER"
- "REMOTE_LISTENER"
- *Oracle Database Net Services Administrator's Guide* for more information on setting this parameter

2.193 LOB_SIGNATURE_ENABLE

LOB_SIGNATURE_ENABLE is used to enable or disable the LOB locator signature feature.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No
Oracle RAC	Multiple instances must have the same value.

You can secure your LOBs by enabling the LOB locator signature feature. A LOB locator is a pointer to the location of a large object (LOB) value. If the LOB_SIGNATURE_ENABLED initialization parameter is set to `true`, then when you create a LOB, Oracle Database automatically assigns a signature to the LOB locator. When Oracle Database receives a request from a client, it uses the signature to determine if any tampering with the LOB locator has occurred.

When this parameter is set to `true`, you also have the option of further securing your LOBs by encrypting your LOB locator signature keys.

 See Also:

Oracle Database Security Guide for more information on LOB locator signatures and encrypting LOB locator signature keys

2.194 LOCAL_LISTENER

LOCAL_LISTENER specifies a network name that resolves to an address or address list of Oracle Net local listeners (that is, listeners that run on the same system as this instance). The address or address list is specified in the TNSNAMES.ORA file or other address repository as configured for your system.

Property	Description
Parameter type	String
Syntax	<code>LOCAL_LISTENER = network_name</code>
Default value	<code>(ADDRESS = (PROTOCOL=TCP) (HOST=hostname) (PORT=1521))</code> where <i>hostname</i> is the network name of the local host.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No

 See Also:

- *Oracle Database Concepts* for more information about listener processes and dispatcher processes
- *Oracle Database Net Services Administrator's Guide* and your operating system-specific Oracle documentation for more information about specifying network addresses for the protocols on your system

2.195 LOCK_NAME_SPACE

LOCK_NAME_SPACE specifies the namespace that the distributed lock manager (DLM) uses to generate lock names.

Property	Description
Parameter type	String
Syntax	<code>LOCK_NAME_SPACE = namespace</code>
Default value	There is no default value.
Modifiable	No
Modifiable in a PDB	No
Range of values	Up to 8 alphanumeric characters. No special characters allowed.
Basic	No

 Note:

The LOCK_NAME_SPACE parameter is deprecated. It is retained for backward compatibility only.

Consider setting this parameter if a standby or clone database has the same database name on the same cluster as the primary database.

If the standby database resides on the same file system as the primary database, then set LOCK_NAME_SPACE in the standby parameter file to a distinct value such as the following:

```
LOCK_NAME_SPACE = standby
```

2.196 LOCK_SGA

LOCK_SGA locks the entire SGA into physical memory.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	No
Modifiable in a PDB	No
Range of values	true false
Basic	No

It is usually advisable to lock the SGA into real (physical) memory, especially if the use of virtual memory would include storing some of the SGA using disk space. This parameter is ignored on platforms that do not support it.

See Also:

Oracle Database Performance Tuning Guide for more information about using this parameter

2.197 LOG_ARCHIVE_CONFIG

LOG_ARCHIVE_CONFIG enables or disables the sending of redo logs to remote destinations and the receipt of remote redo logs, and specifies the unique database names (DB_UNIQUE_NAME) for each database in the Data Guard configuration.

Property	Description
Parameter type	String
Syntax	<pre>LOG_ARCHIVE_CONFIG = { [SEND NOSEND] [RECEIVE NORECEIVE] [DG_CONFIG=(remote_db_unique_name1 [, ... remote_db_unique_name30) NODG_CONFIG] }</pre>
Default value	NULL
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

Values

- SEND

- Enables the sending of redo logs to remote destinations
 - NOSEND
 - Disables the sending of redo logs to remote destinations
 - RECEIVE
 - Enables the receipt of remotely archived redo logs
 - NORECEIVE
 - Disables the receipt of remotely archived redo logs
 - DG_CONFIG
 - Specifies a list of up to 30 unique database names (defined with the `DB_UNIQUE_NAME` initialization parameter) for all of the databases in the Data Guard configuration.
 - NODG_CONFIG
 - Eliminates the list of service provider names previously specified with the `DG_CONFIG` option.

When this parameter has not been set, its default value is `NULL`. However, the `NULL` value is treated as if the parameter has been set to `'SEND, RECEIVE, NODG_CONFIG'`.

2.198 LOG_ARCHIVE_DEST

Use `LOG_ARCHIVE_DEST` to specify the destination to which redo log files will be archived.

Property	Description
Parameter type	String
Syntax	<code>LOG_ARCHIVE_DEST = filespec</code>
Default value	Null
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	No
Range of values	Any valid path or device name, except raw partitions
Basic	No
Oracle RAC	Multiple instances can have different values.

Note:

For Enterprise Edition users, this parameter has been deprecated in favor of the `LOG_ARCHIVE_DEST_n` parameters. If Oracle Enterprise Edition is not installed or it is installed, but you have not specified any `LOG_ARCHIVE_DEST_n` parameters, this parameter is valid.

`LOG_ARCHIVE_DEST` is applicable only if you are running the database in `ARCHIVELOG` mode or are recovering a database from archived redo logs. `LOG_ARCHIVE_DEST` is incompatible with the `LOG_ARCHIVE_DEST_n` parameters, and must be defined as the null string ("") or (' ') when any `LOG_ARCHIVE_DEST_n` parameter has a value other than a null string. Use a text string to specify the default location and root of the disk file or tape device when archiving redo log files.

(Archiving to tape is not supported on all operating systems.) The value cannot be a raw partition.

If LOG_ARCHIVE_DEST is not explicitly defined and all the LOG_ARCHIVE_DEST_n parameters have null string values, LOG_ARCHIVE_DEST is set to an operating system-specific default value on instance startup.

To override the destination that this parameter specifies, either specify a different destination for manual archiving or use the SQL*Plus statement `ARCHIVE LOG START filespec` for automatic archiving, where *filespec* is the new archive destination. To permanently change the destination, use the statement `ALTER SYSTEM SET LOG_ARCHIVE_DEST = filespec`, where *filespec* is the new archive destination.

Neither LOG_ARCHIVE_DEST nor LOG_ARCHIVE_FORMAT have to be complete file or directory specifiers themselves; they only need to form a valid file path after the variables are substituted into LOG_ARCHIVE_FORMAT and the two parameters are concatenated together.

See Also:

- *Oracle Database Backup and Recovery User's Guide*
- "LOG_ARCHIVE_DUPLEX_DEST", "LOG_ARCHIVE_MIN_SUCCEED_DEST", and "V\$ARCHIVE_DEST" for more information on setting this parameter
- Your Oracle operating system-specific documentation for the default value and for an example of how to specify the destination path or file name using LOG_ARCHIVE_DEST

2.199 LOG_ARCHIVE_DEST_n

The LOG_ARCHIVE_DEST_n initialization parameter defines up to 31 (where $n = 1, 2, 3, \dots 31$) destinations, each of which *must* specify either the LOCATION or the SERVICE attribute to specify where to archive the redo data.

Property	Description
Parameter type	String

Property	Description
Syntax	<pre>LOG_ARCHIVE_DEST_[1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31] = { null_string { LOCATION=path_name SERVICE=service_name } [MANDATORY] [REOPEN[=seconds]] [DELAY[=minutes]] [ENCRYPTION=ENABLED DISABLED] [GROUP=group] [NOREGISTER] [PRIORITY=priority] [TEMPLATE=template] [ALTERNATE=destination] [MAX_FAILURE=count] [SYNC ASYNC] [AFFIRM NOAFFIRM] [NET_TIMEOUT=seconds] [VALID_FOR=(redo_log_type,database_role)] [DB_UNIQUE_NAME] [COMPRESSION={ENABLE DISABLE ZLIB LZO}] }</pre>
Default value	There is no default value.
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	No
Basic	Yes

All other attributes except the `LOCATION` or `SERVICE` attributes are optional. Note that whether you are specifying the `LOCATION` attribute or the `SERVICE` attribute, it must be the first attribute supplied in the list of attributes.

If you choose not to enter any attributes, then you can specify a NULL string by entering the following:

```
LOG_ARCHIVE_DEST_n=' ';
```

You set the attributes for the `LOG_ARCHIVE_DEST_n` initialization parameter to control different aspects of how redo transport services transfer redo data from a production or primary database destination to another (standby) database destination. You can query the `V$ARCHIVE_DEST` view to see the current attribute settings for each destination (n).

Note:

Some of the attributes for this parameter are deprecated, but are being retained for backward compatibility. See "[Deprecated Attributes for LOG_ARCHIVE_DEST_n](#)".

For every `LOG_ARCHIVE_DEST_n` initialization parameter that you define, you must specify a corresponding `LOG_ARCHIVE_DEST_STATE_n` parameter. The `LOG_ARCHIVE_DEST_STATE_n` (where n is an integer from 1 to 31) initialization parameter specifies whether the corresponding destination is currently enabled or disabled.

**See Also:**

"LOG_ARCHIVE_DEST_STATE_1"

Destinations LOG_ARCHIVE_DEST_11 through LOG_ARCHIVE_DEST_31 do not support the SYNC, ARCH, LOCATION, MANDATORY, or ALTERNATE attributes, and cannot be specified as the target of the ALTERNATE attribute.

LOG_ARCHIVE_DEST_11 through LOG_ARCHIVE_DEST_31 can only be used when the COMPATIBLE initialization parameter is set to 11.2.0 or higher.

Values**See Also:**

Oracle Data Guard Concepts and Administration for detailed descriptions of all the values listed in this section

- AFFIRM and NOAFFIRM

Control whether a redo transport destination acknowledges received redo data before or after writing it to the standby redo log. The default is NOAFFIRM.

- ALTERNATE=LOG_ARCHIVE_DEST_1

Specifies an alternate archiving destination to be used when the original destination fails. There is no default value; if an alternate destination is not specified, then archiving does not automatically change to another destination if the original destination fails.

- ASYNC

The redo data generated by a transaction need not have been received at a destination which has this attribute before that transaction can commit. This is the default behavior if neither SYNC nor ASYNC is specified.

- COMPRESSION

Indicates whether network compression is enabled or disabled, or disabled, or whether the ZLIB or LZO algorithm is used. The possible values include:

- DISABLE: Compression is disabled.
- ENABLE: Compression is enabled. The ZLIB compression algorithm is used.
- ZLIB: ZLIB compression is used.
- LZO: LZO compression is used.

The Advanced Compression option is required in order to use the COMPRESSION attribute.

- DB_UNIQUE_NAME=*name*

Specifies a unique name for the database at this destination. You must specify a name; there is no default value.

- DELAY[=*minutes*]

Specifies a minimum time lag between when redo data is archived on a standby site retrieving redo from a primary and when the archived redo log file is applied to the standby database or any standbys cascading from it. If you specify the `DELAY` attribute without a time interval, the default is 30 minutes.

- `ENCRYPTION=DISABLE|ENABLE`

Controls whether encryption of the redo stream sent to Zero Data Loss Recovery Appliance (Recovery Appliance) is enabled or disabled. The default value for the attribute is `DISABLE`.

This attribute cannot be used with the `COMPRESSION`, `LOCATION`, or `SYNC` attributes.

To use the `ENCRYPTION` attribute, you must set the `COMPATIBLE` initialization parameter to 11.2.0.4 or higher on the protected database.

See Also:

Zero Data Loss Recovery Appliance Administrator's Guide for introductory information about Recovery Appliance

- `GROUP=group`

The `GROUP` attribute is used to specify membership in a specific collection of log archive destinations. Groups are numbered 1 through 8. The default group (`GROUP=0`) is special in that it cannot be assigned. The default group is populated with all destinations that are not explicitly assigned to a group. All groups other than the default group must consist of a set of remote destinations. No group (other than the default group) can contain local destinations.

- `LOCATION=local_disk_directory` or `USE_DB_RECOVERY_FILE_DEST`

Specifies either a local file system destination or the directory, file system, or Automatic Storage Management disk group that will serve as the fast recovery area. You must specify this attribute for at least one destination. You can specify either a local disk directory or fast recovery area with the `LOCATION` attribute. You *must* include either the `LOCATION` or the `SERVICE` attribute for each destination to specify where to archive the redo data.

- `MANDATORY`

Specifies that the transmission of redo data to the destination must succeed before the local online redo log file can be made available for reuse. If the `MANDATORY` attribute is not specified, then the destination is optional.

- `MAX_FAILURE`

Controls the consecutive number of times redo transport services attempt to reestablish communication and transmit redo data to a failed destination before the primary database gives up on the destination. See the `MAX_FAILURE` description in *Oracle Data Guard Concepts and Administration* for usage notes about how this attribute is handled differently in Oracle Database 12c Release 2 (12.2.0.1) and in Oracle Database 12c Release 1 (12.1.0.2).

- `NET_TIMEOUT=seconds`

Specifies the number of seconds the log writer process on the primary system waits for status from the `SYNC (NSSn)` process before terminating the network connection. The default is 30 seconds.

- `NOREGISTER`

Indicates that the location of the archived redo log file is not to be recorded at the corresponding destination.

- `PRIORITY=priority`

The `PRIORITY` attribute is used to specify preference within a group of log archive destinations. Priorities are numbered 1 through 8. A lower value represents a higher priority. The lowest priority (`PRIORITY=8`) is special in the sense that if that priority is active then all destinations at that priority will be made active. If any higher priority destination returns to service then that destination will be made active and all low priority destinations will be made inactive because they will be receiving redo from one of the other redo destinations, either through cascading or a Far Sync.

- `REOPEN[=seconds]`

Specifies the minimum number of seconds before the archiver processes (`ARCn`) or the log writer process (`LGWR`) should try again to access a previously failed destination. The default is 300 seconds.

- `SERVICE=net_service_name`

Specifies a valid Oracle Net service name (`SERVICE=net_service_name`) that identifies the remote Oracle database instance to which redo data will be sent. Each destination *must* specify either the `LOCATION` or the `SERVICE` attribute. There is no default net service name.

- `SYNC`

The redo data generated by a transaction must have been received by every enabled destination which has this attribute before that transaction can commit.

- `TEMPLATE=filename_template_%t_%s_%r`

Specifies a path name and a file name template for archived redo log files created at a redo transport destination that contain redo data from the database where this attribute is specified. This attribute overrides the value of the `LOG_ARCHIVE_FORMAT` initialization parameter at a redo transport destination. This attribute does not have a default value.

- `VALID_FOR=(redo_log_type, database_role)`

Identifies when redo transport services can transmit redo data to destinations based on the following factors:

- `redo_log_type`—whether online redo log files, standby redo log files, or both are *currently* being archived on the database at this destination
- `database_role`—whether the database is *currently* running in the primary or the standby role

Deprecated Attributes for LOG_ARCHIVE_DEST_n

The following attributes are deprecated for the `LOG_ARCHIVE_DEST_n` parameter. They are retained for backward compatibility only.

Table 2-3 Depreciated Attributes on the LOG_ARCHIVE_DEST_n Initialization Parameter

Deprecated Attribute	Alternative
ARCH	Specify <code>SYNC</code> or <code>ASYN</code> . <code>ASYN</code> is the default if neither attribute is specified.
LGWR	Specify <code>SYNC</code> or <code>ASYN</code> . <code>ASYN</code> is the default if neither attribute is specified.

Table 2-3 (Cont.) Deprecated Attributes on the LOG_ARCHIVE_DEST_n Initialization Parameter

Deprecated Attribute	Alternative
OPTIONAL	Destinations are optional by default.
VERIFY	None. This attribute is only used with the deprecated ARCH attribute.

In addition, note the following changes to the `ASYNCH` and `SYNCH` attributes:

- The `BLOCKS` keyword on the `ASYNCH` attribute is no longer needed.
It is no longer necessary to set this keyword because Data Guard dynamically adjusts the block count up or down to an appropriate number of blocks, as necessary.
- The `PARALLEL` and `NOPARALLEL` keywords on the `SYNCH` attribute are no longer needed.

2.200 LOG_ARCHIVE_DEST_STATE_n

The `LOG_ARCHIVE_DEST_STATE_n` parameters (where $n = 1, 2, 3, \dots, 31$) specify the availability state of the corresponding destination.

Property	Description
Parameter type	String
Syntax	<code>LOG_ARCHIVE_DEST_STATE_[1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31] = { enable defer alternate reset }</code>
Default value	enable
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	No
Basic	Yes

The parameter suffix (1 through 31) specifies one of the corresponding `LOG_ARCHIVE_DEST_n` destination parameters.

Values

- `enable`
Specifies that a valid log archive destination can be used for a subsequent archiving operation (automatic or manual). This is the default.
- `defer`
Specifies that valid destination information and attributes are preserved, but the destination is excluded from archiving operations until reenabled.
- `alternate`
Specifies that a log archive destination is not enabled but will become enabled if communications to another destination fail.
- `reset`

Functions the same as `defer`, but clears any error messages for the destination if it had previously failed.

The `LOG_ARCHIVE_DEST_STATE_n` parameters have no effect on the `ENABLE` state for the `LOG_ARCHIVE_DEST` or `LOG_ARCHIVE_DUPLEX_DEST` parameters.

The `V$ARCHIVE_DEST` dynamic performance view shows values in use for the current session. The `DEST_ID` column of that view corresponds to the archive destination suffix `n`.

See Also:

- *Oracle Data Guard Concepts and Administration* for more information about this parameter
- "`V$ARCHIVE_DEST`"

2.201 LOG_ARCHIVE_DUPLEX_DEST

`LOG_ARCHIVE_DUPLEX_DEST` is similar to the initialization parameter `LOG_ARCHIVE_DEST`. This parameter specifies a second archive destination: the **duplex** archive destination. This duplex archive destination can be either a must-succeed or a best-effort archive destination, depending on how many archive destinations must succeed (as specified in the `LOG_ARCHIVE_MIN_SUCCEED_DEST` parameter).

Property	Description
Parameter type	String
Syntax	<code>LOG_ARCHIVE_DUPLEX_DEST = filespec</code>
Default value	There is no default value.
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	No
Range of values	Either a null string or any valid path or device name, except raw partitions
Basic	No

Note:

If you are using Oracle Enterprise Edition, this parameter is deprecated in favor of the `LOG_ARCHIVE_DEST_n` parameters. If Oracle Enterprise Edition is not installed or it is installed but you have not specified any `LOG_ARCHIVE_DEST_n` parameters, this parameter is valid.

The default setting of a null string ("") or (' ') indicates that a duplex archive destination does not exist.

**See Also:**

- "LOG_ARCHIVE_DEST_*n*"
- "LOG_ARCHIVE_MIN_SUCCEED_DEST"
- "V\$ARCHIVE_DEST"
- *Oracle Database Administrator's Guide* for an example of using this parameter to specify an optional secondary archive destination

2.202 LOG_ARCHIVE_FORMAT

Use LOG_ARCHIVE_FORMAT to specify the default filename format when archiving redo log files.

Property	Description
Parameter type	String
Syntax	LOG_ARCHIVE_FORMAT = <i>filename</i>
Default value	Operating system-dependent
Modifiable	No
Modifiable in a PDB	No
Range of values	Any string that resolves to a valid filename
Basic	No
Oracle RAC	Multiple instances can have different values, but identical values are recommended.

LOG_ARCHIVE_FORMAT is applicable only if you are using the redo log in ARCHIVELOG mode. Use a text string and variables to specify the default filename format when archiving redo log files. The string generated from this format is appended to the string specified in the LOG_ARCHIVE_DEST parameter.

The following variables can be used in the format:

%s log sequence number

%S log sequence number, zero filled

%t thread number

%T thread number, zero filled

%a activation ID

%d database ID

%r resetlogs ID that ensures unique names are constructed for the archived log files across multiple incarnations of the database

Using uppercase letters for the variables (for example, %S) causes the value to be fixed length and padded to the left with zeros. An example of specifying the archive redo log filename format follows:

```
LOG_ARCHIVE_FORMAT = 'log%t_%s_%r.arc'
```

Archive log file names must contain each of the elements %s (sequence), %t (thread), and %r (resetlogs ID) to ensure that all archive log file names are unique. If the LOG_ARCHIVE_FORMAT initialization parameter is set in the parameter file, then make sure the parameter value contains the %s, %t, and %r elements. Otherwise, the following error is displayed at the time of instance startup:

```
ORA-19905: log_archive_format must contain %s, %t and %r
```

Neither LOG_ARCHIVE_DEST nor LOG_ARCHIVE_FORMAT have to be complete file or directory specifiers themselves; they only need to form a valid file path after the variables are substituted into LOG_ARCHIVE_FORMAT and the two parameters are concatenated together.

LOG_ARCHIVE_FORMAT is ignored in these cases:

- For archived log files that go to the fast recovery area
- When LOG_ARCHIVE_DEST[_n] points to the root of an Oracle ASM disk group (for example, +DATA). The directory of a disk group (for example, +DATA/logs) must be specified for the parameter to be honored.

In these cases where LOG_ARCHIVE_FORMAT is ignored, an Oracle ASM file name is used. See *Oracle Automatic Storage Management Administrator's Guide* for more information on Oracle ASM file names.

See Also:

- *Oracle Database Backup and Recovery User's Guide*, *Oracle Data Guard Concepts and Administration*, and *Oracle Real Application Clusters Administration and Deployment Guide* for more information about this parameter
- Your operating system- specific Oracle documentation for the default value and range of values for LOG_ARCHIVE_FORMAT

2.203 LOG_ARCHIVE_MAX_PROCESSES

LOG_ARCHIVE_MAX_PROCESSES specifies the maximum number of ARCn processes that can be created.

Property	Description
Parameter type	Integer
Default value	4
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	1 to 30
Basic	No

 See Also:

- ["Background Processes"](#) for more information about ARC*n* processes
- *Oracle Database Administrator's Guide* for more information about LOG_ARCHIVE_MAX_PROCESSES

2.204 LOG_ARCHIVE_MIN_SUCCEED_DEST

LOG_ARCHIVE_MIN_SUCCEED_DEST defines the minimum number of destinations that must succeed in order for the online logfile to be available for reuse.

Property	Description
Parameter type	Integer
Default value	1
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	1 to 10 if you are using LOG_ARCHIVE_DEST_ <i>n</i> 1 or 2 if you are using LOG_ARCHIVE_DEST and LOG_ARCHIVE_DUPLEX_DEST
Basic	No

If you are using the LOG_ARCHIVE_DEST_*n* parameters and automatic archiving is enabled, then the value of this parameter cannot exceed the number of enabled, valid destinations specified as MANDATORY plus the number of enabled, valid destinations that are configured with the OPTIONAL and LOCATION attributes.

If you are using LOG_ARCHIVE_DEST and LOG_ARCHIVE_DUPLEX_DEST and automatic archiving is enabled, a value of 1 specifies that the destination specified in LOG_ARCHIVE_DEST must succeed. A value of 2 specifies that the destinations specified in both parameters must succeed.

If the value of this parameter is less than the number of enabled, valid MANDATORY destinations, this parameter is ignored in favor of the MANDATORY destination count. If the value is more than the number of enabled, valid MANDATORY destinations, then some of the enabled, valid destinations configured with the OPTIONAL and LOCATION attributes are treated as MANDATORY.

You can switch dynamically from using the older parameters to the LOG_ARCHIVE_DEST_*n* parameter using ALTER SYSTEM, as follows:

1. Set LOG_ARCHIVE_MIN_SUCCEED_DEST to 1.
2. Set the value of LOG_ARCHIVE_DEST and LOG_ARCHIVE_DUPLEX_DEST to the null string.
3. Set the desired number of destinations for the LOG_ARCHIVE_DEST_*n* parameters.
4. Reset LOG_ARCHIVE_MIN_SUCCEED_DEST to the desired value.

 See Also:

- *Oracle Database Administrator's Guide* for more information on setting this parameter
- "LOG_ARCHIVE_DEST_#", "LOG_ARCHIVE_DUPLEX_DEST", and "V\$ARCHIVE_DEST" for information on related parameters

2.205 LOG_ARCHIVE_TRACE

LOG_ARCHIVE_TRACE enables and controls the generation of comprehensive trace information for log archiving and redo transport activity.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0, 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 16384, 32768
Basic	No
Oracle RAC	Multiple instances can have different values.

The additional tracing that is output when setting LOG_ARCHIVE_TRACE to a non-zero value can appear in trace files for an archive process, RFS process, LGWR process, SYNC process, ASYNC process, foreground process, MRP process, recovery process, log apply process, startup process, shutdown process, and other processes that use redo transport services.

Table 2-4 describes the valid LOG_ARCHIVE_TRACE values.

Table 2-4 LOG_ARCHIVE_TRACE Values

Value	Description	More Information
0	Disables archivelog tracing (this is the default)	
1	High-level tracing	High-level tracing provides a small amount of tracing from most redo transport processes. When a value is specified that is not high-level (not 1), the high-level tracing for that value will be output to the trace file even if the high-level tracing has not been specifically requested. For example, if you set LOG_ARCHIVE_TRACE to 128, you will get all the trace messages pertaining to the FAL engine, <i>including</i> the high-level tracing from the FAL engine.

Table 2-4 (Cont.) LOG_ARCHIVE_TRACE Values

Value	Description	More Information
2	Tracks Data Guard interfaces	This tracing level is for the various Data Guard configuration parameters, the various Data Guard related SQL commands, the various Data Guard table accesses, and some Data Guard internal interfaces.
4	Tracks common redo transport services	This tracing level is for a number of common services provided by redo transport to various internal users (such as the RFS process, the LGWR process, and the ASYNC process). These include locking primitives, use of common VOS (Virtual Operating System) interfaces, task scheduling, process monitoring, control file access, and other miscellaneous common services.
8	Tracks database protection mode	
16	Tracks disk and network I/O requests	
32	Tracks redo transport destinations	
64	Tracks redo transport archive engine	
128	Tracks redo transport FAL (fetch archive log) engine	
256	Tracks Physical, Logical, and Availability Machine clients of RFS process	
512	Tracks redo transport of LGWR, SYNC, and ASYNC processes	
1024	Tracks redo transport RFS process	
2048	Tracks redo transport gap resolution	
4096	Tracks real-time apply	
8192	Tracks recovery process	
16384	Tracks redo transport buffer management	
32768	Tracks LogMiner dictionary	

You can combine tracing levels by adding together the values of the desired tracing levels. For example, a setting of 3 will generate level 1 and level 2 trace output. You can set different values for the primary and standby database.

When this parameter is set to the default value of 0, Oracle will still generate appropriate alert and trace entries in response to error conditions. If you change the value of this parameter dynamically in an `ALTER SYSTEM` statement, the change takes effect immediately.

Many of the trace messages from redo transport processes include a routine name at the beginning of the trace message. The first part of the routine name specifies the module for that routine. [Table 2-5](#) shows the tracing value used for each redo transport module. Note that the tracing value for transport modules can change from release to release.

Table 2-5 Tracing Values Used for Redo Transport Modules

Module Name	Purpose	Tracing Value
krsa	Locking primitives	4
krsb	Buffer management	16384
krsc	Crash recovery	64
krsd	Destination	32
krse	Archive engine	64
krsf	FAL engine	128
krsg	Gap resolution	2048
krsh	Helper	4
krsi	Input/output	16
krsj	Protection mode	8
krsk	Control file access	4
krsl	Log writer	512
krsm	MRP process	8192
krsn	Configuration	2
krso	Process monitor	4
krsp	Physical standby and Availability Machine RFS client	256
krsq	SQL commands	2
krsr	RFS process	1024
krst	Tables	2
krsu	Network I/O	16
krsv	VOS front end	4
krsw	ASYNCR process	512
krsx	Internal interfaces	2

**See Also:***Oracle Database Administrator's Guide*

2.206 LOG_BUFFER

LOG_BUFFER specifies the amount of memory (in bytes) that Oracle uses when buffering redo entries to a redo log file.

Property	Description
Parameter type	Big integer
Default value	2 MB to 32 MB, depending on the SGA size and CPU count
Modifiable	No

Property	Description
Modifiable in a PDB	No
Range of values	2 MB to operating system-dependent
Basic	No

Redo log entries contain a record of the changes that have been made to the database block buffers. The LGWR process writes redo log entries from the log buffer to a redo log file.

The log buffer size depends on the number of redo strands in the system. One redo strand is allocated for every 16 CPUs and has a default size of 2 MB. Oracle allocates a minimum of 2 redo strands per instance. When the log buffer size is not specified, any remaining memory in the redo granules is given to the log buffer.

 See Also:

- Your operating system-specific Oracle documentation for the default value and range of values
- *Oracle Database Performance Tuning Guide* for information on resizing the redo log buffer using this parameter

2.207 LOG_CHECKPOINT_INTERVAL

LOG_CHECKPOINT_INTERVAL specifies the frequency of checkpoints in terms of the number of redo log file blocks that can exist between an incremental checkpoint and the last block written to the redo log. This number refers to physical operating system blocks, not database blocks.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to $2^{31} - 1$
Basic	No
Oracle RAC	Multiple instances can have different values.

Regardless of this value, a checkpoint always occurs when switching from one online redo log file to another. Therefore, if the value exceeds the actual redo log file size, checkpoints occur only when switching logs. Checkpoint frequency is one of the factors that influence the time required for the database to recover from an unexpected failure.

 Note:

- Specifying a value of 0 (zero) for `LOG_CHECKPOINT_INTERVAL` has the same effect as setting the parameter to infinity and causes the parameter to be ignored. Only nonzero values of this parameter are considered meaningful.
- Recovery I/O can also be limited by setting the `LOG_CHECKPOINT_TIMEOUT` parameter or by the size specified for the smallest redo log. For information on which mechanism is controlling checkpointing behavior, query the `V$INSTANCE_RECOVERY` view.

 See Also:

- ["LOG_CHECKPOINT_TIMEOUT"](#)
- ["V\\$INSTANCE_RECOVERY"](#)
- *Oracle Database Performance Tuning Guide* for information on disabling or removing this parameter when the `FAST_START_MTTR_TARGET` parameter is set

2.208 LOG_CHECKPOINT_TIMEOUT

`LOG_CHECKPOINT_TIMEOUT` specifies (in seconds) the amount of time that has passed since the incremental checkpoint at the position where the last write to the redo log (sometimes called the **tail of the log**) occurred. This parameter also signifies that no buffer will remain dirty (in the cache) for more than *integer* seconds.

Property	Description
Parameter type	Integer
Default value	1800
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	0 to $2^{31} - 1$
Basic	No
Oracle RAC	Multiple instances can have different values.

Specifying a value of 0 for the timeout disables time-based checkpoints. Hence, setting the value to 0 is not recommended unless `FAST_START_MTTR_TARGET` is set.

 Note:

- A checkpoint scheduled to occur because of this parameter is delayed until the completion of the previous checkpoint if the previous checkpoint has not yet completed.
- Recovery I/O can also be limited by setting the `LOG_CHECKPOINT_INTERVAL` parameter or by the size specified for the smallest redo log. For information on which mechanism is controlling checkpointing behavior, query the `V$INSTANCE_RECOVERY` view.

 See Also:

- `"LOG_CHECKPOINT_TIMEOUT"`
- `"V$INSTANCE_RECOVERY"`
- *Oracle Database Performance Tuning Guide* for information on disabling or removing this parameter when the `FAST_START_MTTR_TARGET` parameter is set

2.209 LOG_CHECKPOINTS_TO_ALERT

`LOG_CHECKPOINTS_TO_ALERT` lets you log your checkpoints to the alert log. Doing so is useful for determining whether checkpoints are occurring at the desired frequency.

Property	Description
Parameter type	Boolean
Default value	false
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	true false
Basic	No

2.210 LOG_FILE_NAME_CONVERT

`LOG_FILE_NAME_CONVERT` converts the filename of a new log file on the primary database to the filename of a log file on the standby database.

Property	Description
Parameter type	String

Property	Description
Syntax	<pre>LOG_FILE_NAME_CONVERT = 'string1' , 'string2' , 'string3' , 'string4' , ...</pre> Where: • <i>string1</i> is the pattern of the primary database filename • <i>string2</i> is the pattern of the standby database filename • <i>string3</i> is the pattern of the primary database filename • <i>string4</i> is the pattern of the standby database filename You can enclose each string in single or double quotation marks. You can specify as many pairs of primary and standby replacement strings as required. Example: <pre>LOG_FILE_NAME_CONVERT = '/dbs/t1/', '/dbs/t1/s', 'dbs/t2/', 'dbs/t2/s'</pre>
Default value	There is no default value.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Basic	No

If you add a log file to the primary database, you must add a corresponding file to the standby database.

Set the value of this parameter to one or more pairs of strings. The first string is the pattern found in the log file names on the primary database. The second string is the pattern found in the log file names on the standby database.

When the standby database is updated, this parameter converts the log file name on the primary database to the log file name on the standby database. The file must exist on the standby database and must be writable or the recovery process will halt with an error.

If you specify an odd number of strings (the last string has no corresponding replacement string), an error is signalled during startup. If the filename being converted matches more than one pattern in the pattern/replace string list, the first matched pattern takes effect. There is no limit on the number of pairs that you can specify in this parameter (other than the hard limit of the maximum length of multivalue parameters).

You should also use `LOG_FILE_NAME_CONVERT` to rename the logfiles in the clone control file when setting up the clone database during tablespace point-in-time recovery.

**Note:**

The `LOG_FILE_NAME_CONVERT` parameter applies only to online logs (not to archived logs).

**See Also:**

Oracle Data Guard Concepts and Administration

2.211 LONG_MODULE_ACTION

LONG_MODULE_ACTION enables the use of longer lengths for modules and actions.

Property	Description
Parameter type	Boolean
Default value	true
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	true false
Basic	No
Oracle RAC	The same value must be used on all instances.

Module length was 48 bytes and action length was 32 bytes in Oracle Database releases prior to Oracle Database 12c Release 2 (12.2.0.1).

Starting with Oracle Database 12c Release 2 (12.2.0.1):

- If LONG_MODULE_ACTION is set to TRUE (the default value), then the length of modules and actions will be 64 bytes each.
- If LONG_MODULE_ACTION is set to FALSE, then the length of modules will be 48 bytes, and the length of actions will be 32 bytes.

2.212 MANDATORY_USER_PROFILE

MANDATORY_USER_PROFILE specifies the mandatory user profile for a CDB or PDB.

Property	Description
Parameter type	String
Syntax	MANDATORY_USER_PROFILE = <i>profile_name</i>
Default value	There is no default value
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Multiple instances must use the same value.

For *profile_name*, specify the name of a mandatory user profile. Mandatory user profiles are common profiles created in the CDB root with the following SQL statement:

```
CREATE MANDATORY PROFILE ... CONTAINER = ALL;
```

You can set the value of MANDATORY_USER_PROFILE in the CDB root or in a PDB.

- When you set this parameter in the CDB root, the specified mandatory user profile applies to the CDB root and all PDBs.

- When you set this parameter in a PDB, the specified mandatory user profile applies only to that PDB and overrides the mandatory user profile for the CDB root, if any.

Only common users with the commonly granted `ALTER SYSTEM` privilege or the commonly granted `SYSDBA` privilege can set the value of `MANDATORY_USER_PROFILE` in the CDB root or in a PDB. This prevents local PDB administrators from circumventing any restrictions that are enforced at the CDB root.

**See Also:**

See *Oracle Database Security Guide* for more information about mandatory user profiles

2.213 MAX_AUTH_SERVERS

`MAX_AUTH_SERVERS` specifies the maximum number of authentication servers in the authentication pool. This pool authenticates user connections when client applications connect to Database Resident Connection Pooling (DRCP).

Property	Description
Parameter type	Integer
Default value	25
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	Yes, according to the following guidelines: • When the <code>ENABLE_PER_PDB_DRCP</code> initialization parameter is set to <code>true</code>, <code>MAX_AUTH_SERVERS</code> can be modified only at the PDB level; it cannot be modified for the CDB root. • When the <code>ENABLE_PER_PDB_DRCP</code> initialization parameter is set to <code>false</code>, <code>MAX_AUTH_SERVERS</code> can be modified only for the CDB root; it cannot be modified at the PDB level.
Range of values	Minimum: <code>MIN_AUTH_SERVERS</code> or 1, whichever is the greater value Maximum: operating system-dependent
Basic	No
Oracle RAC	Different instances can use different values.

The value of this parameter must be greater than or equal to the value of the `MIN_AUTH_SERVERS` initialization parameter, which specifies the minimum number of authentication servers in the authentication pool. The exception is when `MIN_AUTH_SERVERS` = 0. In this case, the value of `MAX_AUTH_SERVERS` must be greater than or equal to 1.

**See Also:**

- *Oracle Database Administrator's Guide* for more information about setting this parameter
- `"ENABLE_PER_PDB_DRCP"`
- `"MIN_AUTH_SERVERS"`

2.214 MAX_COLUMNS

Use `MAX_COLUMNS` to enable or disable Wide Tables for the database.

Property	Description
Parameter type	String
Syntax	<code>MAX_COLUMNS = { STANDARD EXTENDED }</code>
Default value	STANDARD
Modifiable	No
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Multiple instances must use the same value.

Values:

- To enable Wide Tables, set this parameter to `EXTENDED`. With this setting, the maximum number of columns allowed in a database table or view is 4096.

The `COMPATIBLE` initialization parameter must be set to `23.0.0.0` or higher in order to set `MAX_COLUMNS = EXTENDED`.
- To disable Wide Tables, set this parameter to `STANDARD`. With this setting, the maximum number of columns allowed in a database table or view is 1000. This matches the behavior in releases prior to Oracle Database 23ai.

You can change the value of `MAX_COLUMNS` from `STANDARD` to `EXTENDED` at any time. However, you can change the value of `MAX_COLUMNS` from `EXTENDED` to `STANDARD` only when all tables and views in the database contain 1000 or fewer columns.

Note:

The increased column limit of 4096 is supported by Oracle Database 23ai clients, such as SQL*Plus, OCI, JDBC-OCI, unmanaged ODP.NET, and open source drivers. Older client versions (pre-Oracle Database 23ai) do not support the increased column limit and cannot access more than 1000 columns in a table or view.

Note:

This parameter is available starting with Oracle Database 23ai.

2.215 MAX_DATAPUMP_JOBS_PER_PDB

MAX_DATAPUMP_JOBS_PER_PDB determines the maximum number of concurrent Oracle Data Pump jobs per PDB.

Property	Description
Parameter type	String
Syntax	MAX_DATAPUMP_JOBS_PER_PDB = { AUTO integer }
Default value	AUTO
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to 250 or AUTO
Basic	No
Oracle RAC	The same value must be used on all instances.

When this parameter has a value of `AUTO`, Oracle Data Pump will derive its actual value to be 50% of the `SESSIONS` initialization parameter.

A value that is too large could cause Oracle Data Pump to consume too many system resources, while a value that is too small could prevent users from performing their Oracle Data Pump tasks.

The main resource Oracle Data Pump uses is shared pool in the System Global Area (SGA) for the database. Parallel jobs increase the number of sessions and, depending on the job, the number of PX servers used.

See Also:

- *Oracle Database Utilities* for more information about using Oracle Data Pump with CDBs
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_DATAPUMP` PL/SQL package

2.216 MAX_DATAPUMP_PARALLEL_PER_JOB

MAX_DATAPUMP_PARALLEL_PER_JOB specifies the maximum number of parallel processes allowed per Oracle Data Pump job.

Property	Description
Parameter type	String
Syntax	MAX_DATAPUMP_PARALLEL_PER_JOB = { integer AUTO }
Default value	AUTO
Range of values	1 to 1024, or AUTO
Modifiable	ALTER SYSTEM

Property	Description
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Different instances can use different values.

When this parameter has a value of `AUTO`, Oracle Data Pump derives its value to be 50 percent of the value of the `SESSIONS` initialization parameter.

2.217 MAX_DISPATCHERS

`MAX_DISPATCHERS` specifies the maximum number of dispatcher processes allowed to be running simultaneously.

Property	Description
Parameter type	Integer
Default value	There is no default value.
Modifiable	<code>ALTER SYSTEM</code>
Modifiable in a PDB	No
Range of values	If <code>MAX_DISPATCHERS</code> is specified, then it should be greater than or equal to the number of dispatchers specified by the <code>DISPATCHERS</code> parameter and less than the number of processes specified by the <code>PROCESSES</code> parameter.
Basic	No

This parameter can be overridden by the `DISPATCHERS` parameter and is maintained for backward compatibility with older releases.

See Also:

- *Oracle Database Administrator's Guide* for more information about this parameter
- Your operating system-specific Oracle documentation for the default value and range of values

2.218 MAX_DUMP_FILE_SIZE

`MAX_DUMP_FILE_SIZE` specifies the maximum size of trace files (excluding the alert log).

Property	Description
Parameter type	String
Syntax	<code>MAX_DUMP_FILE_SIZE = { integer [K M G] UNLIMITED }</code>

Property	Description
Default value	Oracle Database Free: 32M (4 segments of 8 MB each) For all other Oracle Database offerings, the default value is 1G, which means: • The maximum size for trace files generated by foreground processes is 1 GB (5 segments of 200 MB each). • The maximum size for other trace files, such as incident trace files and trace files generated by background processes, is 10 GB (5 segments of 2 GB each).
Modifiable	ALTER SESSION, ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to unlimited, or UNLIMITED
Basic	No

You can change this limit if you are concerned that trace files may use too much space.

- A numeric value for `MAX_DUMP_FILE_SIZE` specifies the maximum size in operating system blocks.
- A numeric value followed by a `K` or `M` or `G` suffix specifies the file size in kilobytes, megabytes, or gigabytes.
- The special value string `UNLIMITED` means that there is no upper limit on trace file size. Thus, dump files can be as large as the operating system permits.

When the trace file is limited in size, it may be automatically split into multiple files, called segments, if needed. This process is called trace file segmentation. The segments will have the same file name as the active trace file, but with an extra segment number appended.

The trace file can be split into a maximum of 5 segments, and the size of each segment will typically be 1/5th of the trace file limit.

When the combined size of all the trace file segments exceeds the specified limit, the oldest segment is deleted, and a new, empty segment is created. Thus, the trace file always contains the most recent trace information. The first segment is never deleted, because it may contain relevant information about the initial state of the process, unless it ages out and gets purged. Rotation will happen between the remaining segments only.

Note that trace file segmentation will not occur when this parameter is set to a value less than 25 MB.

See Also:

Oracle Database Administrator's Guide and *Oracle Database SQL Tuning Guide* for more information on setting this parameter

2.219 MAX_IDLE_BLOCKER_TIME

MAX_IDLE_BLOCKER_TIME specifies the maximum number of minutes that a blocking session can be idle. After that point, the session is automatically terminated.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to the maximum integer. The value of 0 indicates that there is no limit.
Basic	No
Oracle RAC	Different instances can use different values.

A session is considered to be a blocking session when it is holding resources required by other sessions. For example:

- The session is holding a lock required by another session.
- The session is a parallel operation and its consumer group, PDB, or database has either reached its maximum parallel server limit or has queued parallel operations.
- The session's PDB or database instance is about to reach its SESSIONS or PROCESSES limit.

This parameter differs from the MAX_IDLE_TIME parameter in that MAX_IDLE_TIME applies to all sessions (blocking and non-blocking), whereas MAX_IDLE_BLOCKING_TIME applies only to blocking sessions. Therefore, in order for MAX_IDLE_BLOCKING_TIME to be effective, its limit must be less than the MAX_IDLE_TIME limit.

Note:

This parameter does not have an effect on parallel query processes, nor on SYS user sessions.

See Also:

"MAX_IDLE_TIME"

2.220 MAX_IDLE_TIME

MAX_IDLE_TIME specifies the maximum number of minutes that a session can be idle. After that point, the session is automatically terminated.

Property	Description
Parameter type	Integer

Property	Description
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to the maximum integer. The value of 0 indicates that there is no limit.
Basic	No
Oracle RAC	Different instances can use different values.

See Also:

"[MAX_IDLE_BLOCKER_TIME](#)" to learn how to set a lower idle time limit for sessions that are holding resources required by other sessions

2.221 MAX_IOPS

MAX_IOPS enables you to set the maximum number of I/Os that can be issued per second on a per pluggable database (PDB) basis. This parameter is used to throttle PDB I/Os.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to the maximum Integer value. A very low value (for example, under 100 I/Os per second) is not recommended.
Basic	No
Oracle RAC	Different values can be set on different instances.

DBWR I/Os, control file I/Os, password file I/Os and other critical I/Os are exempted from the rate limit set by this parameter, but their I/Os are accounted for while throttling. Because of these exemptions, the PDB's actual I/O rate may sometimes exceed the limit.

This feature is enabled for multitenant container database (CDB) only. The feature is not supported on Oracle Exadata.

This parameter can be set from inside a PDB. If the parameter is set in CDB\$ROOT, all the PDBs in that CDB will inherit the parameter value from CDB\$ROOT. This parameter cannot be set in a non-CDB environment.

The default value of 0 means that no limits are set on the maximum number of I/Os that can be issued per second in a PDB.

If Oracle processes need to wait because of this IO rate limit, the wait event is resmgr: I/O rate limit.

**See Also:**

- "MAX_MBPS"
- "resmgr: I/O rate limit"

Examples

This example shows how to use SQL statements to set a maximum of 3000 I/Os per second on a PDB named CDB1_PDB1:

```
alter session set container = cdb1_pdb1;  
alter system set max_iops = 3000;
```

2.222 MAX_MBPS

MAX_MBPS enables you to set the maximum number of megabytes (MB) of I/Os issued per second on a per pluggable database (PDB) basis. This parameter is used to throttle PDB I/Os.

Property	Description
Parameter type	Integer
Default value	0
Modifiable	ALTER SYSTEM
Modifiable in a PDB	Yes
Range of values	0 to the maximum Integer value. A very low value (for example, under 25 MB per second) is not recommended.
Basic	No
Oracle RAC	Different values can be set on different instances.

DBWR I/Os, control file I/Os, password file I/Os and other critical I/Os are exempted from the throughput limit set by this parameter, but their I/Os are accounted for while throttling. Because of these exemptions, the PDB's actual I/O rate may sometimes exceed the limit.

This feature is enabled for multitenant container database (CDB) only. The feature is not supported on Oracle Exadata.

This parameter can be set from inside a PDB. If the parameter is set in CDB\$ROOT, all the PDBs in that CDB will inherit the parameter value from CDB\$ROOT. This parameter cannot be set in a non-CDB environment.

The default value of 0 means that no limits are set on the maximum number of megabytes (MB) of I/Os that can be issued per second in a PDB.

If Oracle processes need to wait because of this IO rate limit, the wait event is resmgr: I/O rate limit.

 See Also:

- "MAX_IOPS"
- "resmgr: I/O rate limit"

Examples

This example shows how to use SQL statements to set a maximum of 200 megabytes per second on a PDB named CDB1_PDB1:

```
alter session set container = cdb1_pdb1;  
alter system set max_mbps = 200;
```

2.223 MAX_PDBS

MAX_PDBS allows you to limit the number of pluggable databases (PDBs) that can be created in a CDB or an application container.

Property	Description
Parameter type	Integer
Default value	Depends on the Oracle Database edition Possible values: 5, 254, or 4098
Modifiable	ALTER SYSTEM ... SID='*'
Modifiable in a PDB	No. However, this parameter can be modified in the application root of an application container.
Range of values	Minimum: 0 Maximum: The default value for the Oracle Database edition (5, 254, or 4098)
Basic	No
Oracle RAC	The same value must be used on all instances.

This parameter can only be set while connected to the CDB root or an application root.

This parameter applies to PDBs, application containers, and application PDBs. An application PDB is a PDB that resides in an application container.

This parameter does not apply to the PDB seed (PDB\$SEED), application seeds, or application root clones.

 Note:

The maximum number of PDBs that you are allowed to create in a CDB depends on the licensing policy for your Oracle Database edition. To learn more, refer to the Oracle Multitenant information in the "Consolidation" table in *Oracle Database Licensing Information User Manual*.

2.224 MAX_SAGA_DURATION

MAX_SAGA_DURATION specifies the maximum duration for a saga (in seconds).

If a saga exists for longer than the amount of time specified by this parameter, it is considered incomplete and is eligible for termination.

Property	Description
Parameter type	Integer
Default value	86400 seconds (equivalent to 24 hours)
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	1 to $2^{31} - 1$
Basic	No
Oracle RAC	Multiple instances must have the same value.

Note:

This parameter is available starting with Oracle Database 23ai.

2.225 MAX_SHARED_SERVERS

MAX_SHARED_SERVERS specifies the maximum number of shared server processes allowed to be running simultaneously. Setting this parameter enables you to reserve process slots for other processes, such as dedicated servers.

Property	Description
Parameter type	Integer
Default value	There is no default value.
Modifiable	ALTER SYSTEM
Modifiable in a PDB	No
Range of values	If MAX_SHARED_SERVERS is specified, then it should be greater than or equal to SHARED_SERVERS and less than PROCESSES.
Basic	No

When you want to reduce the range of shared servers, you can reduce MAX_SHARED_SERVERS before reducing SHARED_SERVERS. If MAX_SHARED_SERVERS is lower than SHARED_SERVERS, then the number of shared servers will not vary but will remain at the constant level specified by SHARED_SERVERS. If MAX_SHARED_SERVERS is not specified, then a shared server process may be spawned as long as the number of free process slots is greater than 1 / 8 the maximum number of processes, or 2 if PROCESSES is less than 24.

**See Also:**

- "SHARED_SERVERS"
- "PROCESSES"
- *Oracle Database Administrator's Guide* for more information on setting this parameter
- *Oracle Database Concepts* for information on processes
- Your operating system-specific Oracle documentation for the default value and range of values

2.226 MAX_STRING_SIZE

MAX_STRING_SIZE controls the maximum size of VARCHAR2, NVARCHAR2, and RAW data types in SQL.

Property	Description
Parameter type	String
Syntax	MAX_STRING_SIZE = { STANDARD EXTENDED }
Default value	STANDARD
Modifiable	ALTER SYSTEM ... SID=* ¹
Modifiable in a PDB	Yes
Basic	No
Oracle RAC	Multiple instances must use the same value.

¹ Use ALTER SYSTEM only when the database is in UPGRADE mode, and run the utl32k.sql script afterward, as explained in this section.

STANDARD means that the length limits for Oracle Database releases prior to Oracle Database 12c apply (for example, 4000 bytes for VARCHAR2 and NVARCHAR2, and 2000 bytes for RAW).

EXTENDED means that the 32767 byte limit introduced in Oracle Database 12c applies.

The COMPATIBLE initialization parameter must be set to 12.0.0.0 or higher to set MAX_STRING_SIZE = EXTENDED.

You can change the value of MAX_STRING_SIZE from STANDARD to EXTENDED. However, you cannot change the value of MAX_STRING_SIZE from EXTENDED to STANDARD.

By setting MAX_STRING_SIZE = EXTENDED, users are taking an explicit action that could introduce application incompatibility in their database. Applications that do not want to use the expanded data types can be rewritten for compatibility with either setting; for example, these applications could use explicit CASTs to fix the length of VARCHAR2 expressions during CREATE TABLE AS SELECT.

Altering MAX_STRING_SIZE will update database objects and possibly invalidate them, as follows:

- Tables with virtual columns will be updated with new data type metadata for virtual columns of VARCHAR2 (4000), 4000-byte NVARCHAR2, or RAW (2000) type.
 - Functional indexes will become unusable if a change to their associated virtual columns causes the index key to exceed index key length limits. Attempts to rebuild such indexes will fail with ORA-01450: maximum key length exceeded.
- Views will be invalidated if they contain VARCHAR2 (4000), 4000-byte NVARCHAR2, or RAW (2000) typed expression columns.
- Materialized views will be updated with new metadata VARCHAR2 (4000), 4000-byte NVARCHAR2, and RAW (2000) typed expression columns

Increasing the Maximum Size of VARCHAR2, NVARCHAR2, and RAW Columns in a CDB

To increase the maximum size of VARCHAR2, NVARCHAR2, and RAW columns in a CDB and in all the PDBs in the CDB:

1. Connect to the CDB AS SYSDBA.
2. In the root, change the setting of MAX_STRING_SIZE to EXTENDED:

```
ALTER SESSION SET CONTAINER=CDB$ROOT;
ALTER SYSTEM SET max_string_size=extended SCOPE=SPFILE;
```

Note:

The root continues to use STANDARD semantics even after MAX_STRING_SIZE is set to EXTENDED. The reason for setting MAX_STRING_SIZE to EXTENDED in the root is so all the PDBs in the CDB can inherit the EXTENDED setting from the root.

3. Shut down the CDB.
 4. Restart the CDB in UPGRADE mode.
- ```
startup upgrade;
```
5. Use the catcon.pl script to run the rdbms/admin/utl32k.sql script in the root and in all the PDBs in the CDB to increase the maximum size of the VARCHAR2, NVARCHAR2, and RAW columns. The --force\_pdb\_mode 'UPGRADE' option is used to ensure that all PDBs, including application root clones, are opened in migrate mode. Enter the SYS password when prompted:

```
$ cd $ORACLE_HOME/rdbms/admin
$ mkdir /scratch/mydir/utl32k_cdb_pdb_output
$ $ORACLE_HOME/perl/bin/perl $ORACLE_HOME/rdbms/admin/catcon.pl -u SYS --
force_pdb_mode 'UPGRADE' -d $ORACLE_HOME/rdbms/admin -l '/scratch/mydir/
utl32k_cdb_pdb_output' -b
utl32k_cdb_pdb_output utl32k.sql
catcon: ALL catcon-related output will be written to [/scratch/mydir/
utl32k_cdb_pdb_output/utl32k_cdb_pdb_output_catcon_23172.lst]
catcon: See [/scratch/mydir/utl32k_cdb_pdb_output/
utl32k_cdb_pdb_output*.log] files for output generated by scripts
catcon: See [/scratch/mydir/utl32k_cdb_pdb_output/
utl32k_cdb_pdb_output_*.lst] files for spool files, if any
Enter Password:
```

```
catcon.pl: completed successfully
$
```

### Note:

The `utl32k.sql` script increases the maximum size of the `VARCHAR2`, `NVARCHAR2`, and `RAW` columns for the views where this is required. The script does not increase the maximum size of the `VARCHAR2`, `NVARCHAR2`, and `RAW` columns in some views because of the way the SQL for those views is written.

6. Connect to the CDB AS SYSDBA and shut down the database.
7. Restart the CDB in NORMAL mode.

```
startup;
```

8. Use the `catcon.pl` script to run the `rdbms/admin/utlrlp.sql` script to recompile invalid objects in the root and in all the PDBs in the CDB. The `--force_pdb_mode 'READ WRITE'` option is used to ensure that all the PDBs (including application root clones) are opened in read write mode. Enter the SYS password when prompted:

```
$ cd $ORACLE_HOME/rdbms/admin
$ mkdir /scratch/mydir/utlrlp_cdb_pdb_output
$ $ORACLE_HOME/perl/bin/perl $ORACLE_HOME/rdbms/admin/catcon.pl -u SYS --
force_pdb_mode 'READ WRITE' -d $ORACLE_HOME/rdbms/admin -l '/scratch/mydir/
utlrlp_cdb_pdb_output' -b utlrlp_cdb_pdb_output utlrlp.sql
catcon: ALL catcon-related output will be written to [/scratch/mydir/
utlrlp_cdb_pdb_output/utlrlp_cdb_pdb_output_catcon_24271.lst]
catcon: See [/scratch/mydir/utlrlp_cdb_pdb_output/
utlrlp_cdb_pdb_output*.log] files for output generated by scripts
catcon: See [/scratch/mydir/utlrlp_cdb_pdb_output/
utlrlp_cdb_pdb_output_*.lst] files for spool files, if any
Enter Password:
catcon.pl: completed successfully
$
```

## Increasing the Maximum Size of VARCHAR2, NVARCHAR2, and RAW Columns in a PDB

To increase the maximum size of `VARCHAR2`, `NVARCHAR2`, and `RAW` columns in a PDB:

1. Shut down the PDB.
2. Reopen the PDB in migrate mode.

 **Note:**

The following SQL statement can be used to reopen a PDB in migrate mode when the current container is the PDB:

```
ALTER PLUGGABLE DATABASE pdb-name OPEN UPGRADE;
```

3. Change the setting of `MAX_STRING_SIZE` in the PDB to `EXTENDED`.
4. Run the `rdbms/admin/utl32k.sql` script in the PDB. You must be connected `AS SYSDBA` to run the `utl32k.sql` script.
5. Reopen the PDB in `NORMAL` mode.

 **Note:**

The `utl32k.sql` script increases the maximum size of the `VARCHAR2`, `NVARCHAR2`, and `RAW` columns for the views where this is required. The script does not increase the maximum size of the `VARCHAR2`, `NVARCHAR2`, and `RAW` columns in some views because of the way the SQL for those views is written.

6. Run the `rdbms/admin/utlrp.sql` script in the PDB to recompile invalid objects. You must be connected `AS SYSDBA` to run the script.

 **See Also:**

*Oracle Multitenant Administrator's Guide* for more information about modifying the open mode of PDBs.

### Increasing the Maximum Size of `VARCHAR2`, `NVARCHAR2`, and `RAW` Columns in an Oracle RAC Database

To increase the maximum size of `VARCHAR2`, `NVARCHAR2`, and `RAW` columns in an Oracle RAC database:

1. Shut down all of the Oracle RAC database instances, except one.
2. Restart the Oracle RAC database instance in `UPGRADE` mode.
3. Change the setting of `MAX_STRING_SIZE` to `EXTENDED`.
4. Run the `rdbms/admin/utl32k.sql` script in the Oracle RAC database instance. You must be connected `AS SYSDBA` to run the script.
5. Restart all Oracle RAC database instances in `NORMAL` mode.

 **Note:**

The `utl32k.sql` script increases the maximum size of the `VARCHAR2`, `NVARCHAR2`, and `RAW` columns for the views where this is required. The script does not increase the maximum size of the `VARCHAR2`, `NVARCHAR2`, and `RAW` columns in some views because of the way the SQL for those views is written.

6. Run the `rdbms/admin/utl32k.sql` script to recompile invalid objects. You must be connected `AS SYSDBA` to run the script.

### Increasing the Maximum Size of `VARCHAR2`, `NVARCHAR2`, and `RAW` Columns in an Oracle Data Guard Logical Standby Database

To increase the maximum size of `VARCHAR2`, `NVARCHAR2`, and `RAW` columns in an Oracle Data Guard logical standby database:

1. Shut down the Oracle Data Guard primary database and logical standby database.
2. Restart the primary database and logical standby database in `UPGRADE` mode.
3. Change the setting of `MAX_STRING_SIZE` to `EXTENDED` on the primary database and logical standby database.
4. Run the `rdbms/admin/utl32k.sql` script on both the primary database and the logical standby database. You must be connected `AS SYSDBA` to run the script.
5. Restart the primary database and logical standby database in `NORMAL` mode.

 **Note:**

The `utl32k.sql` script increases the maximum size of the `VARCHAR2`, `NVARCHAR2`, and `RAW` columns for the views where this is required. The script does not increase the maximum size of the `VARCHAR2`, `NVARCHAR2`, and `RAW` columns in some views because of the way the SQL for those views is written.

6. Run the `rdbms/admin/utl32k.sql` script on the primary database and logical standby database to recompile invalid objects. You must be connected `AS SYSDBA` to run the script.
7. Restart SQL Apply.

## 2.227 MEMOPTIMIZE\_POOL\_SIZE

`MEMOPTIMIZE_POOL_SIZE` sets the size of the memoptimize pool, a memory area in the system global area (SGA) used by the Memoptimized Rowstore.

| Property                   | Description                                              |
|----------------------------|----------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                              |
| <b>Syntax</b>              | <code>MEMOPTIMIZE_POOL_SIZE = integer [K   M   G]</code> |
| <b>Default value</b>       | 0                                                        |
| <b>Modifiable</b>          | No                                                       |
| <b>Modifiable in a PDB</b> | No                                                       |
| <b>Range of values</b>     | 0 to no maximum                                          |
| <b>Basic</b>               | No                                                       |
| <b>Oracle RAC</b>          | Different values can be used on different instances.     |

The Memoptimized Rowstore improves the data query performance of applications, such as Internet of Things (IoT), that frequently query tables based on primary key values.

The Memoptimized Rowstore provides the capability of fast lookup of data for the tables that are mainly queried based on primary key columns.

This parameter specifies an integer value to indicate the amount of SGA to use for allocating the following structures for the memoptimize pool:

- The size of the buffer cache region: This is the total number of blocks for all `MEMOPTIMIZE FOR READ` tables.
- The size of the hash index segmented data structure pointing to the special blocks of `MEMOPTIMIZE FOR READ` tables.

Calculate the buffer cache requirement for the table being considered for `MEMOPTIMIZE FOR READ`, and include an additional 25% memory requirement for the hash index segmented data structure.

These structures are allocated from SGA at instance startup.

The value specified for this parameter counts toward `SGA_TARGET`. For example, if you set `SGA_TARGET` to 10 GB and you set `MEMOPTIMIZE_POOL_SIZE` to 2 GB, then 20% of the `SGA_TARGET` setting is allocated to the memoptimize pool.

Unlike other SGA components such as the buffer cache and shared pool, the memoptimize pool size is not controlled by automatic memory management. The database does not automatically shrink the memoptimize pool when the buffer cache or shared pool requires more memory, or increase the memoptimize pool when it runs out of space. You can only increase the size of the memoptimize pool by manually adjusting the `MEMOPTIMIZE_POOL_SIZE` initialization parameter.

### See Also:

*Oracle Database Performance Tuning Guide* for more information about the Memoptimized Rowstore and the memoptimize pool.

## 2.228 MEMOPTIMIZE\_WRITE\_AREA\_SIZE

`MEMOPTIMIZE_WRITE_AREA_SIZE` specifies the size of the ingest buffer in the large pool of the SGA. The ingest buffer is where Memoptimized Rowstore fast ingest inserts are buffered.

| Property                   | Description                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                                                      |
| <b>Syntax</b>              | <code>MEMOPTIMIZE_WRITE_AREA_SIZE = integer [K   M   G]</code>                                   |
| <b>Default value</b>       | 0                                                                                                |
| <b>Modifiable</b>          | <code>ALTER SYSTEM ... SID='*'</code>                                                            |
| <b>Modifiable in a PDB</b> | No                                                                                               |
| <b>Range of values</b>     | 0 to operating system-dependent                                                                  |
| <b>Basic</b>               | No                                                                                               |
| <b>Oracle RAC</b>          | You must set this parameter for every instance, and multiple instances must have the same value. |

### Note:

This parameter is available starting with Oracle Database 23ai.

## 2.229 MEMOPTIMIZE\_WRITES

`MEMOPTIMIZE_WRITES` allows you to instruct the database to always use fast ingest when inserting data into tables enabled for Memoptimized Rowstore fast ingest.

| Property                   | Description                                     |
|----------------------------|-------------------------------------------------|
| <b>Parameter type</b>      | String                                          |
| <b>Syntax</b>              | <code>MEMOPTIMIZE_WRITES = { HINT   ON }</code> |
| <b>Default value</b>       | HINT                                            |
| <b>Modifiable</b>          | <code>ALTER SESSION</code>                      |
| <b>Modifiable in a PDB</b> | No                                              |
| <b>Basic</b>               | No                                              |

The fast ingest feature of Memoptimized Rowstore was introduced in Oracle Database 19c. At that time, the only way to direct the database to use fast ingest was to specify the `MEMOPTIMIZE_WRITE` hint in the `INSERT` statement.

Starting with Oracle Database 23ai, you can also direct the database to use fast ingest by setting the `MEMOPTIMIZE_WRITES` initialization parameter as follows:

- **ON** - When inserting data into tables enabled for fast ingest, the fast ingest feature is always used, regardless of whether the `MEMOPTIMIZE_WRITE` hint is specified in the `INSERT` statement.

- **HINT** - When inserting data into tables enabled for fast ingest, the fast ingest feature is used only when the `MEMOPTIMIZE_WRITE` hint is specified in the `INSERT` statement.

**Note:**

This parameter is available starting with Oracle Database 23ai.

## 2.230 MEMORY\_MAX\_SIZE

`MEMORY_MAX_SIZE` specifies the maximum value to which a DBA can set the `MEMORY_SIZE` initialization parameter.

| Property                   | Description                                                                           |
|----------------------------|---------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                                           |
| <b>Syntax</b>              | <code>MEMORY_MAX_SIZE = integer [K   M   G]</code>                                    |
| <b>Default value</b>       | The value of the <code>MEMORY_SIZE</code> initialization parameter                    |
| <b>Modifiable</b>          | No                                                                                    |
| <b>Modifiable in a PDB</b> | No                                                                                    |
| <b>Range of values</b>     | <code>MEMORY_SIZE</code> to the physical memory size available to the Oracle database |
| <b>Basic</b>               | No                                                                                    |
| <b>Oracle RAC</b>          | Different instances can use different values.                                         |

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

"[MEMORY\\_SIZE](#)" for more information about how the settings of `MEMORY_MAX_SIZE` and `MEMORY_SIZE` affect each other

## 2.231 MEMORY\_MAX\_TARGET

`MEMORY_MAX_TARGET` specifies the maximum value to which a DBA can set the `MEMORY_TARGET` initialization parameter.

| Property              | Description                                          |
|-----------------------|------------------------------------------------------|
| <b>Parameter type</b> | Big integer                                          |
| <b>Syntax</b>         | <code>MEMORY_MAX_TARGET = integer [K   M   G]</code> |
| <b>Default value</b>  | 0                                                    |

| Property                   | Description                                                    |
|----------------------------|----------------------------------------------------------------|
| <b>Modifiable</b>          | No                                                             |
| <b>Modifiable in a PDB</b> | No                                                             |
| <b>Range of values</b>     | 0 to the physical memory size available to the Oracle Database |
| <b>Basic</b>               | No                                                             |

See the description of `MEMORY_TARGET` for more information about how the settings of `MEMORY_MAX_TARGET` and `MEMORY_TARGET` affect each other.

#### See Also:

*Oracle Database Administrator's Guide* for more information about managing memory

## 2.232 MEMORY\_SIZE

`MEMORY_SIZE` specifies the size of instance-wide usable memory.

| Property                   | Description                                                                                                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                                                                                                                                                            |
| <b>Syntax</b>              | <code>MEMORY_SIZE = integer [K   M   G]</code>                                                                                                                                                         |
| <b>Default value</b>       | 0                                                                                                                                                                                                      |
| <b>Modifiable</b>          | You can use <code>ALTER SYSTEM</code> to increase or decrease the value of this parameter. However, the value of this parameter must always be greater than or equal to its value at instance startup. |
| <b>Modifiable in a PDB</b> | No                                                                                                                                                                                                     |
| <b>Range of values</b>     | 1536 MB to <code>MEMORY_MAX_SIZE</code>                                                                                                                                                                |
| <b>Basic</b>               | No                                                                                                                                                                                                     |
| <b>Oracle RAC</b>          | Different instances can use different values.                                                                                                                                                          |

In a text-based initialization parameter file, if you omit `MEMORY_MAX_SIZE` and include a value for `MEMORY_SIZE`, then the database automatically sets `MEMORY_MAX_SIZE` to the value of `MEMORY_SIZE`. If you omit the line for `MEMORY_SIZE` and include a value for `MEMORY_MAX_SIZE`, the `MEMORY_SIZE` parameter defaults to 0. After instance startup, you can dynamically change `MEMORY_SIZE` to a nonzero value, provided that it does not exceed the value of `MEMORY_MAX_SIZE`.

Based on the value of `MEMORY_SIZE`, the values for the SGA and PGA parameters `SGA_TARGET` and `PGA_AGGREGATE_LIMIT` will be calculated internally for the instance. The sizing will also depend on the large page settings.

When `MEMORY_SIZE` is set to a nonzero value, the CDB-level values for the following SGA and PGA parameters will be ignored by the database: `SGA_MAX_SIZE`, `PGA_AGGREGATE_LIMIT`, and `SGA_TARGET`. If you assign a value to any of these parameters at the time of instance startup, the database will not report an error, but the parameter value will be ignored. If you dynamically modify any of these parameters, an error will be reported.

When `MEMORY_SIZE` is set to a nonzero value, the `MEMORY_MAX_TARGET` and `MEMORY_TARGET` parameters should be set to 0. If you attempt to set either of these parameters to a nonzero value, the request will be ignored, and a warning will be written to the alert log at startup.

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

"`MEMORY_MAX_SIZE`"

## 2.233 MEMORY\_TARGET

`MEMORY_TARGET` specifies the Oracle system-wide usable memory.

The database tunes memory to the `MEMORY_TARGET` value, reducing or enlarging the SGA and PGA as needed.

| Property                   | Description                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                                                                              |
| <b>Syntax</b>              | <code>MEMORY_TARGET = integer [K   M   G]</code>                                                                         |
| <b>Default value</b>       | 0 (SGA autotuning is disabled for DEFERRED mode autotuning requests, but allowed for IMMEDIATE mode autotuning requests) |
| <b>Modifiable</b>          | ALTER SYSTEM                                                                                                             |
| <b>Modifiable in a PDB</b> | No                                                                                                                       |
| <b>Range of values</b>     | 152 MB to <code>MEMORY_MAX_TARGET</code>                                                                                 |
| <b>Basic</b>               | No                                                                                                                       |

`MEMORY_TARGET` should be set higher than or equal to the sum of the current sizes of the SGA and PGA.

In a text-based initialization parameter file, if you omit `MEMORY_MAX_TARGET` and include a value for `MEMORY_TARGET`, then the database automatically sets `MEMORY_MAX_TARGET` to the value of `MEMORY_TARGET`. If you omit the line for `MEMORY_TARGET` and include a value for `MEMORY_MAX_TARGET`, the `MEMORY_TARGET` parameter defaults to zero. After startup, you can then dynamically change `MEMORY_TARGET` to a nonzero value, provided that it does not exceed the value of `MEMORY_MAX_TARGET`.

Total memory usage can grow beyond the value of `MEMORY_TARGET`. For example, memory is allocated to PL/SQL tables and varrays regardless of the value of `MEMORY_TARGET` as long as memory is available at the operating system level.

In the **Default value** field, IMMEDIATE mode autotuning requests are necessary to avoid ORA-04031 errors. The DEFERRED and IMMEDIATE modes are reflected in the `OPER_MODE` column of the `V$MEMORY_RESIZE_OPS` view.

**Note:**

The default value of `SGA_MAX_SIZE` depends on the values of `MEMORY_TARGET` and `MEMORY_MAX_TARGET`.

- *Oracle Multitenant Administrator's Guide* for information about the initialization parameters that control the memory usage of PDBs

## 2.234 MIN\_AUTH\_SERVERS

`MIN_AUTH_SERVERS` specifies the minimum number of authentication servers in the authentication pool. This pool authenticates user connections when client applications connect to Database Resident Connection Pooling (DRCP).

| Property            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | Integer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Default value       | If the <code>ENABLE_PER_PDB_DRCP</code> initialization parameter is set to <code>true</code> , then the default value for <code>MIN_AUTH_SERVERS</code> is 0 in each PDB.<br><br>If the <code>ENABLE_PER_PDB_DRCP</code> initialization parameter is set to <code>false</code> , then the default value for <code>MIN_AUTH_SERVERS</code> is 1 in the CDB root.                                                                                                                                                                    |
| Modifiable          | ALTER SYSTEM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Modifiable in a PDB | Yes, according to the following guidelines: <ul style="list-style-type: none"><li>• When the <code>ENABLE_PER_PDB_DRCP</code> initialization parameter is set to <code>true</code>, <code>MIN_AUTH_SERVERS</code> can be modified only at the PDB level; it cannot be modified for the CDB root.</li><li>• When the <code>ENABLE_PER_PDB_DRCP</code> initialization parameter is set to <code>false</code>, <code>MIN_AUTH_SERVERS</code> can be modified only for the CDB root; it cannot be modified at the PDB level.</li></ul> |
| Range of values     | Minimum: 0<br><br>Maximum: <code>MAX_AUTH_SERVERS</code> or <code>PROCESSES</code> , whichever is the lesser value                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Basic               | No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Oracle RAC          | Different instances can use different values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The value of this parameter must be less than or equal to the values of both the `MAX_AUTH_SERVERS` initialization parameter and the `PROCESSES` initialization parameter. The `MAX_AUTH_SERVERS` parameter specifies the maximum number of authentication servers in the authentication pool. The `PROCESSES` parameter specifies the maximum number of operating system user processes that can simultaneously connect to Oracle.

 **See Also:**

- *Oracle Database Administrator's Guide* for more information about setting this parameter
- ["ENABLE\\_PER\\_PDB\\_DRCP"](#)
- ["MAX\\_AUTH\\_SERVERS"](#)
- ["PROCESSES"](#)

## 2.235 MLE\_PROG\_LANGUAGES

Use `MLE_PROG_LANGUAGES` to enable or disable Oracle Database Multilingual Engine (MLE) completely, or selectively enable certain languages.

| Property                   | Description                                                  |
|----------------------------|--------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                       |
| <b>Syntax</b>              | <code>MLE_PROG_LANGUAGES = { ALL   JAVASCRIPT   OFF }</code> |
| <b>Default value</b>       | ALL                                                          |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                  |
| <b>Modifiable in a PDB</b> | Yes                                                          |
| <b>Basic</b>               | No                                                           |
| <b>Oracle RAC</b>          | Multiple instances must have the same value.                 |

**Values:**

- `ALL` - Enable MLE completely.
- `JAVASCRIPT` - Enable MLE for JavaScript only. Note that MLE currently supports JavaScript as its sole language. Therefore, the `JAVASCRIPT` setting has the same effect as the `ALL` setting.
- `OFF` - Disable MLE completely.

If MLE is disabled completely at the CDB level, it cannot be enabled at the PDB or session level. Similarly, if MLE is disabled completely at the PDB level, it cannot be enabled at the session level.

 **Note:**

This parameter is available starting with Oracle Database 23ai.

 **See Also:**

*Oracle Database Multilingual Engine JavaScript Developer's Guide* for more information about this parameter

## 2.236 MULTISHARD\_QUERY\_DATA\_CONSISTENCY

`MULTISHARD_QUERY_DATA_CONSISTENCY` enables you to specify a data consistency setting for multi-shard queries.

| Property                   | Description                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                              |
| <b>Syntax</b>              | <code>MULTISHARD_QUERY_DATA_CONSISTENCY = { STRONG   SHARD_LOCAL   DELAYED_STANDBY_ALLOWED }</code> |
| <b>Default value</b>       | STRONG                                                                                              |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                                                         |
| <b>Modifiable in a PDB</b> | Yes                                                                                                 |
| <b>Basic</b>               | No                                                                                                  |
| <b>Oracle RAC</b>          | The value of this parameter can be different on different Oracle RAC instances.                     |

You can use `MULTISHARD_QUERY_DATA_CONSISTENCY` to avoid the cost of SCN synchronization when executing multi-shard queries across shards, which can be globally distributed.

`MULTISHARD_QUERY_DATA_CONSISTENCY` can be set at the system level or the session level.

The values that can be set for `MULTISHARD_QUERY_DATA_CONSISTENCY` are:

- **STRONG:** With this setting, SCN synchronization is performed across all shards, and data is consistent across all shards. This setting provides global consistent read capability. This is the default value.
- **SHARD\_LOCAL:** With this setting, SCN synchronization is not performed across all shards. Data is consistent within each shard. This setting provides the most current data.
- **DELAYED\_STANDBY\_ALLOWED:** With this setting, SCN synchronization is not performed across all shards. Data is consistent within each shard. This setting allows data to be fetched from Data Guard standby databases when possible (for example, depending on load balancing), and may return stale data from standby databases.

### See Also:

*Oracle Globally Distributed Database Guide* for more information about specifying consistency levels in a multi-shard query

## 2.237 NLS\_CALENDAR

`NLS_CALENDAR` specifies which calendar system Oracle uses.

| Property              | Description                                   |
|-----------------------|-----------------------------------------------|
| <b>Parameter type</b> | String                                        |
| <b>Syntax</b>         | <code>NLS_CALENDAR = "calendar_system"</code> |

| Property                   | Description                    |
|----------------------------|--------------------------------|
| <b>Default value</b>       | None, implies GREGORIAN        |
| <b>Modifiable</b>          | ALTER SESSION                  |
| <b>Modifiable in a PDB</b> | Yes                            |
| <b>Range of values</b>     | Any valid calendar format name |
| <b>Basic</b>               | No                             |

NLS\_CALENDAR can have one of the following values:

- Arabic Hijrah
- English Hijrah
- Ethiopian
- Gregorian
- Japanese Imperial
- Persian
- ROC Official (Republic of China)
- Thai Buddha

For example, suppose NLS\_CALENDAR is set to "Japanese Imperial", the date format is "E YY-MM-DD". ("E" is the date format element for the abbreviated era name.) If the date is May 15, 1997, then the SYSDATE is displayed as follows:

```
SELECT SYSDATE FROM DUAL;
SYSDATE

H 09-05-15
```

**Note:**

The value of the initialization parameter NLS\_CALENDER is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. If the initialization parameter is not specified, the initial session value becomes GREGORIAN. This initial value is overridden by a client-side value if the client is OCI-based and the NLS\_LANG client setting (environment variable) is defined.

**See Also:**

*Oracle Database Globalization Support Guide* for a listing of available calendar systems

## 2.238 NLS\_COMP

NLS\_COMP specifies the collation behavior of the database session.

| Property            | Description                               |
|---------------------|-------------------------------------------|
| Parameter type      | String                                    |
| Syntax              | NLS_COMP = { BINARY   LINGUISTIC   ANSI } |
| Default value       | BINARY                                    |
| Modifiable          | ALTER SESSION                             |
| Modifiable in a PDB | Yes                                       |
| Basic               | No                                        |

### Values

- **BINARY**  
Normally, comparisons in the `WHERE` clause and in PL/SQL blocks is binary unless you specify the `NLSSORT` function.
- **LINGUISTIC**  
Comparisons for all SQL operations in the `WHERE` clause and in PL/SQL blocks should use the linguistic sort specified in the `NLS_SORT` parameter. To improve the performance, you can also define a linguistic index on the column for which you want linguistic comparisons.
- **ANSI**  
A setting of `ANSI` is for backward compatibility; in general, you should set `NLS_COMP` to `LINGUISTIC`.

#### Note:

Unless you explicitly set the value for `NLS_COMP` in your initialization parameter file, a default value of `NULL` is shown in the following views: `V$PARAMETER`, `V$SYSTEM_PARAMETER`, `V$PARAMETER2`, `V$SYSTEM_PARAMETER2`, and `NLS_INSTANCE_PARAMETERS`. However, the actual default value, and behavior, is `BINARY`. Note that you cannot change the default to `NULL`, because `NULL` is not among the valid values.

### Examples

See *Oracle Database Globalization Support Guide* for examples of using this parameter.

#### Note:

The value of this initialization parameter `NLS_COMP` is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the `NLS_LANG` client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

## 2.239 NLS\_CURRENCY

NLS\_CURRENCY specifies the string to use as the local currency symbol for the L number format element. The default value of this parameter is determined by NLS\_TERRITORY.

| Property            | Description                                                                 |
|---------------------|-----------------------------------------------------------------------------|
| Parameter type      | String                                                                      |
| Syntax              | NLS_CURRENCY = <i>currency_symbol</i>                                       |
| Default value       | Derived from NLS_TERRITORY                                                  |
| Modifiable          | ALTER SESSION                                                               |
| Modifiable in a PDB | Yes                                                                         |
| Range of values     | Any valid character string, with a maximum of 10 bytes (not including null) |
| Basic               | No                                                                          |

### Note:

The value of this initialization parameter NLS\_CURRENCY is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the NLS\_LANG client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

## 2.240 NLS\_DATE\_FORMAT

NLS\_DATE\_FORMAT specifies the default date format to use with the TO\_CHAR and TO\_DATE functions. The default value of this parameter is determined by NLS\_TERRITORY.

| Property            | Description                         |
|---------------------|-------------------------------------|
| Parameter type      | String                              |
| Syntax              | NLS_DATE_FORMAT = " <i>format</i> " |
| Default value       | Derived from NLS_TERRITORY          |
| Modifiable          | ALTER SESSION                       |
| Modifiable in a PDB | Yes                                 |

| Property        | Description                                                 |
|-----------------|-------------------------------------------------------------|
| Range of values | Any valid date format mask but not exceeding a fixed length |
| Basic           | No                                                          |

The value of this parameter can be any valid date format mask, and the value must be surrounded by double quotation marks. For example:

```
NLS_DATE_FORMAT = "MM/DD/YYYY"
```

 **Note:**

The value of this initialization parameter `NLS_DATE_FORMAT` is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the `NLS_LANG` client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

 **See Also:**

*Oracle Database Globalization Support Guide* for more information about this parameter

## 2.241 NLS\_DATE\_LANGUAGE

`NLS_DATE_LANGUAGE` specifies the language to use for the spelling of day and month names and date abbreviations (a.m., p.m., AD, BC) returned by the `TO_DATE` and `TO_CHAR` functions.

| Property            | Description                               |
|---------------------|-------------------------------------------|
| Parameter type      | String                                    |
| Syntax              | <code>NLS_DATE_LANGUAGE = language</code> |
| Default value       | Derived from <code>NLS_LANGUAGE</code>    |
| Modifiable          | <code>ALTER SESSION</code>                |
| Modifiable in a PDB | Yes                                       |
| Range of values     | Any valid <code>NLS_LANGUAGE</code> value |
| Basic               | No                                        |

**Note:**

The value of this initialization parameter `NLS_DATE_LANGUAGE` is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the `NLS_LANG` client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

**See Also:**

- *Oracle Database Globalization Support Guide* for more information about this parameter
- *Oracle Database SQL Language Reference* for information on the `TO_DATE` function.
- *Oracle Database SQL Language Reference* for information on the `TO_CHAR` function.

## 2.242 NLS\_DUAL\_CURRENCY

`NLS_DUAL_CURRENCY` specifies the dual currency symbol (such as "Euro") for the territory. The default is the dual currency symbol defined in the territory of your current language environment.

| Property            | Description                                      |
|---------------------|--------------------------------------------------|
| Parameter type      | String                                           |
| Syntax              | <code>NLS_DUAL_CURRENCY = currency_symbol</code> |
| Default value       | Derived from <code>NLS_TERRITORY</code>          |
| Modifiable          | <code>ALTER SESSION</code>                       |
| Modifiable in a PDB | Yes                                              |
| Range of values     | Any valid format name up to 10 characters        |
| Basic               | No                                               |

**Note:**

The value of this initialization parameter `NLS_DUAL_CURRENCY` is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the `NLS_LANG` client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

**See Also:**

*Oracle Database Globalization Support Guide* for more information about this parameter

## 2.243 NLS\_ISO\_CURRENCY

NLS\_ISO\_CURRENCY determines the string to use as the international currency symbol corresponding to the C number format element in a call to the TO\_CHAR function.

| Property            | Description                         |
|---------------------|-------------------------------------|
| Parameter type      | String                              |
| Syntax              | NLS_ISO_CURRENCY = <i>territory</i> |
| Default value       | Derived from NLS_TERRITORY          |
| Modifiable          | ALTER SESSION                       |
| Modifiable in a PDB | Yes                                 |
| Range of values     | Any valid NLS_TERRITORY value       |
| Basic               | No                                  |

Local currency symbols can be ambiguous. For example, a dollar sign (\$) can refer to U.S. dollars or Australian dollars. ISO Specification 4217 defines unique "international" currency symbols for the currencies of specific territories or countries. The value of the NLS\_ISO\_CURRENCY parameter is the Oracle name of the territory whose ISO currency symbol is returned in place of the C number format element. For example, if NLS\_ISO\_CURRENCY is set to AMERICA, the string 'USD' is returned by TO\_CHAR where the C element is specified in the format.

**Note:**

The value of this initialization parameter NLS\_ISO\_CURRENCY is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the NLS\_LANG client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

**See Also:**

- *Oracle Database Globalization Support Guide* for more information about this parameter
- *Oracle Database SQL Language Reference* for information on number format elements

## 2.244 NLS\_LANGUAGE

NLS\_LANGUAGE specifies the default language of the database.

| Property            | Description                                                                |
|---------------------|----------------------------------------------------------------------------|
| Parameter type      | String                                                                     |
| Syntax              | NLS_LANGUAGE = <i>language</i>                                             |
| Default value       | Operating system-dependent, derived from the NLS_LANG environment variable |
| Modifiable          | ALTER SESSION                                                              |
| Modifiable in a PDB | Yes                                                                        |
| Range of values     | Any valid language name                                                    |
| Basic               | Yes                                                                        |

This language specified by NLS\_LANGUAGE is used for messages, day and month names, symbols for AD, BC, a.m., and p.m., and the default sorting mechanism. This parameter also determines the default values of the parameters NLS\_DATE\_LANGUAGE and NLS\_SORT.

### Note:

The value of this initialization parameter NLS\_LANGUAGE is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the NLS\_LANG client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

### Examples

See these examples of using the NLS\_LANGUAGE parameter:

- For an example of setting NLS\_LANGUAGE to Italian, see *Oracle Database Globalization Support Guide*.
- For an example of overriding default values for NLS\_LANGUAGE and NLS\_TERRITORY during a session, see *Oracle Database Globalization Support Guide*.

 **See Also:**

## 2.245 NLS\_LENGTH\_SEMANTICS

NLS\_LENGTH\_SEMANTICS is used to specify length semantics.

| Property                   | Description                                                                    |
|----------------------------|--------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                         |
| <b>Syntax</b>              | NLS_LENGTH_SEMANTICS = <i>string</i><br>Example: NLS_LENGTH_SEMANTICS = 'CHAR' |
| <b>Default value</b>       | BYTE                                                                           |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                                    |
| <b>Modifiable in a PDB</b> | Yes                                                                            |
| <b>Range of values</b>     | BYTE   CHAR                                                                    |
| <b>Basic</b>               | No                                                                             |

The session-level value of NLS\_LENGTH\_SEMANTICS specifies the default length semantics to use for VARCHAR2 and CHAR table columns, user-defined object attributes, and PL/SQL variables in database objects created in the session. This default may be overridden by the explicit length semantics qualifiers BYTE and CHAR in column, attribute, and variable definitions.

The instance-level value of NLS\_LENGTH\_SEMANTICS provides a default for the session-level value if NLS\_LENGTH\_SEMANTICS is not set explicitly by the database client through the NLS\_LENGTH\_SEMANTICS client environment variable (does not apply to JDBC Thin clients), or the ALTER SESSION SET NLS\_LENGTH\_SEMANTICS statement.

NCHAR, NVARCHAR2, CLOB, and NCLOB columns are always character-based.

Sessions logged in as SYS do not use the NLS\_LENGTH\_SEMANTICS parameter. They use BYTE length semantics for all created objects unless overridden by the explicit BYTE and CHAR qualifiers in object definitions (SQL DDL statements).

**Note:**

Oracle strongly recommends that you do NOT set the `NLS_LENGTH_SEMANTICS` parameter to `CHAR` in the instance or server parameter file. This may cause many existing installation scripts to unexpectedly create columns with character length semantics, resulting in run-time errors, including buffer overflows.

**See Also:**

*Oracle Database Globalization Support Guide* for more information about this parameter

## 2.246 NLS\_NCHAR\_CONV\_EXCP

`NLS_NCHAR_CONV_EXCP` determines whether an error is reported when there is data loss during an implicit or explicit character type conversion between `NCHAR/NVARCHAR2` and `CHAR/VARCHAR2`.

| Property            | Description                                         |
|---------------------|-----------------------------------------------------|
| Parameter type      | String                                              |
| Syntax              | <code>NLS_NCHAR_CONV_EXCP = { TRUE   FALSE }</code> |
| Default value       | <code>FALSE</code>                                  |
| Modifiable          | <code>ALTER SESSION, ALTER SYSTEM</code>            |
| Modifiable in a PDB | Yes                                                 |
| Basic               | No                                                  |

The default value results in no error being reported.

**See Also:**

*Oracle Database Globalization Support Guide* for more information about this parameter

## 2.247 NLS\_NUMERIC\_CHARACTERS

`NLS_NUMERIC_CHARACTERS` specifies the characters to use as the group separator and decimal character.

| Property       | Description |
|----------------|-------------|
| Parameter type | String      |

| Property                   | Description                                                     |
|----------------------------|-----------------------------------------------------------------|
| <b>Syntax</b>              | NLS_NUMERIC_CHARACTERS =<br>"decimal_character group_separator" |
| <b>Default value</b>       | Derived from NLS_TERRITORY                                      |
| <b>Modifiable</b>          | ALTER SESSION                                                   |
| <b>Modifiable in a PDB</b> | Yes                                                             |
| <b>Basic</b>               | No                                                              |

NLS\_NUMERIC\_CHARACTERS overrides those characters defined implicitly by NLS\_TERRITORY. The group separator separates integer groups (that is, thousands, millions, billions, and so on). The decimal separates the integer portion of a number from the decimal portion.

You can specify any character as the decimal or group separator. The two characters specified must be single-byte and must be different from each other. The characters cannot be any numeric character or any of the following characters: plus (+), minus sign (-), less than sign (<), greater than sign (>). Either character can be a space.

For example, if you want to specify a comma as the decimal character and a space as the group separator, you would set this parameter as follows:

```
NLS_NUMERIC_CHARACTERS = ", "
```

#### Note:

The value of this initialization parameter NLS\_NUMERIC\_CHARACTERS is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the NLS\_LANG client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

#### See Also:

*Oracle Database Globalization Support Guide* for more information about this parameter

## 2.248 NLS\_SORT

NLS\_SORT specifies the collating sequence for character value comparison in various SQL operators and clauses.

| Property              | Description                                          |
|-----------------------|------------------------------------------------------|
| <b>Parameter type</b> | String                                               |
| <b>Syntax</b>         | NLS_SORT = { BINARY   <i>linguistic_definition</i> } |
| <b>Default value</b>  | Derived from NLS_LANGUAGE                            |

| Property                   | Description                                    |
|----------------------------|------------------------------------------------|
| <b>Modifiable</b>          | ALTER SESSION                                  |
| <b>Modifiable in a PDB</b> | Yes                                            |
| <b>Range of values</b>     | BINARY or any valid linguistic definition name |
| <b>Basic</b>               | No                                             |

For example, `NLS_SORT` specifies the collating sequence for character value comparison in these SQL operators and clauses: `ORDER BY`, `GROUP BY`, comparison conditions (`=`, `<>`, `<=`, `>=`), `IN`, `BETWEEN`, `LIKE`, `MIN/MAX`, `GREATEST/LEAST`, and `INSTR`.

- If the value is `BINARY`, then comparison is based directly on byte values in the binary encoding of the character values being compared. The ordering depends on the character set of the compared values, which is either the database character set (for `VARCHAR2`, `CHAR`, `LONG`, and `CLOB`) or the national character set (for `NVARCHAR2`, `NCHAR`, and `NCLOB`).
- If the value is a named linguistic sort, then comparison is defined by this sort. A linguistic sort uses various rules to achieve ordering expected by speakers of one or more natural languages. This is usually the same ordering that is used in dictionaries and telephone directories in those languages.

The exact operators and query clauses that obey the `NLS_SORT` parameter depend on the value of the `NLS_COMP` parameter. If an operator or clause does not obey the `NLS_SORT` value, as determined by `NLS_COMP`, the collation used is `BINARY`.

The `BINARY` comparison is faster and uses less resources than any linguistic comparison but for text in a natural language, it does not provide ordering expected by users.

The value of `NLS_SORT` affects execution plans of queries. Because a standard index cannot be used as a source of values sorted in a linguistic order, an explicit sort operation must usually be performed instead of an index range scan. A functional index on the `NLSSORT` function may be defined to provide values sorted in a linguistic order and reintroduce the index range scan to the execution plan.

 **Note:**

The value of the initialization parameter `NLS_SORT` is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the `NLS_LANG` client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

 **See Also:**

- *Oracle Database Globalization Support Guide* for more information about this parameter and a current listing of values you can specify

## 2.249 NLS\_TERRITORY

NLS\_TERRITORY specifies the name of the territory whose conventions are to be followed for day and week numbering.

| Property            | Description                      |
|---------------------|----------------------------------|
| Parameter type      | String                           |
| Syntax              | NLS_TERRITORY = <i>territory</i> |
| Default value       | Operating system-dependent       |
| Modifiable          | ALTER SESSION                    |
| Modifiable in a PDB | Yes                              |
| Range of values     | Any valid territory name         |
| Basic               | Yes                              |

This parameter also establishes the default date format, the default decimal character and group separator, and the default ISO and local currency symbols.

For information on these settings, see ["NLS\\_DATE\\_FORMAT"](#), ["NLS\\_NUMERIC\\_CHARACTERS"](#), ["NLS\\_CURRENCY"](#), and ["NLS\\_ISO\\_CURRENCY"](#).

### Note:

The value of this initialization parameter NLS\_TERRITORY is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the NLS\_LANG client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

### Examples

For an example of overriding the default value for the NLS\_TERRITORY parameter, see *Oracle Database Globalization Support Guide*.

### See Also:

- *Oracle Database Globalization Support Guide* for a complete list of territories
- Your operating system-specific Oracle documentation for the territory-dependent default values for these parameters

## 2.250 NLS\_TIMESTAMP\_FORMAT

NLS\_TIMESTAMP\_FORMAT defines the default timestamp format to use with the TO\_CHAR and TO\_TIMESTAMP functions.

| Property            | Description                     |
|---------------------|---------------------------------|
| Parameter type      | String                          |
| Syntax              | NLS_TIMESTAMP_FORMAT = "format" |
| Default value       | Derived from NLS_TERRITORY      |
| Modifiable          | ALTER SESSION                   |
| Modifiable in a PDB | Yes                             |
| Range of values     | Any valid datetime format mask  |
| Basic               | No                              |

The value must be surrounded by quotation marks as follows:

```
NLS_TIMESTAMP_FORMAT = 'YYYY-MM-DD HH:MI:SS.FF'
```

You can specify the value of NLS\_TIMESTAMP\_FORMAT by setting it in the initialization parameter file. You can specify its value for a client as a client environment variable.

You can also alter the value of NLS\_TIMESTAMP\_FORMAT by changing its value in the initialization parameter and then restarting the instance. To alter the value during a session use the ALTER SESSION SET statement.

**Note:**

The value of this initialization parameter NLS\_TIMESTAMP\_FORMAT is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the NLS\_LANG client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

**See Also:**

*Oracle Database Globalization Support Guide* for more information about this parameter

## 2.251 NLS\_TIMESTAMP\_TZ\_FORMAT

NLS\_TIMESTAMP\_TZ\_FORMAT defines the default timestamp with time zone format to use with the TO\_CHAR and TO\_TIMESTAMP\_TZ functions.

| Property       | Description                        |
|----------------|------------------------------------|
| Parameter type | String                             |
| Syntax         | NLS_TIMESTAMP_TZ_FORMAT = "format" |
| Default value  | Derived from NLS_TERRITORY         |
| Modifiable     | ALTER SESSION                      |

| Property                   | Description                    |
|----------------------------|--------------------------------|
| <b>Modifiable in a PDB</b> | Yes                            |
| <b>Range of values</b>     | Any valid datetime format mask |
| <b>Basic</b>               | No                             |

The value must be surrounded by quotation marks as follows:

```
NLS_TIMESTAMP_TZ_FORMAT = 'YYYY-MM-DD HH:MI:SS.FF TZH:TZM'
```

You can specify the value of `NLS_TIMESTAMP_TZ_FORMAT` by setting it in the initialization parameter file. You can specify its value for a client as a client environment variable.

You can also alter the value of `NLS_TIMESTAMP_TZ_FORMAT` by changing its value in the initialization parameter and then restarting the instance. To alter the value during a session use the `ALTER SESSION SET` statement.

 **Note:**

The value of this initialization parameter `NLS_TIMESTAMP_TZ_FORMAT` is used to initialize the session value of this parameter, which is the actual value referenced by the SQL query processing. This initial value is overridden by a client-side value if the client uses the Oracle JDBC driver or if the client is OCI-based and the `NLS_LANG` client setting (environment variable) is defined. The initialization parameter value is, therefore, usually ignored.

 **See Also:**

*Oracle Database Globalization Support Guide* for more information about this parameter

## 2.252 NONCDB\_COMPATIBLE

`NONCDB_COMPATIBLE` enables you to get behavior similar to a non-CDB when issuing SQL commands inside a PDB in a CDB.

| Property                   | Description  |
|----------------------------|--------------|
| <b>Parameter type</b>      | Boolean      |
| <b>Default value</b>       | false        |
| <b>Modifiable</b>          | No           |
| <b>Modifiable in a PDB</b> | No           |
| <b>Range of values</b>     | true   false |
| <b>Basic</b>               | No           |

Set this parameter if you are using a single PDB in your CDB configuration and you have legacy code that causes ORA-65040 when you run it in the PDB.

### Values

- **TRUE**  
Indicates the behavior for SQL statements will be like a non-CDB although the statements are issued in a PDB in a CDB.
- **FALSE**  
Indicates the behavior will for SQL statements will be like a CDB. This is the default value of the parameter.

There are some statements (such as `ALTER DB BACKUP CONTROLFILE`) which can be issued in a non-CDB, but in a CDB they must be issued in the root (because they affect the whole CDB) and would result in an error if issued in a PDB.

Some `ALTER DATABASE` or `ALTER SYSTEM` statements are not permitted inside a PDB, and they will fail if `NONCDB_COMPATIBLE=FALSE` is set in `init.ora`. However, these statements will succeed if `NONCDB_COMPATIBLE=TRUE` is set.

### See Also:

- *Oracle Multitenant Administrator's Guide* for an introduction to PDBs and CDBs

- *Oracle Multitenant Administrator's Guide* for information about the `ALTER SYSTEM` statements that can be run in a PDB.

## 2.253 OBJECT\_CACHE\_MAX\_SIZE\_PERCENT

The **object cache** is a memory block on the client that allows applications to store entire objects and to navigate among them without round trips to the server.

`OBJECT_CACHE_MAX_SIZE_PERCENT` specifies the percentage of the optimal cache size that the session object cache can grow past the optimal size.

| Property                   | Description                                           |
|----------------------------|-------------------------------------------------------|
| <b>Parameter type</b>      | Integer                                               |
| <b>Default value</b>       | 10                                                    |
| <b>Modifiable</b>          | <code>ALTER SESSION, ALTER SYSTEM ... DEFERRED</code> |
| <b>Modifiable in a PDB</b> | Yes                                                   |
| <b>Range of values</b>     | 0 to operating system-dependent maximum               |
| <b>Basic</b>               | No                                                    |

The maximum size is equal to the optimal size plus the product of this percentage and the optimal size. When the cache size exceeds this maximum size, the system will attempt to shrink the cache to the optimal size.

 **See Also:**

- ["OBJECT\\_CACHE\\_OPTIMAL\\_SIZE"](#) for a description of the object cache
- *Pro\*C/C++ Developer's Guide* and *Oracle Call Interface Developer's Guide* for information on precompiler use of the object cache

## 2.254 OBJECT\_CACHE\_OPTIMAL\_SIZE

OBJECT\_CACHE\_OPTIMAL\_SIZE specifies (in bytes) the size to which the session object cache is reduced when the size of the cache exceeds the maximum size.

| Property                   | Description                                 |
|----------------------------|---------------------------------------------|
| <b>Parameter type</b>      | Integer                                     |
| <b>Default value</b>       | 51200000 (50M)                              |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM ... DEFERRED    |
| <b>Modifiable in a PDB</b> | Yes                                         |
| <b>Range of values</b>     | 10 KB to operating system-dependent maximum |
| <b>Basic</b>               | No                                          |

The **object cache** is a memory block on the client that allows applications to store entire objects and to navigate among them without round trips to the server. On the server, it is used to cache frequently used objects requested as a result of client requests to help in performance.

 **See Also:**

*Pro\*C/C++ Developer's Guide* and *Oracle Call Interface Developer's Guide* for information on precompiler use of the object cache

## 2.255 OFS\_THREADS

OFS\_THREADS sets the maximum number of Oracle file system (OFS) threads that can be started to service Oracle file system requests.

| Property                   | Description                                          |
|----------------------------|------------------------------------------------------|
| <b>Parameter type</b>      | Integer                                              |
| <b>Default value</b>       | 4                                                    |
| <b>Modifiable</b>          | ALTER SYSTEM                                         |
| <b>Modifiable in a PDB</b> | No                                                   |
| <b>Range of values</b>     | 2 to 128                                             |
| <b>Basic</b>               | No                                                   |
| <b>Oracle RAC</b>          | The same value should be specified on all instances. |

**Note:**

This initialization parameter is supported only on the Linux operating system.

**See Also:**

*Oracle Database Administrator's Guide* for more information about the Oracle Database NFS server feature

## 2.256 OLAP\_PAGE\_POOL\_SIZE

OLAP\_PAGE\_POOL\_SIZE specifies (in bytes) the size of the OLAP page pool.

| Property            | Description                                      |
|---------------------|--------------------------------------------------|
| Parameter type      | Big integer                                      |
| Syntax              | OLAP_PAGE_POOL_SIZE = <i>integer</i> [K   M   G] |
| Default value       | 0                                                |
| Modifiable          | ALTER SESSION, ALTER SYSTEM ... DEFERRED         |
| Modifiable in a PDB | Yes                                              |
| Range of values     | 0, 2097152 (2 MB) to $2^{31} - 1$                |
| Basic               | No                                               |

**Caution:**

Oracle strongly recommends that you leave this parameter set to its default value of 0. This instructs the database to autonomously adjust the OLAP page pool size to serve the requirements of the analytic workspaces. Setting this parameter to a value other than 0 can lead to errors in OLAP processing or wasted memory.

**See Also:**

*Oracle OLAP User's Guide* for more information about the OLAP option for Oracle Database

## 2.257 ONE\_STEP\_PLUGIN\_FOR\_PDB\_WITH\_TDE

If a pluggable database (PDB) has Transparent Data Encryption-encrypted (TDE-encrypted) tables or tablespaces, you can enable `ONE_STEP_PLUGIN_FOR_PDB_WITH_TDE` on the target CDB to simplify the move of TDE keys in a single step PDB move operation.

`ONE_STEP_PLUGIN_FOR_PDB_WITH_TDE` eliminates the need of having to manually provide a keystore password when you import the TDE keys into the PDB after it has moved to the target CDB.

| Property                   | Description                                                                        |
|----------------------------|------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Boolean                                                                            |
| <b>Default value</b>       | FALSE                                                                              |
| <b>Modifiable</b>          | ALTER SYSTEM                                                                       |
| <b>Modifiable in a PDB</b> | No                                                                                 |
| <b>Range of values</b>     | true   false                                                                       |
| <b>Basic</b>               | No                                                                                 |
| <b>Oracle RAC</b>          | A different value can be set for this parameter on different Oracle RAC instances. |

The default for `ONE_STEP_PLUGIN_FOR_PDB_WITH_TDE` is FALSE.

When `ONE_STEP_PLUGIN_FOR_PDB_WITH_TDE` is set to TRUE on the target CDB, the plug in of the PDB does not require a keystore password.

### Note:

The `ONE_STEP_PLUGIN_FOR_PDB_WITH_TDE` parameter is deprecated in Oracle Database 23ai.

`ONE_STEP_PLUGIN_FOR_PDB_WITH_TDE` enables you to clone remotely or to relocate encrypted PDBs without providing the Transparent Data Encryption (TDE) keystore password. However, `EXTERNAL STORE` provides the same functionality, and is universally applicable to all `ADMINISTER KEY MANAGEMENT` statements that do not change the TDE configuration. Instead of using `ONE_STEP_PLUGIN_FOR_PDB_WITH_TDE`, Oracle recommends that you use the `IDENTIFIED BY EXTERNAL STORE` clause for the `ADMINISTER KEY MANAGEMENT` statement.

## 2.258 OPEN\_CURSORS

`OPEN_CURSORS` specifies the maximum number of open cursors (handles to private SQL areas) a session can have at once. You can use this parameter to prevent a session from opening an excessive number of cursors.

| Property              | Description |
|-----------------------|-------------|
| <b>Parameter type</b> | Integer     |

| Property            | Description  |
|---------------------|--------------|
| Default value       | 50           |
| Modifiable          | ALTER SYSTEM |
| Modifiable in a PDB | Yes          |
| Range of values     | 0 to 65535   |
| Basic               | Yes          |

It is important to set the value of `OPEN_CURSORS` high enough to prevent your application from running out of open cursors. The number will vary from one application to another. Assuming that a session does not open the number of cursors specified by `OPEN_CURSORS`, there is no added overhead to setting this value higher than actually needed.

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information on setting this parameter
- Your operating system-specific Oracle documentation for the range of values

## 2.259 OPEN\_LINKS

`OPEN_LINKS` specifies the maximum number of concurrent open connections to remote databases in one session. These connections include database links, as well as external procedures and cartridges, each of which uses a separate process.

| Property            | Description |
|---------------------|-------------|
| Parameter type      | Integer     |
| Default value       | 4           |
| Modifiable          | No          |
| Modifiable in a PDB | Yes         |
| Range of values     | 0 to 32768  |
| Basic               | No          |

Oracle counts one open link for the following:

- For each user that references a public or private database link
- For each external procedure or cartridge connection when it is executed for the first time

Both types of connections close when the session ends. You can also close a database link connection explicitly by issuing an `ALTER SESSION CLOSE DATABASE LINK` statement.

You should set this parameter to allow for the external procedure and cartridge connections expected during the session plus the number of databases referred to in typical distributed transactions (that is, a single SQL statement that references multiple databases), so that all the databases can be open to execute the statement. For example, if queries alternately access databases A, B, and C, and `OPEN_LINKS` is set to 2, time will be lost waiting while one

connection is broken and another made. Increase the value if many different databases are accessed over time.

This parameter refers only to connections used for distributed transactions. Direct connections to a remote database specified as an application connects are not counted.

If you set `OPEN_LINKS` to 0, then no distributed transactions are allowed.

In a multitenant container database (CDB), the `OPEN_LINKS` parameter can be set at both the root and at the PDB level using either an initialization parameter file (PFILE) or server parameter file (SPFILE). You need to restart the instance or reopen the PDB for a new `OPEN_LINKS` value to become effective.

**See Also:**

"[OPEN\\_LINKS\\_PER\\_INSTANCE](#)" for information on setting open connections globally for a database instance

## 2.260 OPEN\_LINKS\_PER\_INSTANCE

`OPEN_LINKS_PER_INSTANCE` specifies the maximum number of migratable open connections globally for each database instance.

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Parameter type</b>      | Integer                                       |
| <b>Default value</b>       | 4                                             |
| <b>Modifiable</b>          | No                                            |
| <b>Modifiable in a PDB</b> | No                                            |
| <b>Range of values</b>     | 0 to $2^{31} - 1$                             |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Multiple instances can have different values. |

XA transactions use migratable open connections so that the connections are cached after a transaction is committed. Another transaction can use the connection, provided the user who created the connection is the same as the user who owns the transaction.

`OPEN_LINKS_PER_INSTANCE` is different from `OPEN_LINKS`, which indicates the number of connections from a session. The `OPEN_LINKS` parameter is not applicable to XA applications.

**See Also:**

- "[OPEN\\_LINKS](#)"
- *Oracle Database Development Guide* for more information about using this parameter in Oracle XA applications

## 2.261 OPTIMIZER\_ADAPTIVE\_PLANS

`OPTIMIZER_ADAPTIVE_PLANS` controls adaptive plans. Adaptive plans are execution plans built with alternative choices that are decided at run time based on statistics collected as the query executes.

| Property                   | Description                                 |
|----------------------------|---------------------------------------------|
| <b>Parameter type</b>      | Boolean                                     |
| <b>Default value</b>       | true                                        |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                 |
| <b>Modifiable in a PDB</b> | Yes                                         |
| <b>Range of values</b>     | true   false                                |
| <b>Basic</b>               | No                                          |
| <b>Oracle RAC</b>          | The same value must be set on all instances |

Setting this parameter to `false` disables the following adaptive features:

- Nested loop join/hash join selection
- Star transformation bitmap pruning
- Adaptive parallel distribution method

### See Also:

*Oracle Database SQL Tuning Guide* for information about adaptive plans

## 2.262 OPTIMIZER\_ADAPTIVE\_REPORTING\_ONLY

`OPTIMIZER_ADAPTIVE_REPORTING_ONLY` controls reporting-only mode for adaptive optimizations.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Boolean                     |
| <b>Default value</b>       | FALSE                       |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | TRUE   FALSE                |
| <b>Basic</b>               | No                          |

When `OPTIMIZER_ADAPTIVE_REPORTING_ONLY` is set to `FALSE`, reporting-only mode is off, and the adaptive optimizations are enabled as usual.

When `OPTIMIZER_ADAPTIVE_REPORTING_ONLY` is set to `TRUE`, adaptive optimizations run in reporting-only mode. With this setting, the information required for an adaptive optimization is gathered, but no action is taken to change the plan. For instance, an adaptive plan will always

choose the default (optimizer-chosen) plan, but information is collected on what plan to adapt to in non-reporting mode. This information can be viewed in the adaptive plan report.

This parameter affects only adaptive optimizations that are enabled.

## 2.263 OPTIMIZER\_ADAPTIVE\_STATISTICS

`OPTIMIZER_ADAPTIVE_STATISTICS` controls adaptive statistics. Some query shapes are too complex to rely on base table statistics alone, so the optimizer augments these statistics with adaptive statistics.

| Property                   | Description                                 |
|----------------------------|---------------------------------------------|
| <b>Parameter type</b>      | Boolean                                     |
| <b>Default value</b>       | false                                       |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                 |
| <b>Modifiable in a PDB</b> | Yes                                         |
| <b>Range of values</b>     | true   false                                |
| <b>Basic</b>               | No                                          |
| <b>Oracle RAC</b>          | The same value must be set on all instances |

Setting this parameter to `false` disables the following adaptive features:

- SQL plan directives
- Statistics feedback for joins
- Adaptive dynamic sampling for parallel execution

 **Note:**

Setting `OPTIMIZER_ADAPTIVE_STATISTICS` to `false` preserves the statistics feedback functionality that was introduced in Oracle Database 11g.

`OPTIMIZER_ADAPTIVE_STATISTICS` does not control the creation of SQL plan directives. SQL plan directives will be created even if this parameter is `false`, but they will not be used to refine SQL execution plans with dynamic sampling.

**See Also:**

*Oracle Database SQL Tuning Guide* for information about adaptive plans

## 2.264 OPTIMIZER\_CAPTURE\_SQL\_PLAN\_BASELINES

`OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES` enables or disables the automatic recognition of repeatable SQL statements, as well as the generation of SQL plan baselines for such statements.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Boolean                     |
| <b>Default value</b>       | false                       |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | true   false                |
| <b>Basic</b>               | No                          |

**See Also:**

*Oracle Database SQL Tuning Guide* for more information about the optimizer

## 2.265 OPTIMIZER\_CAPTURE\_SQL\_QUARANTINE

`OPTIMIZER_CAPTURE_SQL_QUARANTINE` enables or disables the automatic creation of SQL Quarantine configurations.

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Parameter type</b>      | Boolean                                       |
| <b>Default value</b>       | false                                         |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                   |
| <b>Modifiable in a PDB</b> | Yes                                           |
| <b>Range of values</b>     | true   false                                  |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Different instances can use different values. |

**Values:**

- true

Enables the automatic creation of SQL Quarantine configurations. If the Resource Manager terminates a SQL statement because the statement has exceeded resource limits, then the database automatically creates a SQL Quarantine configuration for the

execution plan used by the terminated SQL statement. Note that the *plan* for a terminated SQL statement is quarantined, not the statement itself.

- `false`

Disables the automatic creation of SQL Quarantine configurations.

## 2.266 OPTIMIZER\_CROSS\_SHARD\_RESILIENCY

`OPTIMIZER_CROSS_SHARD_RESILIENCY` enables resilient execution of cross shard queries.

| Property            | Description                                            |
|---------------------|--------------------------------------------------------|
| Parameter type      | Boolean                                                |
| Default value       | <code>false</code>                                     |
| Modifiable          | <code>ALTER SESSION</code> , <code>ALTER SYSTEM</code> |
| Modifiable in a PDB | Yes                                                    |
| Range of values     | <code>true</code>   <code>false</code>                 |
| Basic               | No                                                     |
| Oracle RAC          | The same value must be used on all instances.          |

When this parameter is set to `true` and a cross-shard query fails on one or more shards, the query execution continues on the Oracle Data Guard standbys of the failed shards. This parameter is not set to `true` by default, because there may be performance overhead for the resilient query execution.

## 2.267 OPTIMIZER\_DYNAMIC\_SAMPLING

`OPTIMIZER_DYNAMIC_SAMPLING` controls both when the database gathers dynamic statistics, and the size of the sample that the optimizer uses to gather the statistics.

| Property            | Description                                                                                                                                                                                                                     |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | Integer                                                                                                                                                                                                                         |
| Default value       | If <code>OPTIMIZER_FEATURES_ENABLE</code> is set to 10.0.0 or higher, then 2<br>If <code>OPTIMIZER_FEATURES_ENABLE</code> is set to 9.2.0, then 1<br>If <code>OPTIMIZER_FEATURES_ENABLE</code> is set to 9.0.1 or lower, then 0 |
| Modifiable          | <code>ALTER SESSION</code> , <code>ALTER SYSTEM</code>                                                                                                                                                                          |
| Modifiable in a PDB | Yes                                                                                                                                                                                                                             |
| Range of values     | 0 to 11                                                                                                                                                                                                                         |

| Property | Description |
|----------|-------------|
| Basic    | No          |

**Note:**

Dynamic statistics were called dynamic sampling in releases earlier than Oracle Database 12c Release 1 (12.1).

If the value of `OPTIMIZER_DYNAMIC_SAMPLING` is set to 11, the `OPTIMIZER_FEATURES_ENABLE` setting has no effect on the `OPTIMIZER_DYNAMIC_SAMPLING` setting.

**See Also:**

*Oracle Database SQL Tuning Guide* for detailed information about the values (0 – 11) that can be set for the `OPTIMIZER_DYNAMIC_SAMPLING` parameter.

## 2.268 OPTIMIZER\_FEATURES\_ENABLE

`OPTIMIZER_FEATURES_ENABLE` acts as an umbrella parameter for enabling a series of optimizer features based on an Oracle release number.

| Property            | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | String                                                                                                                                                                                                                                                                                                                                                                                                               |
| Syntax              | <code>OPTIMIZER_FEATURES_ENABLE = { 8.0.0   8.0.3   8.0.4   8.0.5   8.0.6   8.0.7   8.1.0   8.1.3   8.1.4   8.1.5   8.1.6   8.1.7   9.0.0   9.0.1   9.2.0   9.2.0.8   10.1.0   10.1.0.3   10.1.0.4   10.1.0.5   10.2.0.1   10.2.0.2   10.2.0.3   10.2.0.4   10.2.0.5   11.1.0.6   11.1.0.7   11.2.0.1   11.2.0.2   11.2.0.3   11.2.0.4   12.1.0.1   12.1.0.2   12.2.0.1   18.1.0   19.1.0   21.1.0   23.1.0 }</code> |
| Default value       | 23.1.0                                                                                                                                                                                                                                                                                                                                                                                                               |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                                                                                                                                                                                                                                                                                                                                                                                          |
| Modifiable in a PDB | Yes                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Basic               | No                                                                                                                                                                                                                                                                                                                                                                                                                   |

For example, if you upgrade your database from release 19c to release 23ai, but you want to keep the release 19c optimizer behavior, you can do so by setting this parameter to 19.1.0. At a later time, you can try the enhancements introduced in releases up to and including release 23ai by setting the parameter to 23.1.0.

**Note:**

When setting this parameter to a value representing Oracle Database 18c or later, you must specify three numeric values separated by periods, such as 21.1.0 or 23.1.0.

Table 2-6 describes some of the optimizer features that are enabled when you set the `OPTIMIZER_FEATURES_ENABLE` parameter to 12.1.0.2 or a later release.

**Table 2-6 Optimizer Features for Oracle Database 12c and Later Releases**

| Features                                                              | 12.1.0.2 | 12.2.0.1 | 18c | 19c | 21c | 23ai |
|-----------------------------------------------------------------------|----------|----------|-----|-----|-----|------|
| Adaptive Query Optimization                                           | X        | X        | X   | X   | X   | X    |
| Online statistics gathering for bulk loads                            | X        | X        | X   | X   | X   | X    |
| Session level statistics for Global Temporary Tables                  | X        | X        | X   | X   | X   | X    |
| Multi-table left outer joins                                          | X        | X        | X   | X   | X   | X    |
| Lateral views                                                         | X        | X        | X   | X   | X   | X    |
| Batch table access by rowid                                           | X        | X        | X   | X   | X   | X    |
| Null accepting semi joins                                             | X        | X        | X   | X   | X   | X    |
| Scalar subquery unnesting                                             | X        | X        | X   | X   | X   | X    |
| Conversion of joins that produce unnecessary duplicates to semi-joins | X        | X        | X   | X   | X   | X    |
| Parallel Union and Parallel Union All operations                      | X        | X        | X   | X   | X   | X    |
| Enhance Auto DOP                                                      | X        | X        | X   | X   | X   | X    |
| Approximate count distinct                                            | X        | X        | X   | X   | X   | X    |
| Support for Oracle Database In-Memory                                 | X        | X        | X   | X   | X   | X    |
| Group-by and aggregation elimination                                  | X        | X        | X   | X   | X   | X    |
| Query rewrite for approximate query processing                        |          | X        | X   | X   | X   | X    |
| Statistics advisor                                                    |          | X        | X   | X   | X   | X    |
| Support for sharded databases                                         |          | X        | X   | X   | X   | X    |
| Expression tracking                                                   |          | X        | X   | X   | X   | X    |
| Space-saving algorithm for partition synopses                         |          | X        | X   | X   | X   | X    |

## 2.269 OPTIMIZER\_IGNORE\_HINTS

OPTIMIZER\_IGNORE\_HINTS enables embedded hints to be ignored.

| Property                   | Description                                         |
|----------------------------|-----------------------------------------------------|
| <b>Parameter type</b>      | Boolean                                             |
| <b>Default value</b>       | FALSE                                               |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                         |
| <b>Modifiable in a PDB</b> | Yes                                                 |
| <b>Range of values</b>     | true   false                                        |
| <b>Basic</b>               | No                                                  |
| <b>Oracle RAC</b>          | Different values can be set on different instances. |

When this parameter is set to `TRUE`, the optimizer ignores embedded hints.

The default value is `FALSE`. When this parameter's value is `FALSE`, the optimizer does not ignore embedded hints.

## 2.270 OPTIMIZER\_IGNORE\_PARALLEL\_HINTS

OPTIMIZER\_IGNORE\_PARALLEL\_HINTS enables embedded parallel hints to be ignored.

| Property                   | Description                                         |
|----------------------------|-----------------------------------------------------|
| <b>Parameter type</b>      | Boolean                                             |
| <b>Default value</b>       | FALSE                                               |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                         |
| <b>Modifiable in a PDB</b> | Yes                                                 |
| <b>Range of values</b>     | true   false                                        |
| <b>Basic</b>               | No                                                  |
| <b>Oracle RAC</b>          | Different values can be set on different instances. |

When this parameter is set to `TRUE`, the optimizer ignores embedded parallel hints.

The default value is `FALSE`. When this parameter's value is `FALSE`, the optimizer does not ignore parallel embedded hints.

## 2.271 OPTIMIZER\_INDEX\_CACHING

`OPTIMIZER_INDEX_CACHING` lets you adjust the behavior of cost-based optimization to favor nested loops joins and IN-list iterators.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Integer                     |
| <b>Default value</b>       | 0                           |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | 0 to 100                    |
| <b>Basic</b>               | No                          |

The cost of executing an index using an IN-list iterator or of executing a nested loops join when an index is used to access the inner table depends on the caching of that index in the buffer cache. The amount of caching depends on factors that the optimizer cannot predict, such as the load on the system and the block access patterns of different users.

You can modify the optimizer's assumptions about index caching for nested loops joins and IN-list iterators by setting this parameter to a value between 0 and 100 to indicate the percentage of the index blocks the optimizer should assume are in the cache. Setting this parameter to a higher value makes nested loops joins and IN-list iterators look less expensive to the optimizer. As a result, it will be more likely to pick nested loops joins over hash or sort-merge joins and to pick indexes using IN-list iterators over other indexes or full table scans. The default for this parameter is 0, which results in default optimizer behavior.

### See Also:

*Oracle Database SQL Language Reference* for additional information about this initialization parameter

## 2.272 OPTIMIZER\_INDEX\_COST\_ADJ

`OPTIMIZER_INDEX_COST_ADJ` lets you tune optimizer behavior for access path selection to be more or less index friendly—that is, to make the optimizer more or less prone to selecting an index access path over a full table scan.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Integer                     |
| <b>Default value</b>       | 100                         |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |

| Property        | Description |
|-----------------|-------------|
| Range of values | 1 to 10000  |
| Basic           | No          |

The default for this parameter is 100 percent, at which the optimizer evaluates index access paths at the regular cost. Any other value makes the optimizer evaluate the access path at that percentage of the regular cost. For example, a setting of 50 makes the index access path look half as expensive as normal.

**Note:**

The adjustment does not apply to user-defined cost functions for domain indexes.

**See Also:**

*Oracle Database SQL Language Reference* for additional information about this initialization parameter

## 2.273 OPTIMIZER\_INMEMORY\_AWARE

`OPTIMIZER_INMEMORY_AWARE` enables or disables all of the optimizer cost model enhancements for in-memory.

| Property            | Description                             |
|---------------------|-----------------------------------------|
| Parameter type      | Boolean                                 |
| Default value       | true                                    |
| Modifiable          | ALTER SESSION, ALTER SYSTEM             |
| Modifiable in a PDB | Yes                                     |
| Range of values     | true   false                            |
| Basic               | No                                      |
| Oracle RAC          | All instances should use the same value |

Setting the parameter to `false` causes the optimizer to ignore the in-memory property of tables during the optimization of SQL statements. This behavior can also be achieved by setting the `OPTIMIZER_FEATURES_ENABLE` initialization parameter to values lower than 12.1.0.2.

**See Also:**

- "`OPTIMIZER_FEATURES_ENABLE`"
- *Oracle Database Concepts* and *Oracle Database SQL Tuning Guide* for more information about the optimizer

## 2.274 OPTIMIZER\_MODE

`OPTIMIZER_MODE` establishes the default behavior for choosing an optimization approach for the instance.

| Property                   | Description                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                                     |
| <b>Syntax</b>              | <code>OPTIMIZER_MODE =</code><br><code>{ FIRST_ROWS_[1   10   100   1000]   FIRST_ROWS   ALL_ROWS }</code> |
| <b>Default value</b>       | <code>ALL_ROWS</code>                                                                                      |
| <b>Modifiable</b>          | <code>ALTER SESSION, ALTER SYSTEM</code>                                                                   |
| <b>Modifiable in a PDB</b> | Yes                                                                                                        |
| <b>Basic</b>               | No                                                                                                         |

### Values

- `FIRST_ROWS_n`  
The optimizer uses a cost-based approach and optimizes with a goal of best response time to return the first *n* rows (where *n* = 1, 10, 100, 1000).
- `FIRST_ROWS`  
The optimizer uses a mix of costs and heuristics to find a best plan for fast delivery of the first few rows.  
`FIRST_ROWS` is available for backward compatibility and plan stability; use `FIRST_ROWS_n` instead.
- `ALL_ROWS`  
The optimizer uses a cost-based approach for all SQL statements in the session and optimizes with a goal of best throughput (minimum resource use to complete the entire statement).

## 2.275 OPTIMIZER\_REAL\_TIME\_STATISTICS

`OPTIMIZER_REAL_TIME_STATISTICS` controls whether the database automatically gathers real-time statistics during conventional DML operations.

| Property              | Description |
|-----------------------|-------------|
| <b>Parameter type</b> | Boolean     |

| Property                   | Description                                         |
|----------------------------|-----------------------------------------------------|
| <b>Default value</b>       | false                                               |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                         |
| <b>Modifiable in a PDB</b> | Yes                                                 |
| <b>Range of values</b>     | true   false                                        |
| <b>Basic</b>               | No                                                  |
| <b>Oracle RAC</b>          | Different values can be set on different instances. |

When this parameter is set to `true`, the database automatically gathers real-time statistics during conventional DML operations. The default setting is `false`, which means real-time statistics are disabled.

## 2.276 OPTIMIZER\_SESSION\_TYPE

`OPTIMIZER_SESSION_TYPE` controls how the database performs automatic indexing for SQL statements in the session.

| Property                   | Description                                                         |
|----------------------------|---------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                              |
| <b>Syntax</b>              | <code>OPTIMIZER_SESSION_TYPE = { NORMAL   CRITICAL   ADHOC }</code> |
| <b>Default value</b>       | NORMAL                                                              |
| <b>Modifiable</b>          | ALTER SESSION                                                       |
| <b>Modifiable in a PDB</b> | No                                                                  |
| <b>Basic</b>               | No                                                                  |

### Values:

- `NORMAL`  
Automatic indexing is performed normally for SQL statements in the session. The automatic indexing process identifies auto index candidates, creates auto indexes, and verifies them against SQL statements.
- `CRITICAL`  
Automatic indexing is performed for SQL statements in the session, with a higher priority given to long-running statements. The automatic indexing process identifies auto index candidates and creates auto indexes. However, auto indexes are verified against SQL statements in descending order of elapsed execution time for each statement.
- `ADHOC`  
Automatic indexing is suspended for SQL statements in the session. The automatic indexing process does not identify auto index candidates, create auto indexes, or verify auto indexes against SQL statements. This setting is useful when running ad hoc queries or testing new functionality.

**See Also:**

*Oracle Database Administrator's Guide* for more information about how automatic indexing works

## 2.277 OPTIMIZER\_USE\_INVISIBLE\_INDEXES

OPTIMIZER\_USE\_INVISIBLE\_INDEXES enables or disables the use of invisible indexes.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Boolean                     |
| <b>Default value</b>       | false                       |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | true   false                |
| <b>Basic</b>               | No                          |

### Values

- `true`  
Invisible indexes are treated as visible (normal) indexes.
- `false`  
Invisible indexes will not be considered by the optimizer but will still be maintained by DML operations.

## 2.278 OPTIMIZER\_USE\_PENDING\_STATISTICS

OPTIMIZER\_USE\_PENDING\_STATISTICS specifies whether the optimizer uses pending statistics when compiling SQL statements.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Boolean                     |
| <b>Default value</b>       | false                       |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | true   false                |
| <b>Basic</b>               | No                          |

**See Also:**

*Oracle Database SQL Tuning Guide* for more information on setting this parameter

## 2.279 OPTIMIZER\_USE\_SQL\_PLAN\_BASELINES

`OPTIMIZER_USE_SQL_PLAN_BASELINES` enables or disables the use of SQL plan baselines stored in SQL Management Base.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Boolean                     |
| <b>Default value</b>       | true                        |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | true   false                |
| <b>Basic</b>               | No                          |

When enabled, the optimizer looks for a SQL plan baseline for the SQL statement being compiled. If one is found in SQL Management Base, then the optimizer will cost each of the baseline plans and pick one with the lowest cost.

## 2.280 OPTIMIZER\_USE\_SQL\_QUARANTINE

`OPTIMIZER_USE_SQL_QUARANTINE` determines whether the optimizer considers SQL Quarantine configurations when choosing an execution plan for a SQL statement.

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Parameter type</b>      | Boolean                                       |
| <b>Default value</b>       | true                                          |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                   |
| <b>Modifiable in a PDB</b> | Yes                                           |
| <b>Range of values</b>     | true   false                                  |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Different instances can use different values. |

### Values:

- true

The optimizer considers SQL Quarantine configurations when choosing an execution plan for a SQL statement. The statement will be terminated if it would otherwise use a quarantined execution plan.

- `false`

The optimizer ignores SQL Quarantine configurations when choosing an execution plan for a SQL statement. It may use any execution plan, regardless of its quarantine status.

 **See Also:**

- ["OPTIMIZER\\_CAPTURE\\_SQL\\_QUARANTINE"](#)
- *Oracle Database SQL Tuning Guide* for more information about SQL Quarantine

## 2.281 OS\_AUTHENT\_PREFIX

OS\_AUTHENT\_PREFIX specifies a prefix that Oracle Database uses to authenticate users attempting to connect to the server.

| Property                   | Description                                      |
|----------------------------|--------------------------------------------------|
| <b>Parameter type</b>      | String                                           |
| <b>Syntax</b>              | OS_AUTHENT_PREFIX = <i>authentication_prefix</i> |
| <b>Default value</b>       | OPS\$                                            |
| <b>Modifiable</b>          | No                                               |
| <b>Modifiable in a PDB</b> | No                                               |
| <b>Basic</b>               | No                                               |

Oracle Database concatenates the value of this parameter to the beginning of the user's operating system account name. When a connection request is attempted, Oracle Database compares the prefixed username with Oracle user names in the database.

The default value of this parameter is OPS\$ for backward compatibility with previous versions. However, you might prefer to set the prefix value to "" (a null string), thereby eliminating the addition of any prefix to operating system account names.

 **Note:**

The text of the OS\_AUTHENT\_PREFIX parameter is case sensitive on some operating systems.

 **See Also:**

- *Oracle Database Security Guide* for more information on setting this parameter
- Your operating system-specific Oracle documentation for the default value

## 2.282 OS\_ROLES

OS\_ROLES determines whether Oracle or the operating system identifies and manages the roles of each username.

 **Note:**

Enterprise User Security (EUS) is deprecated with Oracle Database 23ai.

Oracle recommends that you migrate to using Centrally Managed Users (CMU). This feature enables you to directly connect with Microsoft Active Directory without an intervening directory service for enterprise user authentication and authorization to the database. If your Oracle Database is in the cloud, you can also choose to move to one of the newer integrations with a cloud identity provider.

| Property                   | Description  |
|----------------------------|--------------|
| <b>Parameter type</b>      | Boolean      |
| <b>Default value</b>       | false        |
| <b>Modifiable</b>          | No           |
| <b>Modifiable in a PDB</b> | No           |
| <b>Range of values</b>     | true   false |
| <b>Basic</b>               | No           |

### Values

- TRUE

The operating system completely manages the role grants for all database usernames. When a user attempts to create a session, the username's security domain is initialized using the roles identified by the operating system.

Revocation by Oracle of roles granted by the operating system is ignored, as are any roles previously granted by Oracle.

- FALSE

Oracle identifies and manages the roles.

 **See Also:**

- *Oracle Database Administrator's Guide* and *Oracle Database Enterprise User Security Administrator's Guide* for more information on roles and on setting this parameter
- ["REMOTE\\_OS\\_ROLES"](#)

## 2.283 OUTBOUND\_DBLINK\_PROTOCOLS

OUTBOUND\_DBLINK\_PROTOCOLS specifies the network protocols allowed for communicating for outbound database links in the database.

| Property                   | Description                                                                     |
|----------------------------|---------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                          |
| <b>Syntax</b>              | OUTBOUND_DBLINK_PROTOCOLS = { ALL   NONE   [ TCP   [, ]   TCPS   [, ]   IPC ] } |
| <b>Default value</b>       | ALL                                                                             |
| <b>Modifiable</b>          | ALTER SYSTEM                                                                    |
| <b>Modifiable in a PDB</b> | No                                                                              |
| <b>Basic</b>               | No                                                                              |
| <b>Oracle RAC</b>          | The same value must be used on all instances.                                   |

Specify a value of ALL to allow all network protocols, and a value of NONE to disallow all network communication protocols for database link communication. Specify a single value or a list of comma separated network communication protocols to allow only certain network protocols for outbound database link communication.

## 2.284 PARALLEL\_ADAPTIVE\_MULTI\_USER

PARALLEL\_ADAPTIVE\_MULTI\_USER, when set to true, enables an adaptive algorithm designed to improve performance in multiuser environments that use parallel execution.

| Property                   | Description  |
|----------------------------|--------------|
| <b>Parameter type</b>      | Boolean      |
| <b>Default value</b>       | false        |
| <b>Modifiable</b>          | ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | No           |
| <b>Range of values</b>     | true   false |
| <b>Basic</b>               | No           |

The algorithm automatically reduces the requested degree of parallelism based on the system load at query startup time. The effective degree of parallelism is based on the default degree of parallelism, or the degree from the table or hints, divided by a reduction factor.

The algorithm assumes that the system has been tuned for optimal performance in a single-user environment.

Tables and hints use the default degree of parallelism.

**Note:**

The `PARALLEL_ADAPTIVE_MULTI_USER` initialization parameter is deprecated in Oracle Database 12c Release 2 (12.2.0.1) and may be removed in a future release. Oracle recommends that you use the parallel statement queuing feature instead.

**See Also:**

- *Oracle Database SQL Language Reference* for more information about optimizer hints
- *Oracle Database VLDB and Partitioning Guide* for more information about parallel statement queuing

## 2.285 PARALLEL\_DEGREE\_LIMIT

`PARALLEL_DEGREE_LIMIT` limits the degree of parallelism used by the optimizer to ensure that parallel server processes do not flood the system.

| Property                   | Description                                                        |
|----------------------------|--------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                             |
| <b>Syntax</b>              | <code>PARALLEL_DEGREE_LIMIT = { CPU   AUTO   IO   integer }</code> |
| <b>Default value</b>       | CPU                                                                |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                        |
| <b>Modifiable in a PDB</b> | Yes                                                                |
| <b>Basic</b>               | No                                                                 |

With automatic degree of parallelism, Oracle automatically decides whether a statement should execute in parallel and what degree of parallelism the statement should use. The optimizer automatically determines the degree of parallelism for a statement based on the resource requirements of the statement. However, `PARALLEL_DEGREE_LIMIT` enforces the limit for the degree of parallelism used by the optimizer.

**Values**

- CPU

The maximum degree of parallelism is limited by the number of CPUs in the system. The formula used to calculate the limit is `PARALLEL_THREADS_PER_CPU * CPU_COUNT` \* the number of instances available (by default, all the opened instances on the cluster but can be constrained using `PARALLEL_INSTANCE_GROUP` or service specification). This is the default.

- AUTO

This value is equivalent to the CPU value.

- IO

The maximum degree of parallelism the optimizer can use is limited by the I/O capacity of the system. The value is calculated by dividing the total system throughput by the maximum I/O bandwidth per process. You must run the `DBMS_RESOURCE_MANAGER.CALIBRATE_IO` procedure on the system to use the IO setting. This procedure will calculate the total system throughput and the maximum I/O bandwidth per process.

- integer

A numeric value for this parameter specifies the maximum degree of parallelism the optimizer can choose for a SQL statement when automatic degree of parallelism is active. Automatic degree of parallelism is only enabled if `PARALLEL_DEGREE_POLICY` is set to `ADAPTIVE`, `AUTO`, or `LIMITED`.

#### See Also:

- *Oracle Database VLDB and Partitioning Guide* for information about automatic degree of parallelism
- *Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_RESOURCE_MANAGER.CALIBRATE_IO` procedure

## 2.286 PARALLEL\_DEGREE\_POLICY

`PARALLEL_DEGREE_POLICY` specifies whether automatic degree of parallelism, statement queuing, and in-memory parallel execution will be enabled.

| Property            | Description                                                                  |
|---------------------|------------------------------------------------------------------------------|
| Parameter type      | String                                                                       |
| Syntax              | <code>PARALLEL_DEGREE_POLICY = { MANUAL   LIMITED   AUTO   ADAPTIVE }</code> |
| Default value       | MANUAL                                                                       |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                                                  |
| Modifiable in a PDB | Yes                                                                          |
| Basic               | No                                                                           |

### Values

#### Note:

Automatic degree of parallelism will be enabled regardless of the value of `PARALLEL_DEGREE_POLICY` if a `PARALLEL` hint is used at the SQL statement level.

- MANUAL

Disables automatic degree of parallelism, statement queuing, and in-memory parallel execution. This reverts the behavior of parallel execution to what it was prior to Oracle Database 11g Release 2 (11.2). This is the default.

- LIMITED

Enables automatic degree of parallelism for some statements but statement queuing and in-memory Parallel Execution are disabled. Automatic degree of parallelism is only applied to those statements that access tables or indexes decorated explicitly with the `DEFAULT` degree of parallelism using the `PARALLEL` clause. Statements that do not access any tables or indexes decorated with the `DEFAULT` degree of parallelism will retain the `MANUAL` behavior.

- AUTO

Enables automatic degree of parallelism, statement queuing, and in-memory parallel execution.

- ADAPTIVE

This value enables automatic degree of parallelism, statement queuing and in-memory parallel execution, similar to the `AUTO` value. In addition, performance feedback is enabled. Performance feedback helps to improve the degree of parallelism automatically chosen for repeated SQL statements. After the initial execution of a statement, the degree of parallelism chosen by the optimizer is compared to the degree of parallelism computed based on the actual execution performance. If they vary significantly, then the statement is marked for re-parse and the initial execution performance statistics (for example, CPU-time) are provided as feedback for subsequent executions. The optimizer uses the initial execution performance statistics to better determine a degree of parallelism for subsequent executions.

#### See Also:

- *Oracle Database SQL Language Reference* for information about `PARALLEL` hints
- *Oracle Database VLDB and Partitioning Guide* for information about automatic degree of parallelism

## 2.287 PARALLEL\_EXECUTION\_MESSAGE\_SIZE

`PARALLEL_EXECUTION_MESSAGE_SIZE` specifies the size of messages used for parallel execution (formerly referred to as parallel query, PDML, Parallel Recovery, replication).

| Property                   | Description                                                                          |
|----------------------------|--------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Integer                                                                              |
| <b>Default value</b>       | Operating system-dependent                                                           |
| <b>Modifiable</b>          | No                                                                                   |
| <b>Modifiable in a PDB</b> | No                                                                                   |
| <b>Range of values</b>     | Minimum: 2148<br>Maximum: 65536, but some operating systems may have a smaller value |
| <b>Basic</b>               | No                                                                                   |

| Property   | Description                                  |
|------------|----------------------------------------------|
| Oracle RAC | Multiple instances must have the same value. |

On most platforms, the default value is as follows:

- 16384 bytes if `COMPATIBLE` is set to 11.2.0 or higher
- 2148 bytes if `COMPATIBLE` is less than 11.2.0

The default value is adequate for most applications. Larger values require a larger shared pool. Larger values result in better performance at the cost of higher memory use. For this reason, replication gets no benefit from increasing the size.

#### See Also:

*Oracle Database VLDB and Partitioning Guide* to learn how this parameter affects memory consumption for parallel operations, including parallel execution

## 2.288 PARALLEL\_FORCE\_LOCAL

`PARALLEL_FORCE_LOCAL` controls parallel execution in an Oracle RAC environment.

| Property            | Description                 |
|---------------------|-----------------------------|
| Parameter type      | Boolean                     |
| Default value       | false                       |
| Modifiable          | ALTER SESSION, ALTER SYSTEM |
| Modifiable in a PDB | Yes                         |
| Range of values     | true   false                |
| Basic               | No                          |

By default, the parallel server processes selected to execute a SQL statement can operate on any or all Oracle RAC nodes in the cluster. By setting `PARALLEL_FORCE_LOCAL` to `true`, the parallel server processes are restricted so that they can only operate on the same Oracle RAC node where the query coordinator resides (the node on which the SQL statement was executed).

#### See Also:

*Oracle Database VLDB and Partitioning Guide* for more information about this parameter

## 2.289 PARALLEL\_INSTANCE\_GROUP

Used in conjunction with services or with the `INSTANCE_GROUPS` parameter, `PARALLEL_INSTANCE_GROUP` lets you restrict parallel query operations to a limited number of instances.

| Property                   | Description                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                                            |
| <b>Syntax</b>              | <code>PARALLEL_INSTANCE_GROUP = service_name   group_name</code>                                                  |
| <b>Default value</b>       | There is no default value; parallel execution is enabled across all currently active instances.                   |
| <b>Modifiable</b>          | <code>ALTER SESSION, ALTER SYSTEM</code>                                                                          |
| <b>Modifiable in a PDB</b> | Yes                                                                                                               |
| <b>Range of values</b>     | Any service name or any group name specified in the <code>INSTANCE_GROUPS</code> parameter of any active instance |
| <b>Basic</b>               | No                                                                                                                |
| <b>Oracle RAC</b>          | Multiple instances can have different values.                                                                     |

`PARALLEL_INSTANCE_GROUP` is an Oracle RAC parameter that you can specify in parallel mode only. Note that the `INSTANCE_GROUPS` parameter has been deprecated.

This parameter identifies the parallel instance group Oracle will use for spawning parallel execution processes. If used in conjunction with services, then parallel operations will spawn parallel execution processes only on instances defined in the service. If used in conjunction with `INSTANCE_GROUPS`, then parallel operations will spawn parallel execution processes only on instances that specify a matching group in their `INSTANCE_GROUPS` parameter.

If the value assigned to `PARALLEL_INSTANCE_GROUP` is the name of a service or group that does not exist, then the operation runs serially. No parallelism is used.

## 2.290 PARALLEL\_MAX\_SERVERS

`PARALLEL_MAX_SERVERS` specifies the maximum number of parallel execution processes and parallel recovery processes for an instance. As demand increases, Oracle Database increases the number of processes from the number created at instance startup up to this value.

| Property                   | Description                                                                       |
|----------------------------|-----------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Integer                                                                           |
| <b>Default value</b>       | <code>PARALLEL_THREADS_PER_CPU * CPU_COUNT * concurrent_parallel_users * 5</code> |
| <b>Modifiable</b>          | <code>ALTER SYSTEM</code>                                                         |
| <b>Modifiable in a PDB</b> | Yes                                                                               |
| <b>Range of values</b>     | 0 to 32767                                                                        |
| <b>Basic</b>               | No                                                                                |
| <b>Oracle RAC</b>          | Multiple instances can have different values.                                     |

**Note:**

This parameter applies to parallel execution in exclusive mode as well as in a Real Application Clusters environment.

The number of concurrent parallel users running at default degree of parallelism on an instance depends on the memory initialization parameter settings for the instance. For example, if the `MEMORY_TARGET` or `SGA_TARGET` initialization parameter is set, then the number of `concurrent_parallel_users` = 4. If neither `MEMORY_TARGET` or `SGA_TARGET` is set, then `PGA_AGGREGATE_TARGET` is examined. If a value is set for `PGA_AGGREGATE_TARGET`, then `concurrent_parallel_users` = 2. If a value is not set for `PGA_AGGREGATE_TARGET`, then `concurrent_parallel_users` = 1.

The database system always reserves a certain number of reserved processes. Therefore, the following two values are taken into account when setting the `PARALLEL_MAX_SERVERS` initialization parameter:

- The default value of `PARALLEL_MAX_SERVERS` determined using the calculation in the table above
- The value of the `PROCESSES` initialization parameter minus the number of reserved processes

The lower of the two values is used as the default value of `PARALLEL_MAX_SERVERS`, and if you attempt to explicitly set `PARALLEL_MAX_SERVERS` to a value that is higher than either of the values, then the setting is adjusted to the lower of the two values.

When the `PARALLEL_MAX_SERVERS` parameter is set to a value lower than the value in the table above, the lower default value enables the database to start service processes and allows user processes to connect to the database.

The default value for `PARALLEL_MAX_SERVERS` for a PDB is determined using the calculation in the table above with the PDB's `CPU_COUNT` value.

**Note:**

If you set this parameter too low, then some queries may not have a parallel execution process available to them during query processing. If you set it too high, then memory resource shortages may occur during peak periods, which can degrade performance.

**See Also:**

*Oracle Database SQL Tuning Guide* for more information about parallel execution

## 2.291 PARALLEL\_MIN\_DEGREE

`PARALLEL_MIN_DEGREE` controls the minimum degree of parallelism computed by automatic degree of parallelism.

| Property            | Description                                          |
|---------------------|------------------------------------------------------|
| Parameter type      | String                                               |
| Syntax              | <code>PARALLEL_MIN_DEGREE = [ n   CPU ]</code>       |
| Default value       | 1                                                    |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                          |
| Modifiable in a PDB | Yes                                                  |
| Basic               | No                                                   |
| Oracle RAC          | A different value can be set on different instances. |

The value of `PARALLEL_MIN_DEGREE` is either a number that corresponds to the lower bound on the degree of parallelism computed by automatic degree of parallelism, or the string value `CPU`, which is computed by the function `CPU_COUNT * PARALLEL_THREADS_PER_CPU`.

The default value of `PARALLEL_MIN_DEGREE` is 1.

### Note:

`PARALLEL_MIN_DEGREE` has no impact in either of these cases:

- When the value of `PARALLEL_MIN_DEGREE` is greater than the value of `CPU_COUNT`
- When the object is Oracle-owned, such as a dictionary table or view created on a dictionary table

### See Also:

- ["PARALLEL\\_DEGREE\\_LIMIT"](#)

## 2.292 PARALLEL\_MIN\_PERCENT

`PARALLEL_MIN_PERCENT` lets you specify the minimum percentage of the requested number of parallel execution processes required for parallel execution.

| Property       | Description |
|----------------|-------------|
| Parameter type | Integer     |
| Default value  | 0           |

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Modifiable</b>          | ALTER SESSION                                 |
| <b>Modifiable in a PDB</b> | No                                            |
| <b>Range of values</b>     | 0 to 100                                      |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Multiple instances can have different values. |

This parameter controls the behavior for parallel operations when parallel statement queuing is not enabled (when `PARALLEL_DEGREE_POLICY` is set to `manual` or `limited`). It ensures that an operation always gets a minimum percentage of parallel execution servers or errors out. Setting this parameter ensures that parallel operations will not execute unless adequate resources are available. The default value of 0 means that no minimum percentage of processes has been set.

Consider the following settings:

```
PARALLEL_MIN_PERCENT = 50
PARALLEL_MIN_SERVERS = 5
PARALLEL_MAX_SERVERS = 10
```

If 8 of the 10 parallel execution processes are busy, only 2 processes are available. If you then request a query with a degree of parallelism of 8, the minimum 50% will not be met.

You can use this parameter with `PARALLEL_ADAPTIVE_MULTI_USER`. In a multi-user environment, an individual user or application can set `PARALLEL_MIN_PERCENT` to a minimum value until sufficient resources are available on the system and an acceptable degree of parallelism is returned.

## 2.293 PARALLEL\_MIN\_SERVERS

`PARALLEL_MIN_SERVERS` is the number of parallel execution processes Oracle creates when the instance is started. These processes will be kept active to service parallel statements.

| Property                   | Description                                                     |
|----------------------------|-----------------------------------------------------------------|
| <b>Parameter type</b>      | Integer                                                         |
| <b>Default value</b>       | $CPU\_COUNT * PARALLEL\_THREADS\_PER\_CPU * 2$                  |
| <b>Modifiable</b>          | ALTER SYSTEM                                                    |
| <b>Modifiable in a PDB</b> | No                                                              |
| <b>Range of values</b>     | Default value to the value of <code>PARALLEL_MAX_SERVERS</code> |
| <b>Basic</b>               | No                                                              |

| Property   | Description                                   |
|------------|-----------------------------------------------|
| Oracle RAC | Multiple instances can have different values. |

**Note:**

This parameter applies to parallel execution in exclusive mode as well as in an Oracle Real Application Clusters environment.

**Note:**

When the `PROCESSES` initialization parameter is set to a value that is lower than the documented default value for the `PARALLEL_MIN_SERVERS` parameter in the table above, the database sets the default value of `PARALLEL_MIN_SERVERS` to a value that is lower than the documented default value. The lower default value enables the database to start service processes and allows user processes to connect to the database.

**See Also:**

*Oracle Database Administrator's Guide* for more information about parallel execution servers

## 2.294 PARALLEL\_MIN\_TIME\_THRESHOLD

`PARALLEL_MIN_TIME_THRESHOLD` specifies the minimum execution time a statement should have before the statement is considered for automatic degree of parallelism.

| Property            | Description                                                   |
|---------------------|---------------------------------------------------------------|
| Parameter type      | String                                                        |
| Syntax              | <code>PARALLEL_MIN_TIME_THRESHOLD = { AUTO   integer }</code> |
| Default value       | AUTO                                                          |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                                   |
| Modifiable in a PDB | Yes                                                           |
| Basic               | No                                                            |

By default, this parameter is set to 10 seconds. Automatic degree of parallelism is only enabled if `PARALLEL_DEGREE_POLICY` is set to `ADAPTIVE`, `AUTO`, or `LIMITED`.

If all tables referenced by a SQL statement use In-Memory Column Store (IM column store), then `PARALLEL_MIN_TIME_THRESHOLD` defaults to 1.

**See Also:**

*Oracle Database VLDB and Partitioning Guide* for information about automatic degree of parallelism

## 2.295 PARALLEL\_SERVERS\_TARGET

`PARALLEL_SERVERS_TARGET` specifies the number of parallel server processes allowed to run parallel statements before statement queuing will be used.

| Property                   | Description                                                                                                                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Integer                                                                                                                                                                                                       |
| <b>Default value</b>       | For a CDB:<br>Equal to the <code>PARALLEL_MAX_SERVERS</code> value for the CDB.<br>For a PDB or non-CDB:<br>$\text{PARALLEL\_THREADS\_PER\_CPU} * \text{CPU\_COUNT} * \text{concurrent\_parallel\_users} * 2$ |
| <b>Modifiable</b>          | ALTER SYSTEM                                                                                                                                                                                                  |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                           |
| <b>Range of values</b>     | 0 to <code>PARALLEL_MAX_SERVERS</code>                                                                                                                                                                        |
| <b>Basic</b>               | No                                                                                                                                                                                                            |

When the parameter `PARALLEL_DEGREE_POLICY` is set to `ADAPTIVE` or `AUTO`, Oracle will queue SQL statements that require parallel execution, if the necessary parallel server processes are not available. In a single instance database, statement queuing will begin once the number of parallel server processes active on the system is equal to or greater than `PARALLEL_SERVERS_TARGET`. In an Oracle RAC database, a statement running on one instance can allocate parallel server processes on another instance when necessary. For example, if a statement running on one instance requires parallel execution, but the number of parallel server processes active on that instance is equal to or greater than the value of `PARALLEL_SERVERS_TARGET` for that instance, then the statement can allocate parallel server processes on a different instance. Therefore, statement queuing in an Oracle RAC database will begin only when every instance has reached its `PARALLEL_SERVER_TARGET` threshold.

**Note:**

Consumer groups that have been marked with the `PARALLEL_STMT_CRITICAL` directive set to `BYPASS_QUEUE` are allowed to bypass the parallel statement queue, and therefore may drive the total number of active parallel server processes beyond `PARALLEL_SERVERS_TARGET`. Parallel statements issued with `PARALLEL_DEGREE_POLICY` not set to `ADAPTIVE` and `AUTO` can also drive the total number of active parallel server processes beyond `PARALLEL_SERVERS_TARGET`.

By default, `PARALLEL_SERVERS_TARGET` is set lower than the maximum number of parallel server processes allowed on the system (`PARALLEL_MAX_SERVERS`) to ensure each parallel statement

will get all of the parallel server resources required and to prevent overloading the system with parallel server processes.

The number of concurrent parallel users running at default degree of parallelism on an instance depends on the memory initialization parameter settings for the instance. For example, if the `MEMORY_TARGET` or `SGA_TARGET` initialization parameter is set, then the number of `concurrent_parallel_users` = 4. If neither `MEMORY_TARGET` or `SGA_TARGET` is set, then `PGA_AGGREGATE_TARGET` is examined. If a value is set for `PGA_AGGREGATE_TARGET`, then `concurrent_parallel_users` = 2. If a value is not set for `PGA_AGGREGATE_TARGET`, then `concurrent_parallel_users` = 1.

Note that all serial (non-parallel) statements will execute immediately even if statement queuing has been activated.

By default, all PDB queries are subjected to queuing at the PDB level first by the PDB's `PARALLEL_SERVERS_TARGET` value, and then at the CDB level by the CDB's `PARALLEL_SERVERS_TARGET` value. This default behavior prevents any SQL statement inside a PDB from getting downgraded if parallel servers are exhausted in the CDB.

Parallel statement queuing is enabled by default at the CDB level because the CDB has a default value for `PARALLEL_SERVERS_TARGET`. You can disable parallel statement queuing at the CDB level by using `ALTER SYSTEM` to set `PARALLEL_SERVERS_TARGET` to 0 for the CDB.

The default value for `PARALLEL_SERVERS_TARGET` for a PDB is determined using the calculation in the table above with the PDB's `CPU_COUNT` value.

 **Note:**

A PDB can set a lower limit for parallel execution servers than the limit specified in the CDB resource plan. When the `PARALLEL_SERVERS_TARGET` initialization parameter is set in a PDB, and parallel execution server limit is specified for a PDB in the CDB resource plan, then the lower of the two limits is enforced. For example, assume that the `PARALLEL_SERVERS_TARGET` initialization parameter is set to 100 in the CDB root. Also assume that `hrpdb` has its `PARALLEL_SERVERS_TARGET` initialization parameter set to 50 and the CDB plan has a directive for `hrpdb` with `parallel_server_limit` set to 70%. In this case, the limit for parallel execution servers for `hrpdb` is 50, because 50 is lower than the CDB resource plan limit of 70 for `hrpdb`.

## 2.296 PARALLEL\_THREADS\_PER\_CPU

`PARALLEL_THREADS_PER_CPU` describes the number of parallel execution processes or threads that a CPU can handle during parallel execution.

| Property            | Description        |
|---------------------|--------------------|
| Parameter type      | Integer            |
| Default value       | 1                  |
| Modifiable          | ALTER SYSTEM       |
| Modifiable in a PDB | No                 |
| Range of values     | Any nonzero number |
| Basic               | No                 |

### Note:

This parameter applies to parallel execution in exclusive mode as well as in an Oracle Real Application Clusters environment.

This parameter is used in determining the default values of other parallel execution related parameters, for example, `PARALLEL_MAX_SERVERS`. It is also used in determining the default degree of parallelism for SQL statements, and determining the upper bound for the degree of parallelism in automatic degree of parallelism. The default value is adequate in most cases.

### See Also:

## 2.297 PDB\_FILE\_NAME\_CONVERT

`PDB_FILE_NAME_CONVERT` maps names of existing files to new file names when processing a `CREATE PLUGGABLE DATABASE` statement, as well as when processing the `ENABLE PLUGGABLE DATABASE` clause of the `CREATE DATABASE` statement, if the `file_name_convert_clause` is not specified and Oracle Managed Files is not enabled.

| Property       | Description |
|----------------|-------------|
| Parameter type | String      |

| Property                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <p>PDB_FILE_NAME_CONVERT = 'string1' , 'string2' , 'string3' , 'string4' , ...</p> <p>Where:</p> <ul style="list-style-type: none"> <li>• <i>string1</i> is the pattern of the existing filename</li> <li>• <i>string2</i> is the pattern of the new filename</li> <li>• <i>string3</i> is the pattern of the existing filename</li> <li>• <i>string4</i> is the pattern of the new filename</li> </ul> <p>You can enclose each string in single or double quotation marks.</p> <p>You can specify as many pairs of existing and new replacement strings as required.</p> <p><b>Example:</b></p> <pre>PDB_FILE_NAME_CONVERT = '/dbs/t1/', '/dbs/t1/s', 'dbs/t2/', 'dbs/t2/s'</pre> |
| <b>Default value</b>       | There is no default value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Basic</b>               | No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Oracle RAC</b>          | You must set this parameter for every instance, and multiple instances must have the same value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

File name patterns specified in this initialization parameter cannot match files or directories managed by Oracle Managed Files.

## 2.298 PDB\_LOCKDOWN

PDB\_LOCKDOWN determines the PDB lockdown profile that applies to a PDB.

| Property                   | Description                              |
|----------------------------|------------------------------------------|
| <b>Parameter type</b>      | String                                   |
| <b>Syntax</b>              | PDB_LOCKDOWN = pdb-lockdown-profile-name |
| <b>Default value</b>       | NULL                                     |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM              |
| <b>Modifiable in a PDB</b> | Yes                                      |
| <b>Basic</b>               | No                                       |
| <b>Oracle RAC</b>          | All instances should have the same value |

A PDB lockdown profile is a mechanism to restrict operations (such as setting values of certain parameters and using certain options) that can be performed by users connected to a given

PDB. You can also restrict execution of any packages that allow network access, for example, `UTL_SMTP`.

You create lockdown profiles using the SQL `CREATE LOCKDOWN PROFILE` statement. Then you can set a profile using the SQL `ALTER SESSION` or `ALTER SYSTEM` statement. See the Examples section.

This parameter can be set using the `ALTER SYSTEM` statement with scope set to `MEMORY`, `SPFILE`, or `BOTH`.

The lockdown profile for PDBs can be specified by a common user with common `ALTER SYSTEM` or common `SYSDBA` privilege.

If a PDB lockdown profile is dropped, any PDB to which the dropped profile was assigned (by means of storing the dropped profile name in the `PDB_LOCKDOWN` parameter) will continue to have its `PDB_LOCKDOWN` parameter set to the dropped lockdown profile name. However, the PDB will not have any restrictions imposed by the dropped lockdown profile.

Lockdown profiles can now be created in an application root and are referred to as application lockdown profiles.

A CDB common user with common `SYSDBA` or common `ALTER SYSTEM` privilege can only set `PDB_LOCKDOWN` to a CDB lockdown profile. Similarly, an application common user with application common `SYSDBA` or application common `ALTER SYSTEM` privilege can only set `PDB_LOCKDOWN` to an application lockdown profile.

An application common user cannot overwrite `PDB_LOCKDOWN` if `PDB_LOCKDOWN` is already set to a CDB lockdown profile in an application root or application PDB.

If the `PDB_LOCKDOWN` parameter in a PDB is set to the name of a lockdown profile different from that in its ancestor (for a CDB, the CDB root or, for application PDBs, the application root), the following will govern the interaction between restrictions imposed by these profiles:

- If the `PDB_LOCKDOWN` parameter in a PDB (including an application PDB) is set to a CDB lockdown profile, lockdown profiles specified by the `PDB_LOCKDOWN` parameter in CDB root (and for application PDBs, the application root) are ignored.
- If the `PDB_LOCKDOWN` parameter in an application PDB is set to an application lockdown profile while the `PDB_LOCKDOWN` parameter in the application root or CDB root is set to a CDB lockdown profile, in addition to the rules stipulated in the application lockdown profile, the `DISABLE` rules from the CDB lockdown profile set in its nearest ancestor (that is, an application root or CDB root) are inherited.
- If there are conflicts between rules comprising the CDB lockdown profile and the application lockdown profile, the rules in the CDB lockdown profile will take precedence (for example, the `OPTION_VALUE` clause of a CDB lockdown profile will take precedence over the `OPTION_VALUE` clause of an application lockdown profile).

## Examples

This example shows how the `SYS` user can connect to the database as `SYSDBA` and use the `CREATE LOCKDOWN PROFILE` statement in the root of a CDB to define a new lockdown profile. After defining the new lockdown profile, the `SYS` user can assign the new lockdown profile to a PDB using the `PDB_LOCKDOWN` parameter:

```
SQL> ALTER SESSION SET CONTAINER=CDB$ROOT;
```

Session altered.

```
SQL> CREATE LOCKDOWN PROFILE MYPROFILE;

Lockdown Profile created.

SQL> ALTER SESSION SET CONTAINER=CDB1_PDB1;

Session altered.

SQL> ALTER SYSTEM SET PDB_LOCKDOWN=MYPROFILE;

System altered.

SQL> SHOW PARAMETER PDB_LOCKDOWN
```

| NAME         | TYPE   | VALUE     |
|--------------|--------|-----------|
| -----        | -----  | -----     |
| pdb_lockdown | string | MYPROFILE |

```
SQL>
```

## 2.299 PDB\_OS\_CREDENTIAL

`PDB_OS_CREDENTIAL` determines the identity of the operating system user (OS user) employed when interacting with the operating system from a PDB.

| Property                   | Description                                     |
|----------------------------|-------------------------------------------------|
| <b>Parameter type</b>      | String                                          |
| <b>Syntax</b>              | <code>PDB_OS_CREDENTIAL = credential</code>     |
| <b>Default value</b>       | None                                            |
| <b>Modifiable</b>          | No                                              |
| <b>Modifiable in a PDB</b> | Yes                                             |
| <b>Basic</b>               | No                                              |
| <b>Oracle RAC</b>          | The same value should be used for all instances |

 **Note:**

The Oracle OS user will continue to be used when interacting with the operating system from the root.

The Oracle OS user is usually a highly privileged user, and using the same user for operating system interactions for every PDB is not recommended. Also, using the same OS user for operating system interactions from different PDBs may compromise data belonging to a given PDB.

In contrast, using an OS user described by a credential whose name is specified as a value of the `PDB_OS_CREDENTIAL` parameter helps ensure that operating system interactions are performed as a less powerful user and provides the ability to protect data belonging to one PDB from being accessed by users connected to another PDB. A credential is an object that is created using the `CREATE_CREDENTIAL` procedure for the `DBMS_CREDENTIAL` package.

The operating system interactions that are done as the OS user name specified in the credential include:

- External jobs that do not already have an operating system credential specified
- External table pre-processors
- PL/SQL library executions

This parameter can be specified for all the PDBs in a CDB but the CDB-wide value can be overridden for a specific PDB and can be modified *only* by a common administrative user with the `EXECUTE` privilege for the `DBMS_CREDENTIAL` PL/SQL package and the `ALTER SYSTEM` system privilege.

If a value is not set for this parameter for a given PDB, the Oracle OS User will continue to be used when interacting with the operating system from that PDB.

## 2.300 PERMIT\_92\_WRAP\_FORMAT

`PERMIT_92_WRAP_FORMAT` allows Oracle Database release 9.2 wrapped versions of PL/SQL source text to be used in Oracle Database releases 10.2 and later when this parameter is set to `true`.

| Property            | Description                                  |
|---------------------|----------------------------------------------|
| Parameter type      | Boolean                                      |
| Default value       | false                                        |
| Modifiable          | No                                           |
| Modifiable in a PDB | No                                           |
| Range of values     | true   false                                 |
| Basic               | No                                           |
| Oracle RAC          | Multiple instances should use the same value |

Oracle recommends that wrapped files be created using the PL/SQL Wrapper utility from Oracle Database release 10 or later.

## 2.301 PGA\_AGGREGATE\_LIMIT

PGA\_AGGREGATE\_LIMIT specifies a limit on the aggregate PGA memory consumed by the instance.

| Property            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | Big integer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Syntax              | PGA_AGGREGATE_LIMIT = <i>integer</i> [K   M   G]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Default value       | <p>If MEMORY_TARGET is set, then PGA_AGGREGATE_LIMIT defaults to the MEMORY_MAX_TARGET value.</p> <p>If MEMORY_TARGET is not set, then PGA_AGGREGATE_LIMIT defaults to 200% of PGA_AGGREGATE_TARGET.</p> <p>If MEMORY_TARGET is not set, and PGA_AGGREGATE_TARGET is explicitly set to 0, then the value of PGA_AGGREGATE_LIMIT is set to 90% of the physical memory size minus the total SGA size.</p> <p>In all cases, the default PGA_AGGREGATE_LIMIT is at least 2GB and at least 3MB times the PROCESSES parameter (and at least 5MB times the PROCESSES parameter for an Oracle RAC instance).</p> <p>For a PDB, the default value is the same as the CDB's default value.</p> |
| Modifiable          | ALTER SYSTEM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Modifiable in a PDB | Yes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Range of values     | <p>Do not attempt to set PGA_AGGREGATE_LIMIT below its default value, even in a parameter file (pfile), or instance startup will fail. However, PGA_AGGREGATE_LIMIT can be set to 0 either in a parameter file or dynamically after startup. If a value of 0 is specified, it means there is no limit to the aggregate PGA memory consumed by the instance.</p>                                                                                                                                                                                                                                                                                                                      |
| Basic               | No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Actions Taken When PGA\_AGGREGATE\_LIMIT is Exceeded

Parallel queries will be treated as a unit. First, the sessions that are using the most untunable memory will have their calls terminated. Then, if the total PGA memory usage is still over the limit, the sessions that are using the most untunable memory will be terminated.

SYS processes and background processes other than job queue processes will not be subjected to any of the actions described in this section. Instead, if they are using the most untunable memory, they will periodically write a brief summary of their PGA usage to a trace file.

#### Note:

This parameter is optional for pluggable databases (PDBs). When this parameter is set for a PDB, it specifies the maximum PGA size for the PDB.

To be able to use Resource Manager in a CDB to control the amount of memory each PDB can use:

- The `NONCDB_COMPATIBLE` initialization parameter must be set to `FALSE` at the CDB level (in the root of the CDB).
- The `MEMORY_TARGET` initialization parameter must not be set at the CDB level.
- You must set the `PGA_AGGREGATE_LIMIT` initialization parameter in a PDB to a value that meets these requirements:
  - Less than or equal to the `PGA_AGGREGATE_LIMIT` value set at the CDB level
  - Greater than or equal to twice the value of `PGA_AGGREGATE_TARGET` set in the PDB

When you set `PGA_AGGREGATE_LIMIT` in a PDB to a value that does not meet these requirements, you receive an error. If these requirements are violated after the PDB's parameter is set (for example, if the `PGA_AGGREGATE_LIMIT` value is changed at the CDB level), Oracle will adjust the PDB's value to meet these requirements.

## 2.302 PGA\_AGGREGATE\_TARGET

PGA\_AGGREGATE\_TARGET specifies the target aggregate PGA memory available to all server processes attached to the instance.

| Property            | Description                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | Big integer                                                                                                                       |
| Syntax              | PGA_AGGREGATE_TARGET = <i>integer</i> [K   M   G]                                                                                 |
| Default value       | 10 MB or 20% of the size of the SGA, whichever is greater<br>For a PDB, the default value is the same as the CDB's default value. |
| Modifiable          | ALTER SYSTEM                                                                                                                      |
| Modifiable in a PDB | Yes                                                                                                                               |
| Range of values     | Minimum: 10 MB<br>Maximum: 4096 GB - 1                                                                                            |
| Basic               | Yes                                                                                                                               |

To set a hard limit for aggregate PGA memory, use the PGA\_AGGREGATE\_LIMIT parameter.

Setting PGA\_AGGREGATE\_TARGET to a nonzero value has the effect of automatically setting the WORKAREA\_SIZE\_POLICY parameter to AUTO. With this setting, SQL working areas used by memory-intensive SQL operators (such as sort, group-by, hash-join, bitmap merge, and bitmap create) will be automatically sized. A nonzero value for this parameter is the default since, unless you specify otherwise, Oracle sets it to 20% of the SGA or 10 MB, whichever is greater.

Setting PGA\_AGGREGATE\_TARGET to 0 automatically sets the WORKAREA\_SIZE\_POLICY parameter to MANUAL. With this setting, SQL working areas are sized using the \*\_AREA\_SIZE parameters.

Oracle attempts to keep the amount of private memory below the target specified by this parameter by adapting the size of the working areas to private memory. When increasing the value of this parameter, you indirectly increase the memory allotted to working areas. Consequently, more memory-intensive operations are able to run fully in memory and fewer will work their way over to disk.

If Automatic Memory Management is enabled (MEMORY\_TARGET is set to a positive value) and PGA\_AGGREGATE\_TARGET is also set to a positive value, the PGA\_AGGREGATE\_TARGET value acts as the minimum value for the size of the instance PGA.

 **Note:**

This parameter is optional for pluggable databases (PDBs). When this parameter is set for a PDB, it specifies the target aggregate PGA size for the PDB.

To be able to use Resource Manager in a CDB to control the amount of memory each PDB can use:

- The `NONCDB_COMPATIBLE` initialization parameter must be set to `FALSE` at the CDB level (in the root of the CDB).
- The `MEMORY_TARGET` initialization parameter must not be set at the CDB level.
- You must set the `PGA_AGGREGATE_TARGET` initialization parameter in a PDB to a value that meets these requirements:
  - Less than or equal to the `PGA_AGGREGATE_TARGET` value set at the CDB level
  - Less than or equal to 50% of the `PGA_AGGREGATE_LIMIT` initialization parameter value set at the CDB level
  - Less than or equal to 50% of the `PGA_AGGREGATE_LIMIT` value set in the PDB

When you set `PGA_AGGREGATE_TARGET` in a PDB to a value that does not meet these requirements, you receive an error. If these requirements are violated after the PDB's parameter is set (for example, if the `PGA_AGGREGATE_TARGET` value is changed at the CDB level), Oracle will adjust the PDB's value to meet these requirements.

## 2.303 PKCS11\_LIBRARY\_LOCATION

`PKCS11_LIBRARY_LOCATION` specifies the PKCS#11 library location for Transparent Data Encryption (TDE).

| Property            | Description                                               |
|---------------------|-----------------------------------------------------------|
| Parameter type      | String                                                    |
| Syntax              | <code>PKCS11_LIBRARY_LOCATION = 'library_location'</code> |
| Default value       | None                                                      |
| Modifiable          | <code>ALTER SYSTEM</code>                                 |
| Modifiable in a PDB | Yes                                                       |
| Basic               | No                                                        |
| Oracle RAC          | The same value must be used on all instances.             |

For *library\_location*, specify the full operating system path to the PKCS#11 library. For example:

```
ALTER SYSTEM SET PKCS11_LIBRARY_LOCATION =
 '/opt/oracle/extapi/64/pkcs11/okv/21.8/liborapkcs.so';
```

## 2.304 PLSCOPE\_SETTINGS

PLSCOPE\_SETTINGS controls the compile time collection, cross-reference, and storage of PL/SQL source code identifier data.

| Property                   | Description                                                                                                                                                                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                                                                                                                                                                  |
| <b>Syntax</b>              | <code>PLSCOPE_SETTINGS = 'value_clause [, value_clause ]'</code><br><b>value_clause::=</b><br>{ IDENTIFIERS   STATEMENTS } : { ALL   NONE   PUBLIC (for IDENTIFIERS only)   SQL (for IDENTIFIERS only)   PLSQL (for IDENTIFIERS only) } |
| <b>Default value</b>       | <code>'IDENTIFIERS:NONE'</code>                                                                                                                                                                                                         |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                                                                                                                                                                                             |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                                                     |
| <b>Basic</b>               | No                                                                                                                                                                                                                                      |

### Values

- `IDENTIFIERS:ALL`  
Enables the collection of all source code identifier data.
- `IDENTIFIERS:NONE`  
Disables the collection of all source code identifier data.
- `IDENTIFIERS: PUBLIC`  
Enables the collection of all PUBLIC user identifier data (except for DEFINITION)
- `IDENTIFIERS:SQL`  
Enables the collection of all SQL identifier data.
- `IDENTIFIERS:PLSQL`  
Enables the collection of all PLSQL identifier data.
- `STATEMENTS:ALL`  
Enables the collection of all SQL statements used in PL/SQL.
- `STATEMENTS:NONE`

Disables the collection of all statements.

PLSCOPE\_SETTINGS can be set on a session, system, or per-library unit (ALTER COMPILER) basis. The current setting of PLSCOPE\_SETTINGS for any library unit can be attained by querying the \*\_PLSQL\_OBJECT\_SETTINGS views. Any identifier data collected by setting this parameter can be accessed using the \*\_IDENTIFIERS views.

When a STATEMENTS setting is not specified, and IDENTIFIERS is specified but set to a value other than NONE, STATEMENTS defaults to a setting of ALL, which is equal to:

```
IDENTIFIERS: [ALL|PLSQL|PLSQL|PUBLIC]
```

### Examples

The following parameter setting causes PL/SQL and SQL identifiers and statements to be collected:

```
PLSCOPE_SETTINGS = 'IDENTIFIERS:ALL, STATEMENTS:ALL'
```

The following parameter setting causes only SQL identifiers and statements to be collected:

```
PLSCOPE_SETTINGS = 'IDENTIFIERS:SQL, STATEMENTS:ALL'
```

The following parameter setting causes only PL/SQL identifiers to be collected:

```
PLSCOPE_SETTINGS = 'IDENTIFIERS:PLSQL, STATEMENTS:NONE'
```

The following parameter setting causes no identifier data to be collected, and drops any existing identifier data:

```
PLSCOPE_SETTINGS = 'IDENTIFIERS: NONE'
```

## 2.305 PLSQL\_CCFLAGS

PLSQL\_CCFLAGS provides a mechanism that allows PL/SQL programmers to control conditional compilation of each PL/SQL library unit independently.

| Property       | Description |
|----------------|-------------|
| Parameter type | String      |

| Property                   | Description                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | PLSQL_CCFLAGS = '<v1>:<c1>,<v2>:<c2>,...,<vn>:<cn>'                                                |
| <b>Default value</b>       | Empty string                                                                                       |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                                                        |
| <b>Modifiable in a PDB</b> | Yes                                                                                                |
| <b>Range of values</b>     | Any string literal that satisfies the internal syntax                                              |
| <b>Basic</b>               | No                                                                                                 |
| <b>Examples</b>            | ALTER SESSION SET PLSQL_CCFLAGS = 'DeBug:True';<br>ALTER SESSION SET PLSQL_CCFLAGS = 'debug:TRUE'; |

### Values

- <vi> has the form of an unquoted PL/SQL identifier. It is unrestricted and can be a reserved word or a keyword. The text is insensitive to case. Each one is known as a flag or flag name. Each <vi> can occur more than once in the string, each occurrence can have a different flag value, and the flag values can be of different kinds.
- <ci> is one of the following: a PL/SQL boolean literal, a PLS\_INTEGER literal, or the literal NULL. The text is insensitive to case. Each one is known as a flag value and corresponds to a flag name.

You can define any allowable value for PLSQL\_CCFLAGS. However, Oracle recommends that this parameter be used for controlling the conditional compilation of debugging or tracing code. It is recommended that the following identifiers not be used as flag name values:

- Names of Oracle parameters (for example, NLS\_LENGTH\_SEMANTICS)
- Identifiers with any of the following prefixes: PLS\_, PLSQL\_, PLSCC\_, ORA\_, ORACLE\_, DBMS\_, SYS\_

### See Also:

*Oracle Database PL/SQL Language Reference* for more information about this parameter

## 2.306 PLSQL\_CODE\_TYPE

PLSQL\_CODE\_TYPE specifies the compilation mode for PL/SQL library units.

| Property                   | Description                                |
|----------------------------|--------------------------------------------|
| <b>Parameter type</b>      | String                                     |
| <b>Syntax</b>              | PLSQL_CODE_TYPE = { INTERPRETED   NATIVE } |
| <b>Default value</b>       | INTERPRETED                                |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                |
| <b>Modifiable in a PDB</b> | Yes                                        |
| <b>Basic</b>               | No                                         |

### Values

- INTERPRETED

PL/SQL library units will be compiled to PL/SQL bytecode format. Such modules are executed by the PL/SQL interpreter engine.

- NATIVE

PL/SQL library units (with the possible exception of top-level anonymous PL/SQL blocks) will be compiled to native (machine) code. Such modules will be executed natively without incurring any interpreter overhead.

When the value of this parameter is changed, it has no effect on PL/SQL library units that have already been compiled. The value of this parameter is stored persistently with each library unit.

If a PL/SQL library unit is compiled native, all subsequent automatic recompilations of that library unit will use native compilation.

#### See Also:

*Oracle Database PL/SQL Language Reference* for more information about this parameter

## 2.307 PLSQL\_DEBUG

PLSQL\_DEBUG specifies whether or not PL/SQL library units will be compiled for debugging.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Boolean                     |
| <b>Default value</b>       | false                       |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | true   false                |
| <b>Basic</b>               | No                          |

#### Note:

The PLSQL\_DEBUG parameter is deprecated. It is retained for backward compatibility only.

### Values

- true

PL/SQL library units will be compiled for debugging

- false

PL/SQL library units will be compiled for normal execution

When `PLSQL_DEBUG` is set to `true`, PL/SQL library units are always compiled `INTERPRETED` in order to be debuggable.

When the value of this parameter is changed, it has no effect on PL/SQL library units that have already been compiled. The value of this parameter is stored persistently with each library unit.

## 2.308 PLSQL\_IMPLICIT\_CONVERSION\_BOOL

`PLSQL_IMPLICIT_CONVERSION_BOOL` allows or disallows implicit conversions in PL/SQL between numeric data types and the `BOOLEAN` data type, and between character data types and the `BOOLEAN` data type.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Boolean                     |
| <b>Default value</b>       | false                       |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | true   false                |
| <b>Basic</b>               | No                          |

When this parameter is set to `true`, PL/SQL supports the following implicit data type conversions:

- Numeric data type to `BOOLEAN` data type
  - Non-zero numeric values are implicitly converted to the `BOOLEAN` value `TRUE`
  - The numeric value of 0 is implicitly converted to the `BOOLEAN` value `FALSE`
- Character data type to `BOOLEAN` data type
  - Character values such as 'true', 't', 'yes', 'y', '1', and 'on' (case-insensitive) are implicitly converted to the `BOOLEAN` value `TRUE`
  - Character values such as 'false', 'f', 'no', 'n', '0', and 'off' (case-insensitive) are implicitly converted to the `BOOLEAN` value `FALSE`
- `BOOLEAN` data type to numeric data type
  - The `BOOLEAN` value `TRUE` is implicitly converted to the numeric value 1
  - The `BOOLEAN` value `FALSE` is implicitly converted to the numeric value 0
- `BOOLEAN` data type to character data type
  - The `BOOLEAN` value `TRUE` is implicitly converted to the character value 'TRUE'
  - The `BOOLEAN` value `FALSE` is implicitly converted to the character value 'FALSE'

When this parameter is set to `false`, PL/SQL does not support such implicit conversions.

### Note:

This parameter is available starting with Oracle Database 23ai.

## 2.309 PLSQL\_OPTIMIZE\_LEVEL

`PLSQL_OPTIMIZE_LEVEL` specifies the optimization level that will be used to compile PL/SQL library units. The higher the setting of this parameter, the more effort the compiler makes to optimize PL/SQL library units.

| Property            | Description                 |
|---------------------|-----------------------------|
| Parameter type      | Integer                     |
| Default value       | 2                           |
| Modifiable          | ALTER SESSION, ALTER SYSTEM |
| Modifiable in a PDB | Yes                         |
| Range of values     | 0 to 3                      |
| Basic               | No                          |

### Values

- 0  
Maintains the evaluation order and hence the pattern of side effects, exceptions, and package initializations of Oracle9i and earlier releases. Also removes the new semantic identity of `BINARY_INTEGER` and `PLS_INTEGER` and restores the earlier rules for the evaluation of integer expressions. Although code will run somewhat faster than it did in Oracle9i, use of level 0 will forfeit most of the performance gains of PL/SQL in Oracle Database 10g.
- 1  
Applies a wide range of optimizations to PL/SQL programs including the elimination of unnecessary computations and exceptions, but generally does not move source code out of its original source order.
- 2  
Applies a wide range of modern optimization techniques beyond those of level 1 including changes which may move source code relatively far from its original location.
- 3  
Applies a wide range of optimization techniques beyond those of level 2, automatically including techniques not specifically requested.

Generally, setting this parameter to 2 pays off in better execution performance. If, however, the compiler runs slowly on a particular source module or if optimization does not make sense for some reason (for example, during rapid turnaround development), then setting this parameter to 1 will result in almost as good a compilation with less use of compile-time resources.

The value of this parameter is stored persistently with the library unit.

 **See Also:**

- *Oracle Database PL/SQL Language Reference* for more information about this parameter
- *Oracle Database Development Guide* for an example of using this parameter

## 2.310 PLSQL\_V2\_COMPATIBILITY

PLSQL\_V2\_COMPATIBILITY is used to specify whether nonstandard behavior that PL/SQL Version 2 allows will be allowed in PL/SQL Version 8.

| Property            | Description                 |
|---------------------|-----------------------------|
| Parameter type      | Boolean                     |
| Default value       | false                       |
| Modifiable          | ALTER SESSION, ALTER SYSTEM |
| Modifiable in a PDB | Yes                         |
| Range of values     | true   false                |
| Basic               | No                          |

 **Note:**

The PLSQL\_V2\_COMPATIBILITY parameter is deprecated. It is retained for backward compatibility only.

PL/SQL Version 2 allows some nonstandard behavior that Version 8 disallows. If you want to retain that behavior for backward compatibility, set PLSQL\_V2\_COMPATIBILITY to true. If you set it to false, then PL/SQL Version 8 behavior is enforced and Version 2 behavior is not allowed.

 **See Also:**

*Oracle Database PL/SQL Language Reference* for a description of the differences between PL/SQL Version 2 and Version 8, and for more information on setting this parameter

## 2.311 PLSQL\_WARNINGS

PLSQL\_WARNINGS enables or disables the reporting of warning messages by the PL/SQL compiler, and specifies which warning messages to show as errors.

| Property       | Description |
|----------------|-------------|
| Parameter type | String      |

| Property                   | Description                                                                                                                                                                                                                               |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | PLSQL_WARNINGS = 'value_clause' [, 'value_clause' ] ...                                                                                                                                                                                   |
| <b>Syntax</b>              | <b>value_clause::=</b><br>{ ENABLE   DISABLE   ERROR }:<br>{ ALL<br>  SEVERE<br>  INFORMATIONAL<br>  PERFORMANCE<br>  { integer<br>  (integer [, integer ] ...)<br>}<br>}                                                                 |
| <b>Default value</b>       | 'DISABLE:ALL'                                                                                                                                                                                                                             |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                                                                                                                                                                                               |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                                                       |
| <b>Basic</b>               | No                                                                                                                                                                                                                                        |
| <b>Examples</b>            | PLSQL_WARNINGS = 'ENABLE:SEVERE', 'DISABLE:INFORMATIONAL';<br>PLSQL_WARNINGS = 'DISABLE:ALL';<br>PLSQL_WARNINGS = 'DISABLE:5000', 'ENABLE:5001', 'ERROR:5002';<br>PLSQL_WARNINGS = 'ENABLE: (5000,5001,5002)', 'DISABLE:<br>(6000,6001)'; |

### value\_clause

Multiple value clauses may be specified, enclosed in quotes and separated by commas. Each value clause is composed of a qualifier, a colon (:), and a modifier.

#### Qualifier values:

- **ENABLE**  
Enable a specific warning or a set of warnings
- **DISABLE**  
Disable a specific warning or a set of warnings
- **ERROR**  
Treat a specific warning or a set of warnings as errors

#### Modifier values:

- **ALL**  
Apply the qualifier to all warning messages
- **SEVERE**  
Apply the qualifier to only those warning messages in the **SEVERE** category
- **INFORMATIONAL**  
Apply the qualifier to only those warning messages in the **INFORMATIONAL** category
- **PERFORMANCE**

Apply the qualifier to only those warning messages in the `PERFORMANCE` category

 **See Also:**

*Oracle Database PL/SQL Language Reference* for more information about this parameter

## 2.312 PMEM\_FILESTORE

`PMEM_FILESTORE` specifies the Persistent Memory Filestores (PMEM Filestores) that the database automatically mounts during instance startup.

| Property                   | Description                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                                |
| <b>Syntax</b>              | <code>PMEM_FILESTORE = ( 'mount_point', 'backing_file' [, 'mount_point', 'backing_file' ]... )</code> |
| <b>Default value</b>       | None                                                                                                  |
| <b>Modifiable</b>          | No                                                                                                    |
| <b>Modifiable in a PDB</b> | No                                                                                                    |
| <b>Basic</b>               | No                                                                                                    |

You can specify one or more PMEM Filestores to be mounted during instance startup.

Specify the following pair of values for each PMEM Filestore:

- `mount_point`: The operating system directory path for the mount point of the PMEM Filestore
- `backing_file`: The operating system file path for the backing file of the PMEM Filestore

For example:

```
PMEM_FILESTORE=('/var/db/db_1', '/var/db_storage/db1.f')
```

```
PMEM_FILESTORE=('/var/db/db_1', '/var/db_storage/db1.f', '/var/db/db_2',
'/var/db_storage/db2.f')
```

## 2.313 PRE\_PAGE\_SGA

`PRE_PAGE_SGA` determines whether Oracle accesses the entire SGA at instance startup.

Operating system page table entries are then prebuilt for each page of the SGA.

| Property                   | Description |
|----------------------------|-------------|
| <b>Parameter type</b>      | Boolean     |
| <b>Default value</b>       | true        |
| <b>Modifiable</b>          | No          |
| <b>Modifiable in a PDB</b> | No          |

| Property        | Description  |
|-----------------|--------------|
| Range of values | true   false |
| Basic           | No           |

When this parameter is set to `true`, the database server touches the entire SGA after the instance startup. These accesses are done by a background process and are initiated after the instance startup. The accesses cause the OS to allocate memory to the SGA and populate the page tables, making the SGA memory resident and increasing database performance.

**Note:**

This setting does not prevent your operating system from paging or swapping the SGA after it is initially read into memory.

**Note:**

The `PRE_PAGE_SGA` parameter is deprecated in Oracle Database 23ai because it is obsolete. Setting this parameter typically provides little or no potential performance benefits, and can create problems.

The Oracle Database design for SGA packaging has evolved over time, so that process start-up effects on the SGA are initiated after instance startup, and there is little to no benefit in changing the value for `PRE_PAGE_SGA`. The only use case for this parameter is on Oracle Exadata systems, which should have `PRE_PAGE_SGA` set to `TRUE`.

## 2.314 PRIORITY\_TXNS\_HIGH\_WAIT\_TARGET

`PRIORITY_TXNS_HIGH_WAIT_TARGET` specifies the maximum number of seconds that a `HIGH` priority transaction will wait for a row lock before the Priority Transactions feature rolls back a lower priority transaction holding the lock.

| Property            | Description                                   |
|---------------------|-----------------------------------------------|
| Parameter type      | Integer                                       |
| Default value       | 2147483647                                    |
| Modifiable          | ALTER SYSTEM                                  |
| Modifiable in a PDB | Yes                                           |
| Range of values     | 1 to 2147483647                               |
| Basic               | No                                            |
| Oracle RAC          | Different instances can use different values. |

The Priority Transactions feature automatically rolls back low-priority transactions that are blocking higher priority transactions from obtaining row locks.

This parameter is one of four initialization parameters that enable you to configure Priority Transactions. The other parameters are:

- `TXN_PRIORITY` - Specifies a priority (`HIGH`, `MEDIUM`, or `LOW`) for all transactions in a user session
- `PRIORITY_TXNS_MEDIUM_WAIT_TARGET` - Specifies the maximum number of seconds that a `MEDIUM` priority transaction will wait for a row lock
- `PRIORITY_TXNS_MODE` - Specifies whether to enable Priority Transactions or test Priority Transactions by running in tracking mode

#### Note:

This parameter is available starting with Oracle Database 23ai.

#### See Also:

- `"TXN_PRIORITY"`
- `"PRIORITY_TXNS_MEDIUM_WAIT_TARGET"`
- `"PRIORITY_TXNS_MODE"`
- *Oracle Database Administrator's Guide* for more information about Priority Transactions

## 2.315 PRIORITY\_TXNS\_MEDIUM\_WAIT\_TARGET

`PRIORITY_TXNS_MEDIUM_WAIT_TARGET` specifies the maximum number of seconds that a `MEDIUM` priority transaction will wait for a row lock before the Priority Transactions feature rolls back a lower priority transaction holding the lock.

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Parameter type</b>      | Integer                                       |
| <b>Default value</b>       | 2147483647                                    |
| <b>Modifiable</b>          | ALTER SYSTEM                                  |
| <b>Modifiable in a PDB</b> | Yes                                           |
| <b>Range of values</b>     | 1 to 2147483647                               |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Different instances can use different values. |

The Priority Transactions feature automatically rolls back low-priority transactions that are blocking higher priority transactions from obtaining row locks.

This parameter is one of four initialization parameters that enable you to configure Priority Transactions. The other parameters are:

- `TXN_PRIORITY` - Specifies a priority (`HIGH`, `MEDIUM`, or `LOW`) for all transactions in a user session

- `PRIORITY_TXNS_HIGH_WAIT_TARGET` - Specifies the maximum number of seconds that a **HIGH** priority transaction will wait for a row lock
- `PRIORITY_TXNS_MODE` - Specifies whether to enable Priority Transactions or test Priority Transactions by running in tracking mode

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

- `"TXN_PRIORITY"`
- `"PRIORITY_TXNS_HIGH_WAIT_TARGET"`
- `"PRIORITY_TXNS_MODE"`
- *Oracle Database Administrator's Guide* for more information about Priority Transactions

## 2.316 PRIORITY\_TXNS\_MODE

`PRIORITY_TXNS_MODE` specifies the mode for Priority Transactions.

| Property                   | Description                                            |
|----------------------------|--------------------------------------------------------|
| <b>Parameter type</b>      | String                                                 |
| <b>Syntax</b>              | <code>PRIORITY_TXNS_MODE = { ROLLBACK   TRACK }</code> |
| <b>Default value</b>       | ROLLBACK                                               |
| <b>Modifiable</b>          | ALTER SYSTEM                                           |
| <b>Modifiable in a PDB</b> | Yes                                                    |
| <b>Basic</b>               | No                                                     |
| <b>Oracle RAC</b>          | Multiple instances must have the same value.           |

**Values:**

- **ROLLBACK** - This setting enables Priority Transactions. The database will automatically roll back low-priority transactions that are blocking higher priority transactions from obtaining row locks.

Before enabling Priority Transactions, ensure that the following initialization parameters are configured properly:

- `PRIORITY_TXNS_HIGH_WAIT_TARGET` - Specifies the maximum number of seconds that a **HIGH** priority transaction will wait for a row lock
- `PRIORITY_TXNS_MEDIUM_WAIT_TARGET` - Specifies the maximum number of seconds that a **MEDIUM** priority transaction will wait for a row lock

- `TXN_PRIORITY` - Specifies a priority (`HIGH`, `MEDIUM`, or `LOW`) for all transactions in a user session

When running in `ROLLBACK` mode, you can track the performance of Priority Transactions by monitoring the following statistics:

- `txns rollback priority_txns_high_wait_target`
- `txns rollback priority_txns_medium_wait_target`
- `TRACK` - This setting allows you to track the potential behavior of Priority Transactions. You can use this mode to tune the Priority Transactions initialization parameters before enabling `ROLLBACK` mode.

The database determines when `HIGH` and `MEDIUM` priority transactions would be rolled back, given the current values of the Priority Transactions initialization parameters. However, instead of actually rolling back the transactions, the database only increments the following statistics:

- `txns track mode priority_txns_high_wait_target`
- `txns track mode priority_txns_medium_wait_target`

You can also monitor the following wait events to determine the amount of time transactions are waiting for row locks:

- `enq: TX - row lock (HIGH priority)`
- `enq: TX - row lock (MEDIUM priority)`
- `enq: TX - row lock (LOW priority)`

**Note:**

This parameter is available starting with Oracle Database 23ai.

## 2.317 PRIVATE\_TEMP\_TABLE\_PREFIX

`PRIVATE_TEMP_TABLE_PREFIX` specifies the prefix that the database uses for private temporary tables.

| Property       | Description |
|----------------|-------------|
| Parameter type | String      |

| Property                   | Description                                        |
|----------------------------|----------------------------------------------------|
| <b>Syntax</b>              | <code>PRIVATE_TEMP_TABLE_PREFIX = string</code>    |
| <b>Default value</b>       | <code>ORA\$PTT_</code>                             |
| <b>Modifiable</b>          | <code>ALTER SYSTEM ... DEFERRED</code>             |
| <b>Modifiable in a PDB</b> | Yes                                                |
| <b>Basic</b>               | No                                                 |
| <b>Oracle RAC</b>          | The same value must be specified on each instance. |

The default value used for the `PRIVATE_TEMP_TABLE_PREFIX` parameter is `ORA$PTT_`.

If you choose to specify a different prefix value, it must begin with the string `ORA$` and must be unique across the database. Use the following SQL query to determine if the prefix value is unique (in the query, replace `prefix-value` with your actual prefix value):

```
select count(*) from obj$ where name like '<prefix-value>%';
```

If the above query returns 0, then the prefix you specified is an appropriate value to set.

#### Note:

After setting the prefix, regular table, view, and object names cannot use the same prefix.

## 2.318 PROCESSES

`PROCESSES` specifies the maximum number of operating system user processes that can simultaneously connect to Oracle.

| Property                   | Description                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Integer                                                                                          |
| <b>Default value</b>       | The value is derived, and it typically depends on the number of cores reported in the alert log. |
| <b>Modifiable</b>          | No                                                                                               |
| <b>Modifiable in a PDB</b> | No                                                                                               |
| <b>Range of values</b>     | 6 to operating system dependent                                                                  |

| Property   | Description                                   |
|------------|-----------------------------------------------|
| Basic      | Yes                                           |
| Oracle RAC | Multiple instances can have different values. |

The value for this parameter should allow for all background processes such as locks, job queue processes, and parallel execution processes.

The default values of the `SESSIONS` and `TRANSACTIONS` parameters are derived from this parameter. Therefore, if you change the value of `PROCESSES`, you should evaluate whether to adjust the values of those derived parameters.

#### See Also:

- Your operating system-specific Oracle documentation for the range of values
- *Oracle Database Concepts* for an introduction to Oracle database instance processes

## 2.319 PROCESSOR\_GROUP\_NAME

`PROCESSOR_GROUP_NAME` specifies the name of the processor group that this instance should run in.

| Property            | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | String                                                                                                                                                                                                                                                                                                                                                                   |
| Syntax              | <code>PROCESSOR_GROUP_NAME = string</code>                                                                                                                                                                                                                                                                                                                               |
| Default value       | There is no default value                                                                                                                                                                                                                                                                                                                                                |
| Modifiable          | No                                                                                                                                                                                                                                                                                                                                                                       |
| Modifiable in a PDB | No                                                                                                                                                                                                                                                                                                                                                                       |
| Basic               | No                                                                                                                                                                                                                                                                                                                                                                       |
| Oracle RAC          | For Oracle RAC databases, it is recommended that the operating system processor groups for each database instance are all named the same, so that the same <code>PROCESSOR_GROUP_NAME</code> value can be used. However, you can choose to use different names. In this case, you would set the <code>PROCESSOR_GROUP_NAME</code> explicitly for each database instance. |

This initialization parameter is supported on the Linux and Solaris operating systems.

`PROCESSOR_GROUP_NAME` instructs the database instance to run itself within the specified operating system processor group. All Oracle processes will be bound to the CPUs in this group and will only run on these CPUs.

 **Notes:**

- Oracle recommends that this parameter be set only for databases on which the `USE_DEDICATED_BROKER` initialization parameter is also set to `TRUE`.
- For NUMA systems, all SGA and PGA memory allocated by the database instance will be allocated from NUMA nodes within the group.
- Starting with Oracle Database Appliance (ODA) release 19.9, you can use `PROCESSOR_GROUP_NAME` to specify the set of CPU cores on which the database on ODA will run. For more information, refer to *Oracle Database Appliance X8-2 Deployment and User's Guide*.

 **See Also:**

"[USE\\_DEDICATED\\_BROKER](#)"

## 2.320 QUERY\_REWRITE\_ENABLED

Use `QUERY_REWRITE_ENABLED` to enable or disable query rewriting globally for the database.

| Property            | Description                                                                                                                                                                                 |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | String                                                                                                                                                                                      |
| Syntax              | <code>QUERY_REWRITE_ENABLED = { false   true   force }</code>                                                                                                                               |
| Default value       | If <code>OPTIMIZER_FEATURES_ENABLE</code> is set to 10.0.0 or higher, then <code>true</code><br>If <code>OPTIMIZER_FEATURES_ENABLE</code> is set to 9.2.0 or lower, then <code>false</code> |
| Modifiable          | <code>ALTER SESSION</code> , <code>ALTER SYSTEM</code>                                                                                                                                      |
| Modifiable in a PDB | Yes                                                                                                                                                                                         |
| Basic               | No                                                                                                                                                                                          |
| Oracle RAC          | Multiple instances can have different values.                                                                                                                                               |

### Values

- `false`  
Oracle does not use rewrite.
- `true`  
Oracle costs the query with rewrite and without rewrite and chooses the method with the lower cost.
- `force`  
Oracle always uses rewrite and does not evaluate the cost before doing so. Use `force` when you know that the query will always benefit from rewrite and when reduction in compile time is important.

To take advantage of query rewrite for a particular materialized view, you must enable query rewrite for that materialized view, and you must enable cost-based optimization.

 **See Also:**

- *Oracle Database Data Warehousing Guide* for information on query rewrite of materialized views
- *Oracle Database SQL Tuning Guide* and "[OPTIMIZER\\_MODE](#)" for information on cost-based optimization

## 2.321 QUERY\_REWRITE\_INTEGRITY

`QUERY_REWRITE_INTEGRITY` determines the degree to which Oracle must enforce query rewriting. At the safest level, Oracle does not use query rewrite transformations that rely on unenforced relationships.

| Property                   | Description                                                                     |
|----------------------------|---------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                          |
| <b>Syntax</b>              | <code>QUERY_REWRITE_INTEGRITY = { enforced   trusted   stale_tolerated }</code> |
| <b>Default value</b>       | <code>enforced</code>                                                           |
| <b>Modifiable</b>          | <code>ALTER SESSION, ALTER SYSTEM</code>                                        |
| <b>Modifiable in a PDB</b> | Yes                                                                             |
| <b>Basic</b>               | No                                                                              |
| <b>Oracle RAC</b>          | Multiple instances can have different values.                                   |

`QUERY_REWRITE_INTEGRITY` is relevant for materialized views as well as for foreign key constraints in `NOVALIDATE` state.

### Values

- `enforced`  
Oracle enforces and guarantees consistency and integrity.
- `trusted`  
Oracle allows rewrites using relationships that have been declared, but that are not enforced by Oracle.
- `stale_tolerated`  
Oracle allows rewrites using unenforced relationships. Materialized views are eligible for rewrite even if they are known to be inconsistent with the underlying detail data. You must set the `QUERY_REWRITE_INTEGRITY` initialization parameter to `stale_tolerated` before querying an external table in the In-Memory Column Store (IM column store).

If a foreign key constraint is in `NOVALIDATE` state, join elimination is not done when `QUERY_REWRITE_INTEGRITY=enforced`. This means that queries with joins over a foreign key constraint that is in `RELY NOVALIDATE` state can potentially take longer to parse and execute as the optimizer does not trust the `RELY`.

 **See Also:**

- `"INMEMORY_CLAUSE_DEFAULT"`
- *Oracle Database Data Warehousing Guide* for more information about query rewrite for materialized views
- *Oracle Database Data Warehousing Guide* for more information about the `QUERY_REWRITE_INTEGRITY` parameter

## 2.322 RDBMS\_SERVER\_DN

`RDBMS_SERVER_DN` specifies the Distinguished Name (DN) of the Oracle server. It is used for retrieving Enterprise Roles from an enterprise directory service.

 **Note:**

Enterprise User Security (EUS) is deprecated with Oracle Database 23ai.

Oracle recommends that you migrate to using Centrally Managed Users (CMU). This feature enables you to directly connect with Microsoft Active Directory without an intervening directory service for enterprise user authentication and authorization to the database. If your Oracle Database is in the cloud, you can also choose to move to one of the newer integrations with a cloud identity provider.

| Property                   | Description                                |
|----------------------------|--------------------------------------------|
| <b>Parameter type</b>      | X.500 Distinguished Name                   |
| <b>Default value</b>       | There is no default value.                 |
| <b>Modifiable</b>          | No                                         |
| <b>Modifiable in a PDB</b> | No                                         |
| <b>Range of values</b>     | All X.500 Distinguished Name format values |
| <b>Basic</b>               | No                                         |

 **Note:**

The `RDBMS_SERVER_DN` parameter is deprecated in Oracle Database 12c Release 1 (12.1.0.2). It is replaced by the `LDAP_DIRECTORY_ACCESS` initialization parameter.

If you do not want to use a directory for enterprise user and privilege management, but prefer to use SSL authentication alone, do not set this parameter.

 **See Also:**

- *Oracle Database Enterprise User Security Administrator's Guide* for more information on enterprise roles and the enterprise directory service
- ["LDAP\\_DIRECTORY\\_ACCESS"](#)

## 2.323 READ\_ONLY

`READ_ONLY` enables or disables read-only mode for a user session.

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Parameter type</b>      | Boolean                                       |
| <b>Default value</b>       | false                                         |
| <b>Modifiable</b>          | ALTER SESSION                                 |
| <b>Modifiable in a PDB</b> | No                                            |
| <b>Range of values</b>     | true   false                                  |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Different instances can use different values. |

The `READ_ONLY` parameter allows you to prohibit write operations in a user session, without having to put an entire CDB or container into read-only mode. You can set this parameter in a session created by any type of user, such as a CDB common user, an application common user, or a local user. This parameter is effective in any type of container, such as the CDB root, a PDB, an application root, or an application PDB, when the container is open in read/write mode.

- To enable read-only mode for the current session, set the `READ_ONLY` parameter to `true`. You cannot set this parameter to `true` when there are active transactions in the session.
- To disable read-only mode for the current session, set the `READ_ONLY` parameter to `false`.

The `READ_ONLY` parameter value for a user session does not affect the value of the `OPEN_MODE` column for the session's container, as displayed in views such as `V$CONTAINER_TOPOLOGY`, `V$CONTAINERS`, `V$DATABASE`, and `V$PDBS`.

 **Note:**

This parameter is available starting with Oracle Database 23ai.

## 2.324 READ\_ONLY\_OPEN\_DELAYED

`READ_ONLY_OPEN_DELAYED` determines when datafiles in read-only tablespaces are accessed.

| Property              | Description |
|-----------------------|-------------|
| <b>Parameter type</b> | Boolean     |

| Property            | Description  |
|---------------------|--------------|
| Default value       | false        |
| Modifiable          | No           |
| Modifiable in a PDB | No           |
| Range of values     | true   false |
| Basic               | No           |

#### Values

- true  
The datafiles are accessed for the first time only when an attempt is made to read data stored within them.
- false  
The datafiles are accessed at database open time.

You can use this parameter to speed up some operations (primarily opening the database) for very large databases when substantial portions of the database are stored in read-only tablespaces. Consider setting this parameter to `true` for such databases, especially if portions of the read-only data are stored on slow-access devices or hierarchical storage.

#### See Also:

*Oracle Database Administrator's Guide* for information on the consequences of delaying access of datafiles in read-only tablespaces

## 2.325 RECOVERY\_PARALLELISM

`RECOVERY_PARALLELISM` specifies the number of processes to participate in instance or crash recovery.

| Property            | Description                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------|
| Parameter type      | Integer                                                                                                 |
| Default value       | System-determined parallel recovery                                                                     |
| Modifiable          | ALTER SYSTEM                                                                                            |
| Modifiable in a PDB | No                                                                                                      |
| Range of values     | System-determined, but cannot exceed <code>PARALLEL_MAX_SERVERS</code> initialization parameter setting |
| Basic               | No                                                                                                      |

To force serial crash and instance recovery, set the `RECOVERY_PARALLELISM` parameter to 0 or 1. 0 or 1 disable parallel instance and crash recovery on a system that has multiple CPUs. An alert log displays the degree of parallelism that was chosen when the database instance/ recovery starts.

 **See Also:**

- *Oracle Real Application Clusters Administration and Deployment Guide* for information on setting this parameter in an Oracle RAC environment

## 2.326 RECYCLEBIN

RECYCLEBIN is used to control whether the Flashback Drop capability is turned on or off.

| Property            | Description                              |
|---------------------|------------------------------------------|
| Parameter type      | String                                   |
| Syntax              | RECYCLEBIN = { on   off }                |
| Default value       | on                                       |
| Modifiable          | ALTER SESSION, ALTER SYSTEM ... DEFERRED |
| Modifiable in a PDB | Yes                                      |
| Basic               | No                                       |

If the parameter is set to `off`, then dropped tables do not go into the recycle bin. If this parameter is set to `on`, then dropped tables go into the recycle bin and can be recovered.

 **See Also:**

*Oracle Database Administrator's Guide* for more information about using Flashback Drop and managing the recycle bin

## 2.327 REDO\_TRANSPORT\_USER

REDO\_TRANSPORT\_USER specifies the name of the user whose password verifier is used when a remote login password file is used for redo transport authentication. This user must have the SYSOPER privilege and must have the same password in the database that initiates the redo transport session and in the database that is the target of the redo transport session.

| Property            | Description                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------|
| Parameter type      | String                                                                                          |
| Syntax              | REDO_TRANSPORT_USER = <i>user_name</i>                                                          |
| Default value       | There is no default value.                                                                      |
| Range of values     | Any character string that matches the name of a user who has been granted the SYSOPER privilege |
| Modifiable          | ALTER SYSTEM                                                                                    |
| Modifiable in a PDB | No                                                                                              |
| Basic               | No                                                                                              |
| Oracle RAC          | Every instance should use the same value                                                        |

The value of this parameter is case sensitive and must exactly match the value of the `USERNAME` column of a row in the `V$PWFILE_USERS` view. The value of the `SYSOPER` column of the row must also be `TRUE`.

If this parameter is not specified, then the password verifier of the `SYS` user will be used when a remote login password file is used for redo transport authentication.

**See Also:**

*Oracle Data Guard Concepts and Administration* for more information about this parameter

## 2.328 REMOTE\_DEPENDENCIES\_MODE

`REMOTE_DEPENDENCIES_MODE` specifies how Oracle should handle dependencies upon remote PL/SQL stored procedures.

| Property                   | Description                                                       |
|----------------------------|-------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                            |
| <b>Syntax</b>              | <code>REMOTE_DEPENDENCIES_MODE = { TIMESTAMP   SIGNATURE }</code> |
| <b>Default value</b>       | <code>TIMESTAMP</code>                                            |
| <b>Modifiable</b>          | <code>ALTER SESSION, ALTER SYSTEM</code>                          |
| <b>Modifiable in a PDB</b> | Yes                                                               |
| <b>Basic</b>               | No                                                                |

### Values

- `TIMESTAMP`

The client running the procedure compares the timestamp recorded on the server-side procedure with the current timestamp of the local procedure and executes the procedure only if the timestamps match.

- `SIGNATURE`

Oracle allows the procedure to execute as long as the signatures are considered safe. This setting allows client PL/SQL applications to be run without recompilation.

**See Also:**

*Oracle Database Development Guide* for suggestions for managing dependencies

## 2.329 REMOTE\_LISTENER

`REMOTE_LISTENER` specifies a network name that resolves to an address or address list of Oracle Net remote listeners (that is, listeners that are not running on the same system as this instance). The address or address list is specified in the `TNSNAMES.ORA` file or other address repository as configured for your system.

| Property            | Description                           |
|---------------------|---------------------------------------|
| Parameter type      | String                                |
| Syntax              | REMOTE_LISTENER = <i>network_name</i> |
| Default value       | There is no default value.            |
| Modifiable          | ALTER SYSTEM                          |
| Modifiable in a PDB | Yes                                   |
| Basic               | Yes                                   |

 **See Also:**

- *Oracle Database Concepts* for more information about listener processes and dispatcher processes
- *Oracle Database Net Services Administrator's Guide* and your operating system-specific Oracle documentation for more information about specifying network addresses for the protocols on your system
- *Oracle Clusterware Administration and Deployment Guide* for information about SCAN addresses

## 2.330 REMOTE\_LOGIN\_PASSWORDFILE

REMOTE\_LOGIN\_PASSWORDFILE specifies whether Oracle checks for a password file.

| Property            | Description                                               |
|---------------------|-----------------------------------------------------------|
| Parameter type      | String                                                    |
| Syntax              | REMOTE_LOGIN_PASSWORDFILE = { shared   exclusive   none } |
| Default value       | exclusive                                                 |
| Modifiable          | No                                                        |
| Modifiable in a PDB | No                                                        |
| Basic               | Yes                                                       |
| Oracle RAC          | Multiple instances must have the same value.              |

### Values

- shared

One or more databases can use the password file. The password file can contain SYS and non-SYS users.

When REMOTE\_LOGIN\_PASSWORDFILE is set to shared:

- The SYS password cannot be changed. If you try, the password change operation fails with "ORA-28046: Password change for SYS disallowed."

- The password of any user who has SYS\* admin privileges (SYSDBA, SYSOPER, SYSASM, SYSBACKUP, SYSDG, SYSKM) cannot be changed. If you try, the password change operation fails with "ORA-01999: password file cannot be updated in SHARED mode."
  - Grants of SYS\* admin privileges (SYSDBA, SYSOPER, SYSASM, SYSBACKUP, SYSDG, SYSKM) to individual users are not allowed. For example, `grant sysdba to scott` fails with "ORA-01999: password file cannot be updated in SHARED mode." Similarly, revoke of SYS\* admin privileges fails.
  - If the password file does not exist, then the behavior is the same as setting `REMOTE_LOGIN_PASSWORDFILE` to `none`.
- `exclusive`

The password file can be used by only one database. The password file can contain SYS and non-SYS users.

When `REMOTE_LOGIN_PASSWORDFILE` is set to `exclusive`, if the password file does not exist, then the behavior is the same as setting `REMOTE_LOGIN_PASSWORDFILE` to `none`.

- `none`

Oracle ignores any password file. Therefore, privileged users must be authenticated by the operating system.

**Note:**

If you change `REMOTE_LOGIN_PASSWORDFILE` to `exclusive` or `shared` from `none`, then ensure that the password file is synchronized with the dictionary passwords.

## 2.331 REMOTE\_OS\_ROLES

`REMOTE_OS_ROLES` specifies whether operating system roles are allowed for remote clients.

| Property            | Description  |
|---------------------|--------------|
| Parameter type      | Boolean      |
| Default value       | false        |
| Modifiable          | No           |
| Modifiable in a PDB | No           |
| Range of values     | true   false |
| Basic               | No           |

The default value, `false`, causes Oracle to identify and manage roles for remote clients.

**See Also:**

- *Oracle Database Security Guide* for more information on setting this parameter
- `"OS_ROLES"`

## 2.332 REMOTE\_RECOVERY\_FILE\_DEST

REMOTE\_RECOVERY\_FILE\_DEST specifies a directory from which to read archive log files during a pluggable database (PDB) refresh operation if the source is not available.

| Property                   | Description                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                                                                                                          |
| <b>Syntax</b>              | REMOTE_RECOVERY_FILE_DEST = string                                                                                                                                              |
| <b>Default value</b>       | None                                                                                                                                                                            |
| <b>Modifiable</b>          | ALTER SYSTEM ... SID='*'                                                                                                                                                        |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                             |
| <b>Basic</b>               | No                                                                                                                                                                              |
| <b>Oracle RAC</b>          | The directory location where archive redo logs are accessible can be different on different instances, so this parameter can be set to different values on different instances. |

For a PDB refresh copy to be in sync with its source, redo is accessed from the source PDB over a database link. Sometimes the source PDB or the CDB to which the source PDB belongs is not accessible when the refresh copy needs to be updated. In those cases, if this parameter is set, an attempt will be made to read archive log files from the directory specified by this parameter.

## 2.333 REPLICATION\_DEPENDENCY\_TRACKING

REPLICATION\_DEPENDENCY\_TRACKING enables or disables dependency tracking for read/write operations to the database.

| Property                   | Description  |
|----------------------------|--------------|
| <b>Parameter type</b>      | Boolean      |
| <b>Default value</b>       | true         |
| <b>Modifiable</b>          | No           |
| <b>Modifiable in a PDB</b> | No           |
| <b>Range of values</b>     | true   false |
| <b>Basic</b>               | No           |

Dependency tracking is essential for propagating changes in a replicated environment in parallel.

### Values

- TRUE  
Enables dependency tracking.
- FALSE

Allows read/write operations to the database to run faster, but does not produce dependency information for Oracle to perform parallel propagation.

 **Note:**

Do not specify this value unless you are sure that your application will not perform any read/write operations to the replicated tables.

## 2.334 RESOURCE\_LIMIT

RESOURCE\_LIMIT determines whether resource limits are enforced in database profiles.

| Property            | Description  |
|---------------------|--------------|
| Parameter type      | Boolean      |
| Default value       | true         |
| Modifiable          | ALTER SYSTEM |
| Modifiable in a PDB | Yes          |
| Range of values     | true   false |
| Basic               | No           |

### Values

- TRUE  
Enables the enforcement of resource limits
- FALSE  
Disables the enforcement of resource limits

 **See Also:**

*Oracle Database Administrator's Guide* and *Oracle Database SQL Language Reference* for more information on setting resource limits for profiles

## 2.335 RESOURCE\_MANAGE\_GOLDENGATE

RESOURCE\_MANAGE\_GOLDENGATE determines whether Oracle GoldenGate apply processes in the database are resource managed.

| Property            | Description  |
|---------------------|--------------|
| Parameter type      | Boolean      |
| Default value       | false        |
| Modifiable          | ALTER SYSTEM |
| Modifiable in a PDB | No           |
| Range of values     | true   false |
| Basic               | No           |

| Property   | Description                              |
|------------|------------------------------------------|
| Oracle RAC | All instances should use the same value. |

To enable Resource Manager, set the `RESOURCE_MANAGER_PLAN` parameter.

By default, Oracle GoldenGate apply processes in the database are not resource managed. Given that replication to a PDB requires a separate Oracle GoldenGate apply process, it is possible that the apply processes for one PDB could end up consuming most of the CPU on the machine, even if there is a CPU resource management plan in place to limit CPU usage per PDB.

You can set the following values for the `RESOURCE_MANAGER_GOLDENGATE` parameter:

- **TRUE:** With this setting, Oracle GoldenGate apply processes in the database are resource managed based on the resources allocated to the GoldenGate apply user.
- **FALSE:** With this setting, Oracle GoldenGate apply processes are not resource managed.

## 2.336 RESOURCE\_MANAGER\_CPU\_ALLOCATION

`RESOURCE_MANAGER_CPU_ALLOCATION` specifies the number of CPUs that the Resource Manager should use. The Resource Manager controls how a system's CPUs are utilized by its database's sessions.

| Property            | Description                                                  |
|---------------------|--------------------------------------------------------------|
| Parameter type      | Integer                                                      |
| Default value       | The number of logical CPUs reported by the operating system. |
| Modifiable          | ALTER SYSTEM                                                 |
| Modifiable in a PDB | No                                                           |
| Range of values     | 0 to operating system-specific                               |
| Basic               | No                                                           |

### Note:

The `RESOURCE_MANAGER_CPU_ALLOCATION` parameter is deprecated. It is retained for backward compatibility only. Use the `CPU_COUNT` parameter instead.

The Resource Manager schedules database sessions on the CPUs according to a resource plan that has been configured and enabled by the DBA. Normally, the Resource Manager schedules enough database sessions to keep all CPUs utilized. However, in some scenarios, a DBA may only want to schedule enough database sessions to keep a subset of the CPUs utilized.

### See Also:

"[CPU\\_COUNT](#)"

## 2.337 RESOURCE\_MANAGER\_CPU\_SCOPE

RESOURCE\_MANAGER\_CPU\_SCOPE controls the scope of CPU resource management.

In previous releases, Oracle offered one method of CPU resource management, which operated within a database instance. Starting with Oracle Database 23ai, Oracle offers an alternative method for CPU resource management, which operates across all database instances on the server. This parameter allows you to choose between the two methods.

| Property            | Description                                                  |
|---------------------|--------------------------------------------------------------|
| Parameter type      | String                                                       |
| Syntax              | RESOURCE_MANAGER_CPU_SCOPE = { SERVER_WIDE   INSTANCE_ONLY } |
| Default value       | INSTANCE_ONLY                                                |
| Modifiable          | No                                                           |
| Modifiable in a PDB | No                                                           |
| Basic               | No                                                           |
| Oracle RAC          | The same value must be used on all instances.                |

### Values:

- **SERVER\_WIDE** - Enables server-level inter-instance CPU resource management

Introduced in Oracle Database 23ai, this method can be used when multiple database instances share a Linux server. It enables CPU resource management across all database instances on the server. With this method, Oracle automatically configures Linux control groups (cgroups) with the desired CPU sharing and CPU utilization limits, and then places database sessions into the appropriate cgroups.

In order to use this method, the following system and database requirements must be met:

- This method requires the Linux operating system. It is supported on Oracle Autonomous Database, Oracle Database Exadata Cloud@Customer, Oracle Database Exadata Cloud Service, and on-premises Oracle Exadata systems. This method is not supported on non-Exadata Linux systems.
- The server operating system must be Unbreakable Enterprise Kernel (UEK) version 5 or later.

You can configure this method as follows:

- Oracle Autonomous Database: All system and database requirements are installed and configured by default. RESOURCE\_MANAGER\_CPU\_SCOPE is set to SERVER\_WIDE by default.
- Oracle Database Exadata Cloud@Customer: All system and database requirements are installed and configured by default. RESOURCE\_MANAGER\_CPU\_SCOPE is set to INSTANCE\_ONLY by default. You must set it to SERVER\_WIDE if you want to use this method.
- Oracle Database Exadata Cloud Service and on-premises Oracle Exadata systems: The Exadata image meets all system and database requirements. RESOURCE\_MANAGER\_CPU\_SCOPE is set to INSTANCE\_ONLY by default. You must set it to SERVER\_WIDE if you want to use this method.

When you specify the SERVER\_WIDE setting, the value of the PROCESSOR\_GROUP\_NAME initialization parameter is ignored.

- `INSTANCE_ONLY` - Enables CPU resource management only within the database instance.

This is the method of CPU resource management used in releases prior to Oracle Database 23ai. It is supported on all Oracle Databases.

 **Note:**

This parameter is available starting with Oracle Database 23ai.

 **See Also:**

*Oracle Database Administrator's Guide* for more information about setting this parameter

## 2.338 RESOURCE\_MANAGER\_PLAN

`RESOURCE_MANAGER_PLAN` specifies the resource plan to use for a database (CDB or non-CDB).

| Property            | Description                                             |
|---------------------|---------------------------------------------------------|
| Parameter type      | String                                                  |
| Syntax              | <code>RESOURCE_MANAGER_PLAN = resource_plan_name</code> |
| Default value       | There is no default value.                              |
| Modifiable          | <code>ALTER SYSTEM</code>                               |
| Modifiable in a PDB | Yes                                                     |
| Range of values     | Any valid character string                              |
| Basic               | No                                                      |

### In a CDB

In the root for a CDB, `RESOURCE_MANAGER_PLAN` specifies the CDB resource plan. A CDB resource plan allocates resources among PDBs.

A CDB resource plan is created using `DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN` and `CREATE_CDB_PLAN_DIRECTIVE`.

 **See Also:**

- *Oracle Database Administrator's Guide* for more information about using `DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN` and `DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN_DIRECTIVE`
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `CREATE_CDB_PLAN` procedure and `CREATE_CDB_PLAN_DIRECTIVE` procedure for the `DBMS_RESOURCE_MANAGER` package

A session must be `root` to change the value of `RESOURCE_MANAGER_PLAN` for a CDB using the `ALTER SYSTEM` statement. For example, to enable and disable a CDB resource plan:

```
SQL> ALTER SYSTEM SET RESOURCE_MANAGER_PLAN = CDB_resource_plan_name;
SQL> ALTER SYSTEM SET RESOURCE_MANAGER_PLAN = '';
```

In a PDB, `RESOURCE_MANAGER_PLAN` specifies the PDB resource plan to use for the PDB.

A session must be in the PDB to enable or disable a PDB resource plan for that PDB. For example, to enable and disable a PDB resource plan:

```
SQL> ALTER SYSTEM SET RESOURCE_MANAGER_PLAN = PDB_resource_plan_name;
SQL> ALTER SYSTEM SET RESOURCE_MANAGER_PLAN = '';
```

In a PDB, the PDB resource plan has some restrictions compared to the resource plan of a non-CDB. The following restrictions apply to PDB resource plans:

- A PDB resource plan cannot have subplans.
- A PDB resource plan can have a maximum of eight consumer groups.
- A PDB resource plan cannot have a multiple-level scheduling policy.

To enforce certain PDB resource plan policies, policies regarding resource allocation among PDBs should exist in the CDB resource plan. Without a CDB resource plan, certain PDB resource plan policies will not be enforced. If a PDB resource plan contains CPU or parallel statement queuing directives and a CDB resource plan is not specified, then Resource Manager will automatically enable the `DEFAULT_CDB_PLAN` plan. To prevent this behavior, set the `RESOURCE_MANAGER_PLAN` parameter at the root level to `ORA$INTERNAL_CDB_PLAN`.

**Note:**

See *Oracle Database Administrator's Guide* for information on CPU, I/O bandwidth, and parallel execution servers requirements in CDB resource plans, and for a description of the results in the PDB resource plans when those requirements are not met.

**In a Non-CDB**

`RESOURCE_MANAGER_PLAN` specifies the top-level resource plan to use for an instance in a non-CDB. The resource manager will load this top-level resource plan along with all its descendants (subplans, directives, and consumer groups). If you do not specify this parameter, the resource manager is off by default.

You can change the setting of this parameter using the `ALTER SYSTEM` statement to turn on the resource manager (if it was previously off) or to turn off the resource manager or change the current resource plan (if it was previously on). If you specify a resource plan that does not exist in the data dictionary, Oracle returns an error message.

 **See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_RESOURCE_MANAGER` package
- *Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_RESOURCE_MANAGER_PRIVS` package
- "[DBA\\_RSRC\\_PLANS](#)", "[DBA\\_RSRC\\_PLAN\\_DIRECTIVES](#)", and the various `V$RSRC_*` dynamic performance views in [Dynamic Performance Views](#) for information on existing resource plans

## 2.339 RESULT\_CACHE\_AUTO\_BLOCKLIST

Use `RESULT_CACHE_AUTO_BLOCKLIST` to enable or disable adaptive result cache object exclusion.

| Property                   | Description                                             |
|----------------------------|---------------------------------------------------------|
| <b>Parameter type</b>      | String                                                  |
| <b>Syntax</b>              | <code>RESULT_CACHE_AUTO_BLOCKLIST = { OFF   ON }</code> |
| <b>Default value</b>       | ON                                                      |
| <b>Modifiable</b>          | ALTER SYSTEM                                            |
| <b>Modifiable in a PDB</b> | Yes                                                     |
| <b>Basic</b>               | No                                                      |
| <b>Oracle RAC</b>          | Different instances can use different values.           |

When this parameter is set to `ON`, adaptive result cache object exclusion is enabled.

When this parameter is set to `OFF`, adaptive result cache object exclusion is disabled.

 **Note:**

This parameter is available starting with Oracle Database 23ai.

## 2.340 RESULT\_CACHE\_EXECUTION\_THRESHOLD

`RESULT_CACHE_EXECUTION_THRESHOLD` specifies the maximum number of times a PL/SQL function can be executed before its result is stored in the result cache.

| Property              | Description |
|-----------------------|-------------|
| <b>Parameter type</b> | Integer     |
| <b>Default value</b>  | 2           |

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Modifiable</b>          | ALTER SYSTEM                                  |
| <b>Modifiable in a PDB</b> | Yes                                           |
| <b>Range of values</b>     | 0 to operating system-dependent               |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Multiple instances can have different values. |

## 2.341 RESULT\_CACHE\_INTEGRITY

RESULT\_CACHE\_INTEGRITY specifies whether the database enforces result cache integrity.

| Property                   | Description                                                                 |
|----------------------------|-----------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                      |
| <b>Syntax</b>              | RESULT_CACHE_INTEGRITY = { ENFORCED   TRUSTED }                             |
| <b>Default value</b>       | Oracle Autonomous Database: ENFORCED<br>All other Oracle databases: TRUSTED |
| <b>Modifiable</b>          | ALTER SYSTEM                                                                |
| <b>Modifiable in a PDB</b> | Yes                                                                         |
| <b>Basic</b>               | No                                                                          |
| <b>Oracle RAC</b>          | Different instances can have different values.                              |

### Values:

- ENFORCED

Regardless of the setting of the RESULT\_CACHE\_MODE initialization parameter or any specified hints, only deterministic constructs will be eligible for result caching. For example, queries using PL/SQL functions that are not explicitly declared as deterministic will not be cached. This setting enforces result cache integrity.

- TRUSTED

The database honors the setting of the RESULT\_CACHE\_MODE initialization parameter and any specified hints, and will consider queries using possibly nondeterministic constructs as candidates for result caching. For example, queries using PL/SQL functions that are not explicitly declared as deterministic may be cached. Results that are certain to be nondeterministic (for example, SYSDATE or constructs involving SYSDATE) will not be cached. This setting does not enforce result cache integrity, which matches the behavior in releases prior to Oracle Database 23ai.

### Note:

This parameter is available starting with Oracle Database 23ai.

**See Also:**["RESULT\\_CACHE\\_MODE"](#)

## 2.342 RESULT\_CACHE\_MAX\_RESULT

RESULT\_CACHE\_MAX\_RESULT specifies the percentage of RESULT\_CACHE\_MAX\_SIZE that any single result can use.

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Parameter type</b>      | Integer                                       |
| <b>Default value</b>       | 5 percent                                     |
| <b>Modifiable</b>          | ALTER SYSTEM                                  |
| <b>Modifiable in a PDB</b> | Yes                                           |
| <b>Range of values</b>     | 0 to 100                                      |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Multiple instances can have different values. |

## 2.343 RESULT\_CACHE\_MAX\_SIZE

RESULT\_CACHE\_MAX\_SIZE specifies the maximum amount of SGA memory (in bytes) that can be used by the result cache.

| Property                   | Description                                                                                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                                                                                                                                                                |
| <b>Syntax</b>              | RESULT_CACHE_MAX_SIZE = <i>integer</i> [K   M   G]                                                                                                                                                         |
| <b>Default value</b>       | Derived from the values of SHARED_POOL_SIZE, SGA_TARGET, and MEMORY_TARGET                                                                                                                                 |
| <b>Modifiable</b>          | ALTER SYSTEM                                                                                                                                                                                               |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                        |
| <b>Range of values</b>     | 0 to operating system-dependent                                                                                                                                                                            |
| <b>Basic</b>               | No                                                                                                                                                                                                         |
| <b>Oracle RAC</b>          | You must either set this parameter to 0 on all instances to disable the result cache, or use a nonzero value on all instances. Disabling the result cache on some instances may lead to incorrect results. |

Values of this parameter greater than 0 are rounded up to the next multiple of 32 KB. If the value of this parameter is 0, then the feature is disabled.

**See Also:**

*Oracle Database Performance Tuning Guide* for information about tuning the result cache

## 2.344 RESULT\_CACHE\_MAX\_TEMP\_RESULT

`RESULT_CACHE_MAX_TEMP_RESULT` specifies the percentage of `RESULT_CACHE_MAX_TEMP_SIZE` that any single cached query result can consume.

| Property            | Description                                   |
|---------------------|-----------------------------------------------|
| Parameter type      | Integer                                       |
| Default value       | 5 percent                                     |
| Modifiable          | ALTER SYSTEM                                  |
| Modifiable in a PDB | Yes                                           |
| Range of values     | 0 to 100                                      |
| Basic               | No                                            |
| Oracle RAC          | Multiple instances can have different values. |

## 2.345 RESULT\_CACHE\_MAX\_TEMP\_SIZE

`RESULT_CACHE_MAX_TEMP_SIZE` specifies the maximum amount of temporary tablespace (in bytes) that can be consumed by the result cache.

| Property            | Description                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | Big integer                                                                                                                                                                                                |
| Syntax              | <code>RESULT_CACHE_MAX_TEMP_SIZE = integer [K   M   G]</code>                                                                                                                                              |
| Default value       | <code>RESULT_CACHE_MAX_SIZE * 10</code>                                                                                                                                                                    |
| Modifiable          | ALTER SYSTEM                                                                                                                                                                                               |
| Modifiable in a PDB | Yes                                                                                                                                                                                                        |
| Range of values     | 0 to operating system-dependent                                                                                                                                                                            |
| Basic               | No                                                                                                                                                                                                         |
| Oracle RAC          | You must either set this parameter to 0 on all instances to disable the result cache, or use a nonzero value on all instances. Disabling the result cache on some instances may lead to incorrect results. |

If you attempt to set this parameter to a value that is less than 5% of the size of the SGA, then this parameter will be set to 5% of the size of the SGA. If you attempt to set this parameter to a value that is more than 10% of the current total unused space available for temporary tablespaces in the `SYS` schema, then this parameter will be set to 10% of the current total unused space available for temporary tablespaces in the `SYS` schema.

If the value of this parameter is 0, then the result cache is disabled for the PDB.

## 2.346 RESULT\_CACHE\_MODE

`RESULT_CACHE_MODE` specifies which queries are eligible to store result sets in the result cache. Only query execution plans with the result cache operator will attempt to read from or write to the result cache.

| Property                   | Description                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                            |
| <b>Syntax</b>              | <code>RESULT_CACHE_MODE = { MANUAL   MANUAL_TEMP   FORCE   FORCE_TEMP }</code>                    |
| <b>Default value</b>       | Oracle Autonomous Database: <code>FORCE</code><br>All other Oracle databases: <code>MANUAL</code> |
| <b>Modifiable</b>          | <code>ALTER SESSION</code> , <code>ALTER SYSTEM</code>                                            |
| <b>Modifiable in a PDB</b> | Yes                                                                                               |
| <b>Basic</b>               | No                                                                                                |
| <b>Oracle RAC</b>          | Different instances can have different values.                                                    |

### Values

- `MANUAL`  
Query results can only be stored in the result cache by using a query hint or table annotation.
- `MANUAL_TEMP`  
Query results can only be stored in the result cache by using a query hint or table annotation. All hinted queries are allowed to leverage temporary segments on disk unless explicitly prohibited by using the `/*+ RESULT_CACHE (TEMP=FALSE) */` hint.
- `FORCE`  
All query results are stored in the result cache. If a query result is not in the cache, then the database executes the query and stores the result in the cache. Subsequent executions of the same SQL statement that include the `/*+ RESULT_CACHE */` hint will retrieve data from the cache. Sessions will use these results, if possible. To exclude query results from the cache, use the `/*+ NO_RESULT_CACHE */` hint.
- `FORCE_TEMP`  
All query results are stored in the result cache. All queries are allowed to leverage temporary segments on disk unless explicitly prohibited by a hint.

### Caution:

If this parameter is set to `FORCE` or `FORCE_TEMP`, then Oracle recommends setting the `RESULT_CACHE_INTEGRITY` parameter to `ENFORCED`, which ensures that only deterministic constructs are eligible for result caching. This prevents the caching of nondeterministic constructs, which can potentially cause material changes to results. See "[RESULT\\_CACHE\\_INTEGRITY](#)" for more information.

 **See Also:**

- *Oracle Database SQL Language Reference* for more information about the `NO_RESULT_CACHE` hint

## 2.347 RESULT\_CACHE\_REMOTE\_EXPIRATION

`RESULT_CACHE_REMOTE_EXPIRATION` specifies the number of minutes that a result using a remote object is allowed to remain valid.

| Property                   | Description                     |
|----------------------------|---------------------------------|
| <b>Parameter type</b>      | Integer                         |
| <b>Default value</b>       | 0                               |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM     |
| <b>Modifiable in a PDB</b> | Yes                             |
| <b>Range of values</b>     | 0 to operating system-dependent |
| <b>Basic</b>               | No                              |

Setting this parameter to 0 implies that results using remote objects should not be cached. Setting this parameter to a nonzero value can produce stale answers (for example, if the remote table used by a result is modified at the remote database).

 **See Also:**

*Oracle Database Performance Tuning Guide* for information about tuning the result cache

## 2.348 RESUMABLE\_TIMEOUT

`RESUMABLE_TIMEOUT` enables or disables resumable statements and specifies resumable timeout at the system level.

| Property                   | Description                    |
|----------------------------|--------------------------------|
| <b>Parameter type</b>      | Integer                        |
| <b>Default value</b>       | 0 (seconds)                    |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM    |
| <b>Modifiable in a PDB</b> | Yes                            |
| <b>Range of values</b>     | 0 to $2^{31} - 1$ (in seconds) |
| <b>Basic</b>               | No                             |

| Property   | Description                                   |
|------------|-----------------------------------------------|
| Oracle RAC | Multiple instances can have different values. |

**See Also:**

*Oracle Database Administrator's Guide* for more information about enabling resumable space allocation, what conditions are correctable, and what statements can be made resumable

## 2.349 ROLLBACK\_SEGMENTS

ROLLBACK\_SEGMENTS allocates one or more rollback segments by name to this instance.

| Property            | Description                                                                                                                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | String                                                                                                                                                                                                                                                           |
| Syntax              | ROLLBACK_SEGMENTS =<br>(segment_name [, segment_name] ... )                                                                                                                                                                                                      |
| Default value       | If you do not specify this parameter, the instance uses public rollback segments by default, unless the UNDO_MANAGEMENT initialization parameter is set to AUTO. In that case, the ROLLBACK_SEGMENTS parameter is ignored and automatic undo management is used. |
| Modifiable          | No                                                                                                                                                                                                                                                               |
| Modifiable in a PDB | Yes                                                                                                                                                                                                                                                              |
| Range of values     | Any rollback segment names listed in DBA_ROLLBACK_SEGS except SYSTEM                                                                                                                                                                                             |
| Basic               | No                                                                                                                                                                                                                                                               |
| Oracle RAC          | Multiple instances must have different values.                                                                                                                                                                                                                   |

If you set this parameter, the instance acquires all of the rollback segments named in this parameter, even if the number of rollback segments exceeds the minimum number required by the instance (calculated as `TRANSACTIONS / TRANSACTIONS_PER_ROLLBACK_SEGMENT`).

You cannot change the value of this parameter dynamically, but you can change its value and then restart the instance. Although this parameter usually specifies private rollback segments, it can also specify public rollback segments if they are not already in use.

To find the name, segment ID number, and status of each rollback segment in the database, query the data dictionary view `DBA_ROLLBACK_SEGS`.

When `UNDO_MANAGEMENT` is set to `AUTO`, `ROLLBACK_SEGMENTS` is ignored.

 **See Also:**

- *Oracle Real Application Clusters Administration and Deployment Guide* for information on setting this parameter in an Oracle RAC environment

## 2.350 SAGA\_HIST\_RETENTION

SAGA\_HIST\_RETENTION specifies the length of time (in minutes) that completed sagas are retained in the DBA\_HIST\_SAGAS and USER\_HIST\_SAGAS views.

| Property            | Description                                  |
|---------------------|----------------------------------------------|
| Parameter type      | Integer                                      |
| Default value       | 43200 minutes (equivalent to 30 days)        |
| Modifiable          | ALTER SYSTEM                                 |
| Modifiable in a PDB | No                                           |
| Range of values     | 1 - 2147483647 minutes                       |
| Basic               | No                                           |
| Oracle RAC          | Multiple instances must have the same value. |

 **Note:**

This parameter is available starting with Oracle Database 23ai.

 **See Also:**

- ["ALL\\_HIST\\_SAGAS"](#)
- ["DBA\\_HIST\\_SAGAS"](#)
- ["USER\\_HIST\\_SAGAS"](#)

## 2.351 SEC\_MAX\_FAILED\_LOGIN\_ATTEMPTS

SEC\_MAX\_FAILED\_LOGIN\_ATTEMPTS specifies the number of authentication attempts that can be made by a client on a connection to the server process.

| Property       | Description |
|----------------|-------------|
| Parameter type | Integer     |
| Default value  | 3           |
| Modifiable     | No          |

| Property                   | Description                            |
|----------------------------|----------------------------------------|
| <b>Modifiable in a PDB</b> | No                                     |
| <b>Range of values</b>     | An integer greater than or equal to 1. |
| <b>Basic</b>               | No                                     |

These login attempts can be for multiple user accounts in the same connection. After the specified number of failure attempts, the connection will be automatically dropped by the server process, and the server process is terminated.

#### See Also:

*Oracle Database Security Guide* for more information about this parameter

## 2.352 SEC\_PROTOCOL\_ERROR\_FURTHER\_ACTION

`SEC_PROTOCOL_ERROR_FURTHER_ACTION` specifies the further execution of a server process when receiving bad packets from a possibly malicious client.

| Property                   | Description                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                             |
| <b>Syntax</b>              | <code>SEC_PROTOCOL_ERROR_FURTHER_ACTION = { CONTINUE   (DELAY, integer)   (DROP, integer) }</code> |
| <b>Default value</b>       | <code>(DROP, 3)</code>                                                                             |
| <b>Modifiable</b>          | ALTER SYSTEM                                                                                       |
| <b>Modifiable in a PDB</b> | No                                                                                                 |
| <b>Basic</b>               | No                                                                                                 |

#### Values

- `CONTINUE`  
The server process continues execution. The database server may be subject to a Denial of Service (DoS) if bad packets continue to be sent by a malicious client.
- `(DELAY, integer)`  
The client experiences a delay of *integer* seconds before the server process accepts the next request from the same client connection. Malicious clients are prevented from excessive consumption of server resources while legitimate clients experience a degradation in performance but can continue to function.
- `(DROP, integer)`  
The server forcefully terminates the client connection after *integer* cumulative bad packets. The server protects itself at the expense of the client (for example, a client transaction may be lost). The client may reconnect and attempt the same operation.

**See Also:**

*Oracle Database Security Guide* for examples of using this parameter

## 2.353 SEC\_PROTOCOL\_ERROR\_TRACE\_ACTION

SEC\_PROTOCOL\_ERROR\_TRACE\_ACTION specifies the kind of logging the database server does when bad packets are received from a possibly malicious client, apart from the client receiving the error.

| Property                   | Description                                                      |
|----------------------------|------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                           |
| <b>Syntax</b>              | SEC_PROTOCOL_ERROR_TRACE_ACTION = { NONE   TRACE   LOG   ALERT } |
| <b>Default value</b>       | TRACE                                                            |
| <b>Modifiable</b>          | ALTER SYSTEM                                                     |
| <b>Modifiable in a PDB</b> | No                                                               |
| <b>Basic</b>               | No                                                               |

### Values

- NONE  
The database server does not record it in any of the trace files.
- TRACE  
A short entry is made in the alert log file and a detailed incident file is generated. The server trace file also will have an entry about the protocol error and incident file.
- LOG  
The server trace file will have an entry about the protocol violation.
- ALERT  
A short entry is made in the alert log file and in the server trace file about the protocol violation.

## 2.354 SEC\_RETURN\_SERVER\_RELEASE\_BANNER

SEC\_RETURN\_SERVER\_RELEASE\_BANNER specifies whether the server returns complete database software information to unauthenticated clients.

| Property                   | Description |
|----------------------------|-------------|
| <b>Parameter type</b>      | Boolean     |
| <b>Default value</b>       | false       |
| <b>Modifiable</b>          | No          |
| <b>Modifiable in a PDB</b> | No          |

| Property        | Description  |
|-----------------|--------------|
| Range of values | true   false |
| Basic           | No           |

#### Values

- true  
Returns complete database version information to the client.
- false  
Returns a generic version string to the client.

#### See Also:

*Oracle Call Interface Developer's Guide* and *Oracle Database Security Guide* for more information on controlling the display of the database version banner.

## 2.355 SERIAL\_REUSE

**SERIAL\_REUSE** specifies which types of cursors make use of the serial-reusable memory feature. This feature allocates private cursor memory in the SGA so that it can be reused (serially, not concurrently) by sessions executing the same cursor.

| Property            | Description                                                                  |
|---------------------|------------------------------------------------------------------------------|
| Parameter type      | String                                                                       |
| Syntax              | <code>SERIAL_REUSE = { disable   all   select   dml   plsql   force }</code> |
| Default value       | disable                                                                      |
| Modifiable          | No                                                                           |
| Modifiable in a PDB | No                                                                           |
| Basic               | No                                                                           |

#### Note:

The **SERIAL\_REUSE** parameter is deprecated. It is retained for backward compatibility only.

#### Values

- disable  
Disables the option for all SQL statement types. This value overrides any other values included in the list.
- all

Enables the option for both DML and `SELECT` statements. Equivalent to setting `select`, `dml`, and `plsql`.

- `select`

Enables the option for `SELECT` statements.

- `dml`

Enables the option for DML statements.

- `plsql`

Currently has no effect (although PL/SQL packages do support the serial-reuse memory option using PL/SQL pragmas).

**Note:**

If `CURSOR_SPACE_FOR_TIME` is set to `true`, then the value of `SERIAL_REUSE` is ignored and treated as if it were set to `disable`.

**See Also:**

["CURSOR\\_SPACE\\_FOR\\_TIME"](#)

## 2.356 SERVICE\_NAMES

`SERVICE_NAMES` specifies one or more names by which clients can connect to the instance.

| Property                   | Description                                                                                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                                                                                                                                     |
| <b>Syntax</b>              | <code>SERVICE_NAMES =</code><br><code>db_service_name [, db_service_name [ ... ] ]</code>                                                                                                                  |
| <b>Default value</b>       | <code>DB_UNIQUE_NAME.DB_DOMAIN</code> if defined                                                                                                                                                           |
| <b>Modifiable</b>          | <code>ALTER SYSTEM</code>                                                                                                                                                                                  |
| <b>Modifiable in a PDB</b> | No                                                                                                                                                                                                         |
| <b>Range of values</b>     | Any ASCII string or comma-separated list of string names                                                                                                                                                   |
| <b>Basic</b>               | No                                                                                                                                                                                                         |
| <b>Oracle RAC</b>          | Do not set the <code>SERVICE_NAMES</code> parameter for Oracle RAC environments. Instead, define services using Oracle Enterprise Manager and manage those services using Server Control (SRVCTL) utility. |

The instance registers its service names with the listener. When a client requests a service, the listener determines which instances offer the requested service and routes the client to the appropriate instance.

You can specify multiple service names to distinguish among different uses of the same database. For example:

```
SERVICE_NAMES = sales.example.com, widgetsales.example.com
```

You can also use service names to identify a single service that is available from two different databases through the use of replication.

If you do not qualify the names in this parameter with a domain, Oracle qualifies them with the value of the `DB_DOMAIN` parameter. If `DB_DOMAIN` is not specified, then no domain will be applied to the non-qualified `SERVICE_NAMES` values.

When you specify additional service names with this parameter, the default service name is not overridden. The default service name plus the additional service names specified with this parameter are the service names that clients can use to connect to the database.

 **Note:**

The `SERVICE_NAMES` initialization parameter is deprecated in Oracle Database 19c and may be desupported in a future release.

Use of the `SERVICE_NAMES` parameter is no longer actively supported. It must not be used for high availability (HA) deployments and it is not supported for HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

To manage your services, Oracle recommends that you instead use the `SRVCTL` command-line utility, the `GDSCCTL` command-line utility, or the `DBMS_SERVICE` PL/SQL package.

 **See Also:**

- *Oracle Database Net Services Administrator's Guide* for more information on this parameter and its settings
- *Oracle Real Application Clusters Administration and Deployment Guide* for information about services administration in an Oracle RAC environment
- ["DB\\_DOMAIN"](#)

## 2.357 SESSION\_CACHED\_CURSORS

`SESSION_CACHED_CURSORS` specifies the number of session cursors to cache.

| Property            | Description                                   |
|---------------------|-----------------------------------------------|
| Parameter type      | Integer                                       |
| Default value       | 50                                            |
| Modifiable          | ALTER SESSION, ALTER SYSTEM ... DEFERRED      |
| Modifiable in a PDB | Yes                                           |
| Range of values     | 0 to operating system-dependent               |
| Basic               | No                                            |
| Oracle RAC          | Multiple instances can have different values. |

Repeated parse calls of the same SQL (including recursive SQL) or PL/SQL statement cause the session cursor for that statement to be moved into the session cursor cache. Oracle uses a least recently used algorithm to remove entries in the session cursor cache to make room for new entries when needed.

 **See Also:**

*Oracle Database Performance Tuning Guide* for information about enabling the session cursor cache

## 2.358 SESSION\_EXIT\_ON\_PACKAGE\_STATE\_ERROR

Use `SESSION_EXIT_ON_PACKAGE_STATE_ERROR` to force a hard session exit when a session's state has been invalidated.

Exiting sessions after state invalidation avoids errors that can occur when applications mishandle an invalid state.

| Property            | Description                                   |
|---------------------|-----------------------------------------------|
| Parameter type      | Boolean                                       |
| Default value       | FALSE                                         |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                   |
| Modifiable in a PDB | Yes                                           |
| Range of values     | TRUE   FALSE                                  |
| Basic               | No                                            |
| Oracle RAC          | Different instances can use different values. |

Set `SESSION_EXIT_ON_PACKAGE_STATE_ERROR` to `TRUE` to force a hard session exit under the following circumstances:

- When a stateful PL/SQL package undergoes modification, the sessions that have an active instantiation of the package receive an `ORA-4068` error when they attempt to run it. When `SESSION_EXIT_ON_PACKAGE_STATE_ERROR` is set to `TRUE`, the session immediately exits instead of raising `ORA-04068`. This can be advantageous because many applications are better equipped to handle a session being discarded, and failing to catch errors related to session state, such as `ORA-04068`, can lead to silent data corruption.
- When an Oracle Database Multilingual Engine (MLE) module or environment is modified via DDL, sessions that have an active instantiation of the object receive an `ORA-4106` or `ORA-4107` error. Setting `SESSION_EXIT_ON_PACKAGE_STATE_ERROR` to `TRUE` forces sessions to be disconnected if the session state is invalidated. Because many applications capture session disconnect, this option can help simplify the recovery from the invalidation of an existing session state.

 **Note:**

This parameter is available starting with Oracle Database 23ai.

## 2.359 SESSION\_MAX\_OPEN\_FILES

`SESSION_MAX_OPEN_FILES` specifies the maximum number of BFILEs that can be opened in any session. Once this number is reached, subsequent attempts to open more files in the session by using `DBMS_LOB.FILEOPEN()` or `OCIlobFileOpen()` will fail. The maximum value for this parameter depends on the equivalent parameter defined for the underlying operating system.

| Property            | Description                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------|
| Parameter type      | Integer                                                                                                             |
| Default value       | 10                                                                                                                  |
| Modifiable          | No                                                                                                                  |
| Modifiable in a PDB | No                                                                                                                  |
| Range of values     | 1 to either 50 or the value of <code>MAX_OPEN_FILES</code> defined at the operating system level, whichever is less |
| Basic               | No                                                                                                                  |

## 2.360 SESSIONS

`SESSIONS` specifies the maximum number of sessions that can be created in the system.

| Property            | Description                                                                                                                                                                                                                                                                |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | Integer                                                                                                                                                                                                                                                                    |
| Default value       | Derived: $(1.5 * PROCESSES) + 22$                                                                                                                                                                                                                                          |
| Modifiable          | <code>ALTER SYSTEM</code> can be used in a PDB only to change the value of the <code>SESSIONS</code> parameter for that PDB.<br><code>ALTER SYSTEM</code> <i>cannot</i> be used to change the value of the <code>SESSIONS</code> parameter in a non-CDB or in a CDB\$ROOT. |
| Modifiable in a PDB | Yes                                                                                                                                                                                                                                                                        |
| Range of values     | 1 to $2^{16}$ (which is 1 to 65536)                                                                                                                                                                                                                                        |
| Basic               | Yes                                                                                                                                                                                                                                                                        |

Because every login requires a session, this parameter effectively determines the maximum number of concurrent users in the system. You should always set this parameter explicitly to a value equivalent to your estimate of the maximum number of concurrent users, plus the number of background processes, plus approximately 10% for recursive sessions.

Oracle uses the default value of this parameter as its minimum. Values between 1 and the default do not trigger errors, but Oracle ignores them and uses the default instead.

The default values of the `ENQUEUE_RESOURCES` and `TRANSACTIONS` parameters are derived from `SESSIONS`. Therefore, if you increase the value of `SESSIONS`, you should consider whether to adjust the values of `ENQUEUE_RESOURCES` and `TRANSACTIONS` as well. (Note that `ENQUEUE_RESOURCES` is obsolete as of Oracle Database 10g release 2 (10.2).)

In a shared server environment, the value of `PROCESSES` can be quite small. Therefore, Oracle recommends that you adjust the value of `SESSIONS` to approximately  $1.1 \times$  total number of *connections*.

For a CDB, the root container's `SESSIONS` parameter specifies the total number of sessions for the database.

The `SESSIONS` parameter for a PDB specifies the total number of sessions that can be used by that PDB. Its value defaults to the root container's `SESSIONS` value. If the PDB tries to use more sessions than configured by its `SESSIONS` parameter, an `ORA-00018` error message is generated. For PDBs, the `SESSIONS` parameter does not count recursive sessions and hence does not require the 10% adjustment.

The `SESSIONS` parameter for a PDB can only be modified by the PDB. It cannot be set higher than the CDB's `SESSIONS` value.

## 2.361 SGA\_MAX\_SIZE

`SGA_MAX_SIZE` specifies the maximum size of the SGA for the lifetime of the instance.

| Property                   | Description                                                                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                                                                                                     |
| <b>Syntax</b>              | <code>SGA_MAX_SIZE = integer [K   M   G]</code>                                                                                                 |
| <b>Default value</b>       | Initial size of SGA at startup, dependent on the sizes of different pools in the SGA, such as buffer cache, shared pool, large pool, and so on. |
| <b>Modifiable</b>          | No                                                                                                                                              |
| <b>Modifiable in a PDB</b> | No                                                                                                                                              |
| <b>Range of values</b>     | 0 to operating system-dependent                                                                                                                 |

On 64-bit platforms and non-Windows 32-bit platforms, when either `MEMORY_TARGET` or `MEMORY_MAX_TARGET` is specified, the default value of `SGA_MAX_SIZE` is set to the larger of the two parameters. This causes more address space to be reserved for expansion of the SGA.

On Windows 32-bit platforms, the default value of `SGA_MAX_SIZE` is the largest of the following values:

- 60% of `MEMORY_TARGET`, if specified
- 60% of `MEMORY_MAX_TARGET`, if specified
- 25% of the total available virtual address space

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this parameter

## 2.362 SGA\_MIN\_SIZE

`SGA_MIN_SIZE` indicates a possible minimum value for SGA usage of a pluggable database (PDB).

| Property                   | Description                                     |
|----------------------------|-------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                     |
| <b>Syntax</b>              | <code>SGA_MIN_SIZE = integer [K   M   G]</code> |
| <b>Default value</b>       | 0                                               |
| <b>Modifiable</b>          | ALTER SYSTEM                                    |
| <b>Modifiable in a PDB</b> | Yes                                             |
| <b>Range of values</b>     | 0 to 50% of <code>SGA_TARGET</code>             |
| <b>Basic</b>               | No                                              |
| <b>Oracle RAC</b>          | The same value must be used for all instances.  |

Setting this parameter at the CDB level has no effect.

**Note:**

To be able to use Resource Manager in a CDB to control the amount of memory each PDB can use:

- The `NONCDB_COMPATIBLE` initialization parameter must be set to `FALSE` at the CDB level (in the root of the CDB).
- The `MEMORY_TARGET` initialization parameter must not be set at the CDB level.
- A value for `SGA_TARGET` must be set at the CDB level.

If `SGA_TARGET` is not set at the CDB level, then setting `SGA_MIN_SIZE` in a PDB has no effect. You will not receive an error message, and the PDB's `SGA_MIN_SIZE` value will not be enforced.

- You must set the `SGA_MIN_SIZE` value to a value that meets these requirements:
  - In a PDB, to a value that is less than or equal to 50% of the value of `SGA_TARGET` in the PDB
  - In a PDB, to a value that is less than or equal to 50% of the value of `SGA_TARGET` at the CDB level
  - In a PDB, to a value that is less than the value of `SGA_MAX_SIZE` at the CDB level
  - Across all the open PDBs in a CDB, the sum of `SGA_MIN_SIZE` values must be less than or equal to 50% of the managed SGA total at the CDB level. Managed SGA is `DB_CACHE_SIZE` plus `SHARED_POOL_SIZE`.

When you set `SGA_MIN_SIZE` in a PDB to a value that does not meet these requirements, you receive an error.

**See Also:**

*Oracle Multitenant Administrator's Guide* for more information about the initialization parameters that control the memory usage of PDBs

## 2.363 SGA\_TARGET

`SGA_TARGET` specifies the total size of all SGA components.

| Property            | Description                                                                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | Big integer                                                                                                                                        |
| Syntax              | <code>SGA_TARGET = integer [K   M   G]</code>                                                                                                      |
| Default value       | 0 (SGA autotuning is disabled for <code>DEFERRED</code> mode autotuning requests, but allowed for <code>IMMEDIATE</code> mode autotuning requests) |
| Modifiable          | <code>ALTER SYSTEM</code>                                                                                                                          |
| Modifiable in a PDB | Yes                                                                                                                                                |

| Property        | Description                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Range of values | 64 MB to SGA_MAX_SIZE<br><br>Note that if MEMORY_MAX_TARGET > 0, then the value of SGA_TARGET also cannot exceed the value of MEMORY_MAX_TARGET. |
| Basic           | Yes                                                                                                                                              |

If SGA\_TARGET is specified, then the following memory pools are automatically sized:

- Buffer cache (DB\_CACHE\_SIZE)
- Shared pool (SHARED\_POOL\_SIZE)
- Large pool (LARGE\_POOL\_SIZE)
- Java pool (JAVA\_POOL\_SIZE)
- Streams pool (STREAMS\_POOL\_SIZE)
- Data transfer cache (DATA\_TRANSFER\_CACHE\_SIZE)

If these automatically tuned memory pools are set to nonzero values, then those values are used as minimum levels by Automatic Shared Memory Management. You would set minimum values if an application component needs a minimum amount of memory to function properly.

The following pools are manually sized components and are not affected by Automatic Shared Memory Management:

- Log buffer
- Other buffer caches, such as KEEP, RECYCLE, and other block sizes
- Fixed SGA and other internal allocations

The memory allocated to these pools is deducted from the total available for SGA\_TARGET when Automatic Shared Memory Management computes the values of the automatically tuned memory pools.

In the **Default value** field, IMMEDIATE mode autotuning requests are necessary to avoid ORA-04031 errors. The DEFERRED and IMMEDIATE modes are reflected in the OPER\_MODE column of the V\$MEMORY\_RESIZE\_OPS view.

If Automatic Memory Management is enabled (MEMORY\_TARGET is set to a positive value) and SGA\_TARGET is also set to a positive value, the SGA\_TARGET value acts as the minimum value for the size of the SGA.

 **Note:**

This parameter is optional for pluggable databases (PDBs). When this parameter is set for a PDB, it specifies the maximum SGA that the PDB can use at any time. When this parameter is not set at the PDB level, the PDB has no limit for the amount of SGA it can use, other than the CDB's SGA size.

To be able to use Resource Manager in a CDB to control the amount of memory each PDB can use:

- The `NONCDB_COMPATIBLE` initialization parameter must be set to `FALSE` at the CDB level (in the root of the CDB).
- The `MEMORY_TARGET` initialization parameter must not be set at the CDB level.
- You must set the `SGA_TARGET` initialization parameter at the CDB level.
- You must set `SGA_TARGET` in a PDB.

If you set a PDB's `SGA_TARGET` value and `SGA_TARGET` is not set at the CDB level, you will not receive an error message and the PDB's `SGA_TARGET` value will not be enforced.

- When setting `SGA_TARGET` in a PDB, the following requirements must be met:
  - The value of `SGA_TARGET` in the PDB must be less than or equal to the `SGA_TARGET` value at the CDB level.
  - The value of `SGA_TARGET` in the PDB must be less than or equal to the `SGA_MAX_SIZE` value at the CDB level.
  - The value of `SGA_TARGET` in the PDB must be twice the PDB's `DB_CACHE_SIZE` value, if the PDB's `DB_CACHE_SIZE` value is set.
  - The value of `SGA_TARGET` in the PDB must be twice the PDB's `SHARED_POOL_SIZE` value, if the PDB's `SHARED_POOL_SIZE` value is set.
  - The value of `SGA_TARGET` in the PDB must be twice the PDB's `SGA_MIN_SIZE` value, if the PDB's `SGA_MIN_SIZE` value is set.

When you set `SGA_TARGET` in a PDB to a value that does not meet these requirements, you receive an error.

## 2.364 SHADOW\_CORE\_DUMP

SHADOW\_CORE\_DUMP specifies whether Oracle includes the SGA in the core file for foreground (client) processes.

| Property                   | Description                                     |
|----------------------------|-------------------------------------------------|
| <b>Parameter type</b>      | String                                          |
| <b>Syntax</b>              | SHADOW_CORE_DUMP = { partial   full   none }    |
| <b>Default value</b>       | partial. On Windows, the default value is none. |
| <b>Modifiable</b>          | ALTER SYSTEM                                    |
| <b>Modifiable in a PDB</b> | Yes                                             |
| <b>Basic</b>               | No                                              |

**Values**

- `partial`  
Oracle does not include the SGA in the core dump.
- `full`  
Oracle includes the SGA in the core dump.
- `none`  
No core files will be generated for foreground processes.

## 2.365 SHARD\_ENABLE\_RAFT\_FOLLOWER\_READ

Use `SHARD_ENABLE_RAFT_FOLLOWER_READ` to enable or disable reads from follower replication units in a shard.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Boolean                     |
| <b>Default value</b>       | false                       |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | true   false                |
| <b>Basic</b>               | No                          |

**Note:**

This parameter is available starting with Oracle Database 23ai.

## 2.366 SHARD\_RAFT\_LOGFILE\_SIZE

`SHARD_RAFT_LOGFILE_SIZE` specifies (in bytes) the size of Raft log files.

| Property                   | Description                                                |
|----------------------------|------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                |
| <b>Syntax</b>              | <code>SHARD_RAFT_LOGFILE_SIZE = integer [K   M   G]</code> |
| <b>Default value</b>       | 1G                                                         |
| <b>Modifiable</b>          | ALTER SYSTEM                                               |
| <b>Modifiable in a PDB</b> | Yes                                                        |
| <b>Range of values</b>     | 0 to operating system-dependent                            |
| <b>Basic</b>               | No                                                         |
| <b>Oracle RAC</b>          | Different instances can use different values.              |

Each replication unit (RU) has 3 Raft log files. Therefore, the log capacity of an RU is 3 times the value of this parameter.

When you modify the value of this parameter in the current instance, the change takes effect the first time a Raft log file is subsequently overwritten.

**Note:**

This parameter is available starting with Oracle Database 23ai.

## 2.367 SHARED\_MEMORY\_ADDRESS

`SHARED_MEMORY_ADDRESS` and `HI_SHARED_MEMORY_ADDRESS` specify the starting address at run time of the system global area (SGA). This parameter is ignored on the many platforms that specify the SGA's starting address at linktime.

| Property                   | Description |
|----------------------------|-------------|
| <b>Parameter type</b>      | Integer     |
| <b>Default value</b>       | 0           |
| <b>Modifiable</b>          | No          |
| <b>Modifiable in a PDB</b> | No          |
| <b>Basic</b>               | No          |

Use this parameter to specify the entire address on 32-bit platforms and to specify the low-order 32 bits of a 64-bit address on 64-bit platforms. Use `HI_SHARED_MEMORY_ADDRESS` to specify the high-order 32 bits of a 64-bit address on 64-bit platforms. If both parameters are 0 or unspecified, the SGA address defaults to a platform-specific location.

**See Also:**

["HI\\_SHARED\\_MEMORY\\_ADDRESS"](#)

## 2.368 SHARED\_POOL\_RESERVED\_SIZE

`SHARED_POOL_RESERVED_SIZE` specifies (in bytes) the shared pool space that is reserved for large contiguous requests for shared pool memory.

| Property                   | Description                                                                  |
|----------------------------|------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                                  |
| <b>Syntax</b>              | <code>SHARED_POOL_RESERVED_SIZE = integer [K   M   G]</code>                 |
| <b>Default value</b>       | 5% of the value of <code>SHARED_POOL_SIZE</code>                             |
| <b>Modifiable</b>          | No                                                                           |
| <b>Modifiable in a PDB</b> | No                                                                           |
| <b>Range of values</b>     | Minimum: 5000<br>Maximum: half of the value of <code>SHARED_POOL_SIZE</code> |
| <b>Basic</b>               | No                                                                           |

You can use this parameter to avoid performance degradation in the shared pool in situations where pool fragmentation forces Oracle to search for and free chunks of unused pool to satisfy the current request.

**See Also:**

- ["SHARED\\_POOL\\_SIZE"](#)
- *Oracle Database Performance Tuning Guide* for information on sizing the shared pool

## 2.369 SHARED\_POOL\_SIZE

SHARED\_POOL\_SIZE specifies (in bytes) the size of the shared pool.

| Property                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Syntax</b>              | SHARED_POOL_SIZE = <i>integer</i> [K   M   G]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default value</b>       | If SGA_TARGET is set: If the parameter is not specified, then the default is 0 (internally determined by the Oracle Database). If the parameter is specified, then the user-specified value indicates a minimum value for the memory pool.<br><br>If SGA_TARGET is not set (32-bit platforms): 64 MB, rounded up to the nearest granule size.<br><br>If SGA_TARGET is not set (64-bit platforms): 128 MB, rounded up to the nearest granule size.<br><br>For considerations when dealing with database instances using Oracle ASM, see <a href="#">"SHARED_POOL_SIZE and Automatic Storage Management"</a> . |
| <b>Modifiable</b>          | ALTER SYSTEM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Range of values</b>     | Minimum: the granule size<br>Maximum: operating system-dependent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Basic</b>               | No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

The shared pool contains shared cursors, stored procedures, control structures, and other structures. If SGA\_TARGET is not set, then Oracle also allocates parallel execution message buffers from the shared pool. Larger values improve performance in multiuser systems. Smaller values use less memory.

You can monitor utilization of the shared pool by querying the view V\$SGASTAT.

 **Note:**

This parameter is optional for pluggable databases (PDBs). When this parameter is set for a PDB, it indicates a possible minimum value for the PDB usage of the memory pool.

To be able to use Resource Manager in a CDB to control the amount of memory each PDB can use:

- The `NONCDB_COMPATIBLE` initialization parameter must be set to `FALSE` at the CDB level (in the root of the CDB).
- The `MEMORY_TARGET` initialization parameter must not be set at the CDB level.
- If the `SGA_TARGET` initialization parameter is set at the CDB level, then the following requirement must be met:
  - The value of `SHARED_POOL_SIZE` set in a PDB must be less than or equal to 50% of the `SGA_TARGET` value at the CDB level.
- If the `SGA_TARGET` initialization parameter is set at the PDB level, then the following requirement must be met:
  - The value of `SHARED_POOL_SIZE` set in a PDB must be less than or equal to 50% of the `SGA_TARGET` value at the PDB level.
- If the `SGA_TARGET` initialization parameter is not set, but the `SHARED_POOL_SIZE` initialization parameter is set at the CDB level, then the following requirement must be met:
  - The value of `SHARED_POOL_SIZE` set in a PDB must be less than or equal to 50% of the `SHARED_POOL_SIZE` value at the CDB level.

When you set `SHARED_POOL_SIZE` in a PDB to a value that does not meet these requirements, you receive an error.

## SHARED\_POOL\_SIZE and Automatic Storage Management

On a database instance using Oracle Automatic Storage Management (Oracle ASM), additional memory is required to store extent maps. As a general guideline, you can aggregate the values from the following queries to obtain current database storage size that is either already on Oracle ASM or will be stored in Oracle ASM. Then determine the redundancy type that is used (or will be used), and calculate the value for `SHARED_POOL_SIZE`, using the aggregated value as input.

```
SELECT SUM(BYTES)/(1024*1024*1024) FROM V$DATAFILE;
SELECT SUM(BYTES)/(1024*1024*1024) FROM V$LOGFILE a, V$LOG b
WHERE a.group#=b.group#;
SELECT SUM(BYTES)/(1024*1024*1024) FROM V$TEMPFILE WHERE
status='ONLINE';
```

Additionally, keep the following guidelines in mind:

- For disk groups using external redundancy:  
(Every 100G of space needs 1M of extra shared pool) + 2M
- For disk groups using normal redundancy:  
(Every 50G of space needs 1M of extra shared pool) + 4M
- For disk groups using high redundancy:  
(Every 33G of space needs 1M of extra shared pool) + 6M

## 2.370 SHARED\_SERVER\_SESSIONS

SHARED\_SERVER\_SESSIONS specifies the total number of shared server sessions to allow.

| Property            | Description                                                                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parameter type      | Integer                                                                                                                                                                                                        |
| Default value       | There is no default value.                                                                                                                                                                                     |
| Modifiable          | ALTER SYSTEM                                                                                                                                                                                                   |
| Modifiable in a PDB | No                                                                                                                                                                                                             |
| Range of values     | If SHARED_SERVER_SESSIONS is specified, then it should be less than SESSIONS. If SHARED_SERVER_SESSIONS is not specified, then a shared server session may be created as long as there is a free session slot. |
| Basic               | No                                                                                                                                                                                                             |

Setting this parameter enables you to reserve user sessions for dedicated servers.

### See Also:

*Oracle Database Concepts* for more information on sessions

## 2.371 SHARED\_SERVERS

SHARED\_SERVERS specifies the number of server processes that you want to create when an instance is started. If system load decreases, then this minimum number of servers is maintained. Therefore, you should take care not to set SHARED\_SERVERS too high at system startup.

| Property       | Description |
|----------------|-------------|
| Parameter type | Integer     |

| Property                   | Description                                                                                                                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default value</b>       | 0, meaning that shared server is not on.<br><br>If you are using shared server architecture or if the <code>DISPATCHERS</code> parameter is set such that the total number of dispatchers is more than 0, then the default value is 1.                                          |
| <b>Modifiable</b>          | <code>ALTER SYSTEM</code>                                                                                                                                                                                                                                                       |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                                                                                             |
| <b>Range of values</b>     | The value of this parameter should be less than <code>MAX_SHARED_SERVERS</code> . If it is greater than or equal to <code>MAX_SHARED_SERVERS</code> , then the number of servers will not be self-tuned but will remain constant, as specified by <code>SHARED_SERVERS</code> . |
| <b>Basic</b>               | Yes                                                                                                                                                                                                                                                                             |

Starting with Oracle Database 12c Release 1 (12.1.0.2), the `SHARED_SERVERS` parameter can be set on PDBs. However, unlike most other parameters that can be set on a PDB, this parameter can only be used within a PDB to enable or disable use of shared servers for that PDB. Therefore, in a PDB, the DBA can either set `SHARED_SERVERS` to 0 to disable use of shared servers for that PDB or use `ALTER SYSTEM RESET SHARED_SERVERS` to re-enable shared servers for the PDB. The configuration of shared servers for the CDB can only be done in the root.

- *Oracle Database Administrator's Guide* for more information on setting this parameter

## 2.372 SHRD\_DUPL\_TABLE\_REFRESH\_RATE

`SHRD_DUPL_TABLE_REFRESH_RATE` displays the duplicated table refresh rate (in seconds).

| Property                   | Description                                            |
|----------------------------|--------------------------------------------------------|
| <b>Parameter type</b>      | Integer                                                |
| <b>Default value</b>       | 60                                                     |
| <b>Modifiable</b>          | <code>ALTER SESSION</code> , <code>ALTER SYSTEM</code> |
| <b>Modifiable in a PDB</b> | Yes                                                    |
| <b>Range of values</b>     | 20 to $2^{31} - 1$                                     |
| <b>Basic</b>               | No                                                     |
| <b>Oracle RAC</b>          | All instances should use the same instance.            |

You can change the value of this parameter to change the duplicated table refresh rate.

A duplicated table is a table that has the same contents on all shards in a sharded database. Duplicated tables are implemented using materialized views that are refreshed at a certain rate.

 **See Also:**

- *Oracle Globally Distributed Database Guide* for an introduction to sharding
- *Oracle Globally Distributed Database Guide* for more information about duplicated tables

## 2.373 SKIP\_UNUSABLE\_INDEXES

SKIP\_UNUSABLE\_INDEXES enables or disables the use and reporting of tables with unusable indexes or index partitions.

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Parameter type</b>      | Boolean                     |
| <b>Default value</b>       | true                        |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | true   false                |
| <b>Basic</b>               | No                          |

If a SQL statement uses a hint that forces the usage of an unusable index, then this hint takes precedence over initialization parameter settings, including SKIP\_UNUSABLE\_INDEXES. If the optimizer chooses an unusable index, then an ORA-01502 error will result. (See *Oracle Database Administrator's Guide* for more information about using hints.)

### Values

- true

Disables error reporting of indexes and index partitions marked UNUSABLE. This setting allows all operations (inserts, deletes, updates, and selects) on tables with unusable indexes or index partitions.

 **Note:**

If an index is used to enforce a UNIQUE constraint on a table, then allowing insert and update operations on the table might violate the constraint. Therefore, this setting does not disable error reporting for unusable indexes that are unique.

- false

Enables error reporting of indexes marked UNUSABLE. This setting does not allow inserts, deletes, and updates on tables with unusable indexes or index partitions.

**See Also:**

*Oracle Database SQL Language Reference* for more information about hints

## 2.374 SMTP\_OUT\_SERVER

SMTP\_OUT\_SERVER specifies the SMTP host and port to which UTL\_MAIL delivers out-bound E-mail.

| Property                   | Description                                                          |
|----------------------------|----------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                               |
| <b>Syntax</b>              | SMTP_OUT_SERVER = <i>server_clause</i> [, <i>server_clause</i> ] ... |
| <b>Syntax</b>              | <b>server_clause</b> ::=<br><i>host_name</i> [: <i>port</i> ]        |
| <b>Default value</b>       | There is no default value.                                           |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                          |
| <b>Modifiable in a PDB</b> | Yes                                                                  |
| <b>Basic</b>               | No                                                                   |

Multiple servers may be specified, separated by commas.

If the first server in the list is unavailable, then UTL\_MAIL tries the second server, and so on.

If SMTP\_OUT\_SERVER is not specified, then the SMTP server name defaults to the value of DB\_DOMAIN, the port number defaults to 25, and the SMTP domain defaults to the suffix of DB\_DOMAIN.

**See Also:**

*Oracle Database PL/SQL Packages and Types Reference* for information on the UTL\_MAIL package

## 2.375 SORT\_AREA\_RETAINED\_SIZE

SORT\_AREA\_RETAINED\_SIZE specifies (in bytes) the maximum amount of the user global area (UGA) memory retained after a sort run completes. The retained size controls the size of the read buffer, which Oracle uses to maintain a portion of the sort in memory. This memory is released back to the UGA, not to the operating system, after the last row is fetched from the sort space.

| Property              | Description                              |
|-----------------------|------------------------------------------|
| <b>Parameter type</b> | Integer                                  |
| <b>Default value</b>  | Derived from SORT_AREA_SIZE              |
| <b>Modifiable</b>     | ALTER SESSION, ALTER SYSTEM ... DEFERRED |

| Property            | Description                                                                     |
|---------------------|---------------------------------------------------------------------------------|
| Modifiable in a PDB | Yes                                                                             |
| Range of values     | From the value equivalent of two database blocks to the value of SORT_AREA_SIZE |
| Basic               | No                                                                              |

**Note:**

Oracle does not recommend using the `SORT_AREA_RETAINED_SIZE` parameter unless the instance is configured with the shared server option. Oracle recommends that you enable automatic sizing of SQL working areas by setting `PGA_AGGREGATE_TARGET` instead. `SORT_AREA_RETAINED_SIZE` is retained for backward compatibility.

Oracle may allocate multiple sort spaces of this size for each query. Usually, only one or two sorts occur simultaneously, even for complex queries. In some cases, however, additional concurrent sorts are required, and each sort keeps its own memory area. If the shared server is used, allocation is to the SGA until the value in `SORT_AREA_RETAINED_SIZE` is reached. The difference between `SORT_AREA_RETAINED_SIZE` and `SORT_AREA_SIZE` is allocated to the PGA.

**Note:**

The default value as reflected in the `V$PARAMETER` dynamic performance view is 0. However, if you do not explicitly set this parameter, Oracle actually uses the value of the `SORT_AREA_SIZE` parameter.

**See Also:**

- ["SORT\\_AREA\\_SIZE"](#)
- *Oracle Database Performance Tuning Guide* for information on setting the values of this parameter and the `SORT_AREA_SIZE` parameter to tune sort operations using shared servers

## 2.376 SORT\_AREA\_SIZE

`SORT_AREA_SIZE` specifies (in bytes) the maximum amount of memory Oracle will use for a sort.

| Property            | Description                              |
|---------------------|------------------------------------------|
| Parameter type      | Integer                                  |
| Default value       | 65536                                    |
| Modifiable          | ALTER SESSION, ALTER SYSTEM ... DEFERRED |
| Modifiable in a PDB | Yes                                      |

| Property        | Description                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------|
| Range of values | Minimum: the value equivalent of six database blocks<br>Maximum: operating system-dependent |
| Basic           | No                                                                                          |

**Note:**

Oracle does not recommend using the `SORT_AREA_SIZE` parameter unless the instance is configured with the shared server option. Oracle recommends that you enable automatic sizing of SQL working areas by setting `PGA_AGGREGATE_TARGET` instead. `SORT_AREA_SIZE` is retained for backward compatibility.

After the sort is complete, but before the rows are returned, Oracle releases all of the memory allocated for the sort, except the amount specified by the `SORT_AREA_RETAINED_SIZE` parameter. After the last row is returned, Oracle releases the remainder of the memory.

Increasing `SORT_AREA_SIZE` size improves the efficiency of large sorts.

Each sort in a query can consume memory up to the amount specified by `SORT_AREA_SIZE`, and there can be multiple sorts in a query. Also, if a query is executed in parallel, each PX server can consume memory up to the amount specified by `SORT_AREA_SIZE` for each sort it does.

`SORT_AREA_SIZE` is also used for inserts and updates to bitmap indexes. Setting this value appropriately results in a bitmap segment being updated only once for each DML operation, even if more than one row in that segment changes.

Larger values of `SORT_AREA_SIZE` permit more sorts to be performed in memory. If more space is required to complete the sort than will fit into the memory provided, then temporary segments on disk are used to hold the intermediate sort runs.

The default is adequate for most OLTP operations. You might want to adjust this parameter for decision support systems, batch jobs, or large `CREATE INDEX` operations.

**See Also:**

- *Oracle Database Concepts* for information on sort areas
- Your operating system-specific Oracle documentation for the default value on your system
- "[SORT\\_AREA\\_RETAINED\\_SIZE](#)"

## 2.377 SPATIAL\_VECTOR\_ACCELERATION

`SPATIAL_VECTOR_ACCELERATION` enables or disables the spatial vector acceleration.

| Property            | Description                                  |
|---------------------|----------------------------------------------|
| Parameter type      | Boolean                                      |
| Default value       | true                                         |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                  |
| Modifiable in a PDB | Yes                                          |
| Range of values     | true   false                                 |
| Basic               | No                                           |
| Oracle RAC          | Multiple instances should use the same value |

The setting of `true` for this parameter improves spatial vector query performance.

#### See Also:

*Oracle Spatial Developer's Guide* for more information about this parameter

## 2.378 SPFILE

The value of this parameter is the name of the current server parameter file (`SPFILE`) in use.

| Property            | Description                                    |
|---------------------|------------------------------------------------|
| Parameter type      | String                                         |
| Syntax              | <code>SPFILE = spfile_name</code>              |
| Default value       | <code>ORACLE_BASE_CONFIG/dbs/spfile.ora</code> |
| Modifiable          | No                                             |
| Modifiable in a PDB | No                                             |
| Range of values     | Any valid <code>SPFILE</code>                  |
| Basic               | No                                             |
| Oracle RAC          | Multiple instances must have the same value.   |

This parameter can be defined in a client side `PFILE` to indicate the name of the server parameter file to use.

When the default server parameter file is used by the server, the value of `SPFILE` is internally set by the server.

The `SPFILE` resides in the `ORACLE_BASE_CONFIG/dbs` directory; however, users can place it anywhere on their system as long as it is specified in an initialization parameter file.

#### See Also:

*Oracle Database Administrator's Guide* for more information about creating the server parameter file

## 2.379 SQL\_ERROR\_MITIGATION

Use `SQL_ERROR_MITIGATION` to enable or disable automatic error mitigation for SQL statements.

| Property                   | Description                                      |
|----------------------------|--------------------------------------------------|
| <b>Parameter type</b>      | String                                           |
| <b>Syntax</b>              | <code>SQL_ERROR_MITIGATION = { ON   OFF }</code> |
| <b>Default value</b>       | ON                                               |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                      |
| <b>Modifiable in a PDB</b> | Yes                                              |
| <b>Basic</b>               | No                                               |
| <b>Oracle RAC</b>          | Different instances can use different values.    |

Set this parameter to `ON` to enable automatic error mitigation for SQL statements; set it to `OFF` to disable automatic error mitigation for SQL statements.

### Note:

This parameter is available starting with Oracle Database 23ai.

## 2.380 SQL\_HISTORY\_ENABLED

Use `SQL_HISTORY_ENABLED` to enable or disable SQL history monitoring.

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Parameter type</b>      | Boolean                                       |
| <b>Default value</b>       | false                                         |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                   |
| <b>Modifiable in a PDB</b> | Yes                                           |
| <b>Range of values</b>     | true   false                                  |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Different instances can use different values. |

To enable SQL history monitoring, set this parameter to `true`. This feature monitors user-issued SQL statements in each user session on a best effort, depending on memory capacity. DDL, DML, and query statements are monitored; SQL statements issued in the background and recursive SQL statements are excluded. The monitored information is exposed by the `V$SQL_HISTORY` dynamic performance view.

To disable SQL history monitoring, set this parameter to `false`.

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

"V\$SQL\_HISTORY"

## 2.381 SQL\_TRACE

SQL\_TRACE enables or disables the SQL trace facility.

| Property            | Description                 |
|---------------------|-----------------------------|
| Parameter type      | Boolean                     |
| Default value       | false                       |
| Modifiable          | ALTER SESSION, ALTER SYSTEM |
| Modifiable in a PDB | Yes                         |
| Range of values     | true   false                |
| Basic               | No                          |

Setting this parameter to `true` provides information on tuning that you can use to improve performance.

**Note:**

Using this initialization parameter to enable the SQL trace facility for the entire instance can have a severe performance impact. Enable the facility for specific sessions using the `ALTER SESSION` statement. If you must enable the facility on an entire production environment, then you can minimize performance impact by:

- Maintaining at least 25% idle CPU capacity
- Maintaining adequate disk space for the `USER_DUMP_DEST` location
- Striping disk space over sufficient disks

**Note:**

The `SQL_TRACE` parameter is deprecated. Oracle recommends that you use the `DBMS_MONITOR` and `DBMS_SESSION` packages instead. `SQL_TRACE` is retained for backward compatibility only.

 **See Also:**

- `"USER_DUMP_DEST"`
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_MONITOR` package
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_SESSION` package
- *Oracle Database Performance Tuning Guide* for more information about performance diagnostic tools

## 2.382 SQL\_TRANSPILER

`SQL_TRANSPILER` enables or disables the SQL Transpiler.

| Property            | Description                                   |
|---------------------|-----------------------------------------------|
| Parameter type      | String                                        |
| Syntax              | <code>SQL_TRANSPILER = { ON   OFF }</code>    |
| Default value       | <code>OFF</code>                              |
| Modifiable          | <code>ALTER SESSION, ALTER SYSTEM</code>      |
| Modifiable in a PDB | Yes                                           |
| Basic               | No                                            |
| Oracle RAC          | Different instances can use different values. |

When this parameter is set to `ON`, the SQL Transpiler feature is enabled and PL/SQL functions are automatically transpiled into SQL expressions whenever possible, without user intervention. When this parameter is set to `OFF`, the SQL Transpiler feature is disabled.

 **Note:**

This parameter is available starting with Oracle Database 23ai.

## 2.383 SQL92\_SECURITY

`SQL92_SECURITY` specifies whether users must have been granted the `SELECT` privilege on a table to execute an `UPDATE` or `DELETE` statement that references table column values in a `WHERE` or `SET` clause.

| Property            | Description       |
|---------------------|-------------------|
| Parameter type      | Boolean           |
| Default value       | <code>true</code> |
| Modifiable          | No                |
| Modifiable in a PDB | Yes               |

| Property        | Description  |
|-----------------|--------------|
| Range of values | true   false |
| Basic           | No           |

The SQL standard specifies that security administrators should be able to require that users have `SELECT` privilege on a table when executing an `UPDATE` or `DELETE` statement that references table column values in a `WHERE` or `SET` clause.

#### Values

- true

The user must have `SELECT` privilege on a column to reference it in the `WHERE` clause of a `DELETE` or `UPDATE` statement, on the right hand side of an assignment in the `SET` clause of an `UPDATE` statement.

- false

A user with `DELETE` privilege on the target table of a `DELETE` statement may reference any column of that target table in the `WHERE` clause. A user with `UPDATE` privilege on the target table of an `UPDATE` statement may reference any column of that target in the `WHERE` clause or on the right hand side of any assignment in the `SET` clause of the `UPDATE` statement.

## 2.384 SQLTUNE\_CATEGORY

`SQLTUNE_CATEGORY` specifies the category name for use by sessions to qualify the lookup of SQL profiles during SQL compilation.

| Property            | Description                                   |
|---------------------|-----------------------------------------------|
| Parameter type      | String                                        |
| Syntax              | <code>SQLTUNE_CATEGORY = category_name</code> |
| Default value       | DEFAULT                                       |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                   |
| Modifiable in a PDB | Yes                                           |
| Basic               | No                                            |

#### See Also:

*Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_SQLTUNE` package

## 2.385 STANDBY\_DB\_PRESERVE\_STATES

`STANDBY_DB_PRESERVE_STATES` controls whether user sessions, buffers, and other internal states of the instance are retained when a readable physical standby database is converted to

a primary database. This parameter is meaningful on a physical standby database that is open in real-time query mode.

| Property                   | Description                                                    |
|----------------------------|----------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                         |
| <b>Syntax</b>              | STANDBY_DB_PRESERVE_STATES = { NONE   SESSION   BUFFER   ALL } |
| <b>Default value</b>       | NONE                                                           |
| <b>Modifiable</b>          | No                                                             |
| <b>Modifiable in a PDB</b> | No                                                             |
| <b>Basic</b>               | No                                                             |
| <b>Oracle RAC</b>          | The same value must be used on all instances.                  |

### Values

- **NONE**  
Nothing is retained. All sessions are disconnected and all buffers are flushed. This is the default value.
- **SESSION**  
User sessions are retained. When the database is reopened as the primary, the retained sessions resume their operations as if nothing had happened. If the database (or an individual PDB) is not opened in the primary role, the sessions will be terminated.
- **BUFFER**  
All current buffers are retained. Media recovery buffers are converted to current buffers and retained, if possible. When the database is reopened as the primary, the retained buffers are available for use, which may enable queries to run faster during the first few minutes of operation. If the database (or an individual PDB) is not opened in the primary role, the buffers will be flushed.
- **ALL**  
This value is equivalent to setting both the `SESSION` and `BUFFER` values.

#### Note:

Sessions that have long running queries or are using database links will not be retained regardless of the setting of this parameter.

- *Oracle Data Guard Concepts and Administration* for more information about real-time query mode
- *Oracle Data Guard Concepts and Administration* for more information about preserving user sessions and buffers when a standby database is converted to a primary database

## 2.386 STANDBY\_FILE\_MANAGEMENT

STANDBY\_FILE\_MANAGEMENT enables or disables automatic standby file management.

| Property            | Description                                 |
|---------------------|---------------------------------------------|
| Parameter type      | String                                      |
| Syntax              | STANDBY_FILE_MANAGEMENT = { MANUAL   AUTO } |
| Default value       | MANUAL                                      |
| Modifiable          | ALTER SYSTEM                                |
| Modifiable in a PDB | No                                          |
| Basic               | No                                          |

When automatic standby file management is enabled, operating system file additions and deletions on the primary database are replicated on the standby database.

STANDBY\_FILE\_MANAGEMENT is only applicable to physical standby databases.

### Values

- MANUAL  
Disables automatic standby file management
- AUTO  
Enables automatic standby file management

Setting STANDBY\_FILE\_MANAGEMENT to AUTO causes Oracle to automatically create files on the standby database and, in some cases, overwrite existing files. Care must be taken when setting STANDBY\_FILE\_MANAGEMENT and DB\_FILE\_NAME\_CONVERT so that existing standby files will not be accidentally overwritten.

If the standby database is on the same system as the primary database, then ensure that the primary and standby systems do not point to the same files.

### See Also:

*Oracle Data Guard Concepts and Administration* for more information about setting this parameter

## 2.387 STANDBY\_PDB\_SOURCE\_FILE\_DBLINK

STANDBY\_PDB\_SOURCE\_FILE\_DBLINK specifies the name of a database link that will be used to try to copy the datafiles from a source PDB to which the database link points.

| Property       | Description                                    |
|----------------|------------------------------------------------|
| Parameter type | String                                         |
| Syntax         | STANDBY_PDB_SOURCE_FILE_DBLINK = database-link |
| Default value  | NULL                                           |

| Property                   | Description                                         |
|----------------------------|-----------------------------------------------------|
| <b>Modifiable</b>          | ALTER SYSTEM                                        |
| <b>Modifiable in a PDB</b> | No                                                  |
| <b>Basic</b>               | No                                                  |
| <b>Oracle RAC</b>          | Different values can be set on different instances. |

In Oracle Database releases prior to Oracle Database 18c, if a PDB was created by cloning a PDB from the same CDB (a local clone), on a standby the datafiles were automatically copied from the source PDB. However, when the PDB was created as a remote clone, the user was responsible for copying datafiles to the Oracle Managed Files (OMF) location on the standby.

To address that deficiency, the `STANDBY_PDB_SOURCE_FILE_DBLINK` parameter specifies the name of a database link that will be used to try to copy the datafiles from a source PDB to which the database link points. The file copy is done only if the database link points to the source PDB and the source PDB is open in read only mode. Otherwise, the user is still responsible for copying datafiles to the OMF location on the standby.

This parameter can also be used to try to copy files in cases where the source PDB's files are not present on the standby. For example, the source PDB could have been created with `standbys=NONE`. In this case, the `STANDBY_PDB_SOURCE_FILE_DBLINK` parameter can enable the standby to copy files from the primary if there is a database link set up to the primary.

**See Also:**

"[STANDBY\\_PDB\\_SOURCE\\_FILE\\_DIRECTORY](#)"

## 2.388 STANDBY\_PDB\_SOURCE\_FILE\_DIRECTORY

`STANDBY_PDB_SOURCE_FILE_DIRECTORY` specifies a directory location on the standby where source datafiles for instantiating the standby PDB may be found.

| Property                   | Description                                                          |
|----------------------------|----------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                               |
| <b>Syntax</b>              | <code>STANDBY_PDB_SOURCE_FILE_DIRECTORY = datafiles-directory</code> |
| <b>Default value</b>       | NULL                                                                 |
| <b>Modifiable</b>          | ALTER SYSTEM                                                         |
| <b>Modifiable in a PDB</b> | No                                                                   |
| <b>Basic</b>               | No                                                                   |
| <b>Oracle RAC</b>          | Different values can be set on different instances.                  |

In Oracle Database releases prior to Oracle Database 18c, if a PDB was plugged into a CDB, on a standby, the datafiles were expected to be in PDB's Oracle Managed Files (OMF) directory location. If they were not found there, the user had to copy the datafiles to the OMF location and then restart redo apply on the standby.

To address that deficiency, the `STANDBY_PDB_SOURCE_FILE_DIRECTORY` specifies a directory location on the standby where source datafiles for instantiating the PDB may be found. If the

datafiles are not found there, an attempt will be made to locate them in the OMF location on the standby.

This parameter can also be used to try to copy files in cases where the source PDB's files are not present on the standby. For example, the source PDB could have been created with `standbys=NONE`. In this case, the `STANDBY_PDB_SOURCE_FILE_DIRECTORY` parameter can enable the standby to copy files from a location if they are made available.

**See Also:**

["STANDBY\\_PDB\\_SOURCE\\_FILE\\_DBLINK"](#)

## 2.389 STAR\_TRANSFORMATION\_ENABLED

`STAR_TRANSFORMATION_ENABLED` determines whether a cost-based query transformation will be applied to star queries.

| Property            | Description                                                                |
|---------------------|----------------------------------------------------------------------------|
| Parameter type      | String                                                                     |
| Syntax              | <code>STAR_TRANSFORMATION_ENABLED = { FALSE   TRUE   TEMP_DISABLE }</code> |
| Default value       | FALSE                                                                      |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                                                |
| Modifiable in a PDB | Yes                                                                        |
| Basic               | Yes                                                                        |

### Values

- FALSE  
The transformation will not be applied.
- TRUE  
The optimizer will consider performing a cost-based query transformation on the star query.
- TEMP\_DISABLE  
The optimizer will consider performing a cost-based query transformation on the star query but will not use temporary tables in the star transformation.

**See Also:**

- *Oracle Database SQL Tuning Guide* for information on enabling star queries

## 2.390 STATISTICS\_LEVEL

`STATISTICS_LEVEL` specifies the level of collection for database and operating system statistics. The Oracle Database collects these statistics for a variety of purposes, including making self-management decisions.

| Property                   | Description                                               |
|----------------------------|-----------------------------------------------------------|
| <b>Parameter type</b>      | String                                                    |
| <b>Syntax</b>              | <code>STATISTICS_LEVEL = { ALL   TYPICAL   BASIC }</code> |
| <b>Default value</b>       | <code>TYPICAL</code>                                      |
| <b>Modifiable</b>          | <code>ALTER SESSION, ALTER SYSTEM</code>                  |
| <b>Modifiable in a PDB</b> | Yes                                                       |
| <b>Basic</b>               | No                                                        |

The default setting of `TYPICAL` ensures collection of all major statistics required for database self-management functionality and provides best overall performance. The default value should be adequate for most environments.

When the `STATISTICS_LEVEL` parameter is set to `ALL`, additional statistics are added to the set of statistics collected with the `TYPICAL` setting. The additional statistics are timed operating system statistics and plan execution statistics.

Setting the `STATISTICS_LEVEL` parameter to `BASIC` disables the collection of many of the important statistics required by Oracle Database features and functionality, including:

- All server-generated alerts
- Automatic Database Diagnostic Monitor (ADDM)
- Automatic optimizer statistics collection
- Automatic SGA Memory Management
- Automatic Workload Repository (AWR) Snapshots
- Buffer cache advisory
- Database time distribution statistics (`V$SESS_TIME_MODEL` and `V$SYS_TIME_MODEL`)
- End to End Application Tracing (`V$CLIENT_STATS`)
- Monitoring of statistics
- MTTR advisory
- Object Activity Tracking System (OATS)
- Object level statistics
- PGA Target advisory
- Segment level statistics
- Service level statistics
- Shared pool sizing advisory
- Timed statistics

**Note:**

Oracle strongly recommends that you do not disable these important features and functionality.

When the `STATISTICS_LEVEL` parameter is modified by `ALTER SYSTEM`, all advisories or statistics are dynamically turned on or off, depending on the new value of `STATISTICS_LEVEL`. When modified by `ALTER SESSION`, the following advisories or statistics are turned on or off in the local session only. Their systemwide state is not changed:

- Timed statistics
- Timed operating system statistics
- Plan execution statistics

The `V$STATISTICS_LEVEL` view displays information about the status of the statistics or advisories controlled by the `STATISTICS_LEVEL` parameter. See "[V\\$STATISTICS\\_LEVEL](#)".

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this parameter

## 2.391 STREAMS\_POOL\_SIZE

The `STREAMS_POOL_SIZE` value helps determine the size of the Streams pool.

| Property                   | Description                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Big integer                                                                                                             |
| <b>Syntax</b>              | <code>STREAMS_POOL_SIZE = integer [K   M   G]</code>                                                                    |
| <b>Default value</b>       | 0                                                                                                                       |
| <b>Modifiable</b>          | <code>ALTER SYSTEM</code>                                                                                               |
| <b>Modifiable in a PDB</b> | No                                                                                                                      |
| <b>Range of values</b>     | Minimum: 0 (values greater than zero are rounded up to the nearest granule size)<br>Maximum: operating system-dependent |
| <b>Basic</b>               | No                                                                                                                      |

Oracle's Automatic Shared Memory Management feature manages the size of the Streams pool when the `SGA_TARGET` initialization parameter is set to a nonzero value. If the `STREAMS_POOL_SIZE` initialization parameter also is set to a nonzero value, then Automatic Shared Memory Management uses this value as a minimum for the Streams pool.

If `SGA_TARGET` is set to a nonzero value and `STREAMS_POOL_SIZE` is not specified or is set to a null value, Automatic Shared Memory Management uses 0 (zero) bytes as a minimum for the Streams pool.

If the `STREAMS_POOL_SIZE` initialization parameter is set to a nonzero value, and the `SGA_TARGET` parameter is set to 0 (zero), then the Streams pool size is the value specified by the `STREAMS_POOL_SIZE` parameter, in bytes.

If both the `STREAMS_POOL_SIZE` and the `SGA_TARGET` initialization parameters are set to 0 (zero), then, by default, on the first request for Streams pool memory in a database, an amount of memory equal to 10% of the shared pool is transferred from the buffer cache to the Streams pool. Products and features that use the Streams pool include Oracle GoldenGate, XStream, Oracle Advanced Queuing, and Oracle Data Pump.

The Streams pool is a shared resource, and the amount of memory a process can use from the Streams pool is determined by the application. The capture or apply parameter `MAX_SGA_SIZE` can be controlled for Oracle GoldenGate or XStream. For Oracle Advanced Queuing, use the procedures in the `dbms_aqadm` package to control the amount of Streams Pool needed.

## 2.392 SYSDATE\_AT\_DBTIMEZONE

`SYSDATE_AT_DBTIMEZONE` enables special handling for the date and time value returned in calls to `SYSDATE` and `SYSTIMESTAMP`.

Depending on the value of `SYSDATE_AT_DBTIMEZONE`, you see either the date and time based on the default Autonomous Database time zone, Coordinated Universal Time (UTC), or based on the time zone that you set in your database.

 **Note:**

This parameter is valid only for Oracle Autonomous Database Serverless. On other types of Oracle databases, the value of this parameter is ignored.

 **See Also:**

*Using Oracle Autonomous Database Serverless* for more information about this parameter

## 2.393 TABLESPACE\_ENCRYPTION

TABLESPACE\_ENCRYPTION specifies the tablespace encryption policy for a database.

| Property                   | Description                                                            |
|----------------------------|------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                 |
| <b>Syntax</b>              | TABLESPACE_ENCRYPTION = { AUTO_ENABLE   MANUAL_ENABLE   DECRYPT_ONLY } |
| <b>Default value</b>       | Cloud databases: AUTO_ENABLE<br>On-premises databases: MANUAL_ENABLE   |
| <b>Modifiable</b>          | No                                                                     |
| <b>Modifiable in a PDB</b> | No                                                                     |
| <b>Basic</b>               | No                                                                     |
| <b>Oracle RAC</b>          | The same value should be specified for all instances.                  |

The TABLESPACE\_ENCRYPTION parameter is an alternative to the deprecated ENCRYPT\_NEW\_TABLESPACES parameter. Similar to ENCRYPT\_NEW\_TABLESPACES, this parameter allows you to specify whether to encrypt newly created user tablespaces. However, the TABLESPACE\_ENCRYPTION parameter offers an additional benefit in Data Guard environments. In previous releases, tablespaces in Data Guard environments were required to use the same encryption policy on the primary and standby databases. For example, if all tablespaces were encrypted on the primary database, then all tablespaces were required to be encrypted on the standby database. The TABLESPACE\_ENCRYPTION parameter eliminates this requirement and allows you to use different tablespace encryption policies on primary and standby databases. See *Oracle Database Transparent Data Encryption Guide* for more information.

If the behavior specified by the ENCRYPT\_NEW\_TABLESPACES setting conflicts with the behavior specified by the TABLESPACE\_ENCRYPTION setting, then the TABLESPACE\_ENCRYPTION behavior takes precedence.

### Values:

- AUTO\_ENABLE

Use this setting if you would like to encrypt all tablespaces in the database.

All newly created tablespaces will be encrypted. In the CREATE TABLESPACE statement, if you specify the DECRYPT clause, it will be ignored and the tablespace will be encrypted. If you specify the ENCRYPTION USING *algorithm* ENCRYPT clause, the specified algorithm will be used to encrypt the tablespace. If you specify the ENCRYPTION ENCRYPT clause and do not specify an algorithm, the tablespace will be encrypted with the algorithm specified by the TABLESPACE\_ENCRYPTION\_DEFAULT\_ALGORITHM parameter.

If an existing tablespace is unencrypted, the database writes a warning to the alert log. See *Oracle Database Transparent Data Encryption Guide* for information about encrypting existing tablespaces.

If you attempt to decrypt an existing encrypted tablespace, an error will occur.

This is the default setting for Cloud databases. Moreover, because all tablespaces must be encrypted in the Cloud, setting this parameter to MANUAL\_ENABLE or DECRYPT\_ONLY for a Cloud database will be ignored and the Cloud database will behave as if the setting is AUTO\_ENABLE.

- MANUAL\_ENABLE

Use this setting if you would like to manually control which tablespaces are encrypted.

To encrypt a tablespace, specify the `ENCRYPTION ... ENCRYPT` clause in the `CREATE TABLESPACE` statement. If you specify the `ENCRYPTION USING algorithm ENCRYPT` clause, the specified algorithm will be used to encrypt the tablespace. If you specify the `ENCRYPTION ENCRYPT` clause and do not specify an algorithm, the tablespace will be encrypted with the algorithm specified by the `TABLESPACE_ENCRYPTION_DEFAULT_ALGORITHM` parameter.

This is the default setting for on-premises databases. This setting is ignored for Cloud databases.

- DECRYPT\_ONLY

Use this setting if you do not want any encrypted tablespaces in the database.

All newly created tablespaces must be unencrypted. If you specify the `ENCRYPT` clause in the `CREATE TABLESPACE` statement, an error will occur.

If an existing tablespace is encrypted, the database writes a warning to the alert log. See *Oracle Database Transparent Data Encryption Guide* for information about decrypting existing tablespaces.

If you attempt to encrypt an existing unencrypted tablespace, an error will occur.

This setting is valid only for on-premises databases. This setting is ignored for Cloud databases.

## 2.394 TABLESPACE\_ENCRYPTION\_DEFAULT\_ALGORITHM

`TABLESPACE_ENCRYPTION_DEFAULT_ALGORITHM` specifies the default algorithm the database uses when encrypting a tablespace.

| Property                   | Description                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                                                                                                                                                                                  |
| <b>Syntax</b>              | <code>TABLESPACE_ENCRYPTION_DEFAULT_ALGORITHM = { AES128   AES192   AES256   ARIA128   ARIA192   ARIA256   3DES168 }</code><br><b>Note:</b> 3DES168 must be enclosed in single quotation marks when specified in the <code>ALTER SYSTEM</code> command. |
| <b>Default value</b>       | AES256                                                                                                                                                                                                                                                  |
| <b>Modifiable</b>          | ALTER SYSTEM                                                                                                                                                                                                                                            |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                                                                     |
| <b>Basic</b>               | No                                                                                                                                                                                                                                                      |
| <b>Oracle RAC</b>          | The same value should be specified for all instances.                                                                                                                                                                                                   |

The value of this initialization parameter determines the algorithm the database uses if an encryption algorithm is not specified when creating an encrypted tablespace or when encrypting an existing tablespace. For example, the value of this parameter takes effect when:

- You create a tablespace with the `CREATE TABLESPACE` statement and you specify the `ENCRYPTION ... ENCRYPT` clause, but you do not specify the `USING` keyword and an algorithm.
- You create a tablespace with the `CREATE TABLESPACE` statement and you do not specify the `ENCRYPTION ... ENCRYPT` clause. However, the value of the `ENCRYPT_NEW_TABLESPACES` initialization parameter instructs the database to encrypt the tablespace.
- You encrypt an existing tablespace with the `ALTER TABLESPACE` statement, either by specifying the `ENCRYPTION OFFLINE ENCRYPT` clause or the `ENCRYPTION ONLINE ... ENCRYPT` clause, and you do not specify the `USING` keyword and an algorithm.

 **Note:**

GOST 28147-89 has been deprecated by the Russian government, and SEED has been deprecated by the South Korean government. If you need South Korean government-approved TDE cryptography, then use ARIA instead. If you are using GOST 28147-89, then you must decrypt and encrypt with another supported TDE algorithm. The decryption algorithms for GOST 28147-89 and SEED are included in Oracle Database 23ai, but are deprecated, and the GOST encryption algorithm is desupported with Oracle Database 23ai. If you are using GOST or SEED for TDE encryption, then Oracle recommends that you online re-key to another algorithm before upgrading to Oracle Database 23ai. However, with the exception of the HP Itanium platform, the GOST and SEED decryption libraries are available with Oracle Database 23ai, so you can also decrypt after upgrading.

 **See Also:**

- *Oracle Database SQL Language Reference* for more information about the `ALTER TABLESPACE` statement

## 2.395 TAPE\_ASYNC\_IO

`TAPE_ASYNC_IO` controls whether I/O to sequential devices (for example, backup or restore of Oracle data to or from tape) is asynchronous—that is, whether parallel server processes can overlap I/O requests with CPU processing during table scans.

| Property            | Description  |
|---------------------|--------------|
| Parameter type      | Boolean      |
| Default value       | true         |
| Modifiable          | No           |
| Modifiable in a PDB | No           |
| Range of values     | true   false |

| Property | Description |
|----------|-------------|
| Basic    | No          |

If your platform supports asynchronous I/O to sequential devices, Oracle recommends that you leave this parameter set to its default. However, if the asynchronous I/O implementation is not stable, you can set `TAPE_ASYNC_IO` to `false` to disable asynchronous I/O. If your platform does not support asynchronous I/O to sequential devices, this parameter has no effect.

**See Also:**

*Oracle Database VLDB and Partitioning Guide* for more information about this parameter

## 2.396 TDE\_CONFIGURATION

Use `TDE_CONFIGURATION` to set the type of keystore that is used for Transparent Data Encryption (TDE) by the root container; united PDBs inherit the value from the root container, isolated PDBs can be set individually.

Before Oracle Database 18c, each PDB stored its separate encryption keys in the CDB's keystore (united mode). Starting with Oracle Database 18c Cloud environments, a PDB can optionally store its encryption keys in a separate keystore (isolated mode), thus allowing protection by a separate keystore password. Starting with Oracle Database 19c, version 19.14, isolated mode is available for all Oracle database deployments, including on-premises databases, legacy deployments, and engineered systems.

The `WALLET_ROOT` initialization parameter must be set in order for `TDE_CONFIGURATION` to take effect.

| Property       | Description                                                                                    |
|----------------|------------------------------------------------------------------------------------------------|
| Parameter type | String                                                                                         |
| Syntax         | <code>TDE_CONFIGURATION = "{ KEYSTORE_CONFIGURATION = value [; CONTAINER = pdb-name] }"</code> |

| Property                   | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <b>value ::=</b><br><pre>{ FILE   OKV   HSM   FILE OKV   FILE HSM   OKV FILE   HSM FILE }</pre> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>The KEYSTORE_CONFIGURATION value is case-insensitive. For example, you can specify FILE or file.</li> <li>FILE OKV, FILE HSM, OKV FILE, and HSM FILE are values. The vertical bars they contain are not separators in the syntax shown above.</li> </ul> |
| <b>Default value</b>       | None                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Modifiable</b>          | ALTER SYSTEM <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Basic</b>               | No                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Oracle RAC</b>          | The same value must be specified on all instances using the ALTER SYSTEM SET TDE_CONFIGURATION="KEYSTORE_CONFIGURATION=value" SCOPE=BOTH SID='*'; statement.                                                                                                                                                                                                                                                         |

<sup>1</sup> In some cases, when this parameter is set using ALTER SYSTEM SCOPE=SPFILE, the SHOW PARAMETER TDE\_CONFIGURATION statement does not show the correct value. However, the value set for TDE\_CONFIGURATION can be derived from information shown in the V\$ENCRYPTION\_WALLET view.

The following attributes can be specified:

- KEYSTORE\_CONFIGURATION attribute. This attribute is required. The value specified with this attribute configures the keystore type for the specified PDB. The following values can be specified for this attribute:
  - FILE: This value configures a wallet keystore.
  - OKV: This value configures the database to use Oracle Key Vault (OKV) for TDE key management.  
  
This value is also used to disable an auto-login OKV configuration and cause any existing cwallet.sso files, containing the credentials to the OKV server as the OKV\_PASSWORD client secret, to be ignored.
  - HSM: This value configures a hardware security module (HSM).  
  
Oracle does not support the use of HSMs for TDE key management. For more information, see My Oracle Support note 2310066.1 "Oracle TDE Support With 3rd Party HSM Vendors" at the following URL: <https://support.oracle.com/rs?type=doc&id=2310066.1>
  - FILE|OKV: This value configures a reverse migration from OKV to a wallet keystore.
  - FILE|HSM: This value configures a reverse migration from a HSM to a wallet keystore.

- OKV|FILE: This value configures a migration from a wallet to OKV.

This value is also used in an auto-login OKV configuration, because in this configuration a `cwallet.sso` file, containing the `OKV_PASSWORD` client secret, must be used by the Oracle server to obtain the credentials to log in to the OKV server.

- HSM|FILE: This value configures a migration from a wallet to a HSM.

Oracle does not support the use of HSMs for TDE key management. For more information, see My Oracle Support note 2310066.1 "Oracle TDE Support With 3rd Party HSM Vendors" at the following URL: <https://support.oracle.com/rs?type=doc&id=2310066.1>

Some of the `KEystore_CONFIGURATION` attribute values consist of a single word, for example, the `FILE`, `OKV`, and `HSM` values. The other `KEystore_CONFIGURATION` attribute values consist of two words separated by the "|" character that is a required part of the value's syntax, for example, the `FILE|OKV`, `FILE|HSM`, `OKV|FILE`, and `HSM|FILE` values.

- **CONTAINER attribute:** This optional attribute can be used only when setting the parameter in the `CDB$ROOT` of a CDB. The `CONTAINER` attribute can be specified only when the `CDB$ROOT` is in `MOUNTED` state. With this attribute, you must specify the name of the PDB for which you are setting the parameter. When you specify the `CONTAINER` attribute, you must use a semicolon ";" as the separation character between the `KEystore_CONFIGURATION` and `CONTAINER` attributes.

## Examples

The following statement configures a wallet keystore for the open PDB from which the statement is issued:

```
ALTER SYSTEM SET TDE_CONFIGURATION="KEystore_CONFIGURATION=FILE" SCOPE=BOTH SID='*';
```

The following statement configures an OKV keystore for the PDB in `MOUNTED` state from which the statement is issued:

```
ALTER SYSTEM SET TDE_CONFIGURATION="KEystore_CONFIGURATION=OKV" SCOPE=SPFILE SID='*';
```

The following statement configures an isolated standby PDB for an auto-open Oracle Key Vault setup; standby PDBs are `MOUNTED`, so the command must be executed in the standby root CDB:

```
ALTER SYSTEM SET TDE_CONFIGURATION="KEystore_CONFIGURATION=OKV|FILE;
CONTAINER=FINANCIALS" SCOPE=both SID='*';
```

## 2.397 TDE\_KEY\_CACHE

Use `TDE_KEY_CACHE` to enable or disable sharing of Transparent Data Encryption (TDE) master encryption keys across Oracle processes.

### Note:

This parameter is available only for databases in Oracle Cloud Infrastructure (OCI) that use the OCI Key Management Service (KMS) for TDE key management.

| Property            | Description                                   |
|---------------------|-----------------------------------------------|
| Parameter type      | Boolean                                       |
| Default value       | false                                         |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                   |
| Modifiable in a PDB | Yes                                           |
| Range of values     | true   false                                  |
| Basic               | No                                            |
| Oracle RAC          | The same value must be used on all instances. |

### Values:

- `true`  
Enables sharing of TDE master encryption keys across Oracle processes
- `false`  
Disables sharing of TDE master encryption keys across Oracle processes

### See Also:

## 2.398 TEMP\_UNDO\_ENABLED

`TEMP_UNDO_ENABLED` determines whether transactions within a particular session can have a temporary undo log.

| Property       | Description |
|----------------|-------------|
| Parameter type | Boolean     |
| Default value  | false       |

| Property                   | Description                                                                      |
|----------------------------|----------------------------------------------------------------------------------|
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                                      |
| <b>Modifiable in a PDB</b> | Yes                                                                              |
| <b>Range of values</b>     | true   false                                                                     |
| <b>Basic</b>               | No                                                                               |
| <b>Oracle RAC</b>          | Each session of each instance can have its own value or not set any value at all |

The default choice for database transactions has been to have a single undo log per transaction. This parameter, at the session level / system level scope, lets a transaction split its undo log into temporary undo log (for changes on temporary objects) and permanent undo log (for changes on persistent objects).

By splitting the undo stream of a transaction into two streams (temporary and permanent), a database can provide separate storage and retention model for these. This results in overall reduction in the size of undo log and redo log in the database

If database applications make use of temporary objects (using global temporary tables or temporary table transformations), it is advisable to set this parameter's value to `true`.

When `TEMP_UNDO_ENABLED` is set to `true` and the `COMPATIBLE` initialization parameter is set to `12.0.0`, this feature is enabled. The temporary undo feature is enabled for the session in which it is set. Setting it across the system will affect all existing and upcoming sessions. If the value is set in the `init.ora` file, all upcoming sessions will inherit this value unless overwritten by an explicit `ALTER SESSION` or `ALTER SYSTEM` statement. All undo for operations on temporary objects is deemed temporary.

If `TEMP_UNDO_ENABLED` is not set to `true`, existing applications that make use of temporary objects run as is without any change.

Once the value of the parameter is set, it cannot be changed for the lifetime of the session. If the session has temporary objects using temporary undo, the parameter cannot be disabled for the session. Similarly, if the session already has temporary objects using regular undo, setting this parameter will have no effect.

This parameter is only applicable for the primary database. For a standby database, this parameter is ignored because temporary undo is enabled by default on the standby database.

## 2.399 THREAD

THREAD has been superseded by the `INSTANCE_NAME` and `INSTANCE_NUMBER` parameters, and will be made obsolete in a future release of the Oracle Database.

| Property              | Description |
|-----------------------|-------------|
| <b>Parameter type</b> | Integer     |

| Property            | Description                                                  |
|---------------------|--------------------------------------------------------------|
| Default value       | 0                                                            |
| Modifiable          | No                                                           |
| Modifiable in a PDB | No                                                           |
| Range of values     | 0 to the maximum number of enabled threads                   |
| Basic               | No                                                           |
| Oracle RAC          | If specified, multiple instances must have different values. |

**See Also:**

"INSTANCE\_NAME" and "INSTANCE\_NUMBER"

## 2.400 THREADED\_EXECUTION

THREADED\_EXECUTION specifies whether to enable the multithreaded Oracle model.

| Property            | Description                                         |
|---------------------|-----------------------------------------------------|
| Parameter type      | Boolean                                             |
| Default value       | On UNIX and Linux: false<br>On Windows: true        |
| Modifiable          | No                                                  |
| Modifiable in a PDB | No                                                  |
| Range of values     | true   false                                        |
| Basic               | No                                                  |
| Oracle RAC          | If specified, all instances must use the same value |

### THREADED\_EXECUTION on UNIX and Linux

Oracle Database 12c introduced the `THREADED_EXECUTION` initialization parameter for databases running on UNIX and Linux systems. On such databases, the default value for `THREADED_EXECUTION` is `false`. Setting this parameter to `true` enables the multithreaded Oracle model, which allows Oracle processes on UNIX and Linux to run as operating system threads in separate address spaces.

By default, some background processes on UNIX and Linux always use threaded execution; the remaining Oracle processes run as operating system processes. Thus, an "Oracle process" is not always equivalent to an "operating system process."

 **Note:**

When `THREADED_EXECUTION` is set to `true` on databases running on UNIX and Linux systems, which enables the multithreaded Oracle model, operating system authentication is not supported. Attempts to connect to the database using operating system authentication (for example, `CONNECT / AS SYSDBA` or `CONNECT /`) when this initialization parameter is set to `true` receive an `ORA-01031 "insufficient privileges"` error.

The solution to this error is to always use the password when connecting to the database.

Also, when this initialization parameter is set to `true` on databases running on UNIX and Linux systems, the `DEDICATED_THROUGH_BROKER_listener-name=ON` parameter should be added to the `listener.ora` file, where `listener-name` is the name of the Oracle Net listener and the `LOCAL_LISTENER` initialization parameter should be set to a TNS name entry corresponding to your instance service. This enables the server to spawn threads when connections to the database are requested through the listener.

### THREADED\_EXECUTION on Windows

Starting with Oracle Database 21c, the `THREADED_EXECUTION` initialization parameter is supported for databases running on Microsoft Windows. On such databases, this parameter must remain set to its default value of `true`; setting this parameter to `false` on databases running on Windows is not supported. The introduction of this parameter does not change the threading model for Oracle database on Windows. As in previous releases, an Oracle Database server instance on Windows is a service with a single multi-threaded operating system process. However, starting with Oracle Database 21c, you will observe changes to the `V$PROCESS` view, the dedicated connection broker, and the naming of trace files. For details about these changes, refer to *Oracle Database Administrator's Reference for Microsoft Windows*.

 **Note:**

Unlike on UNIX and Linux systems, when `THREADED_EXECUTION` is set to `true` on Windows, operating system authentication is supported.

## 2.401 TIME\_AT\_DBTIMEZONE

`TIME_AT_DBTIMEZONE` specifies whether time-dependent database operations use the time zone of the database host system or the time zone of the PDB.

Some examples of time-dependent database operations are running the SQL functions `SYSDATE` and `SYSTIMESTAMP`, querying table columns of type `DATE` or `TIMESTAMP`, using Oracle Job scheduler, performing materialized view refresh, and using Oracle Flashback Technology.

| Property                   | Description                                                     |
|----------------------------|-----------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                          |
| <b>Syntax</b>              | <code>TIME_AT_DBTIMEZONE = { OFF   USER_SQL   DATABASE }</code> |
| <b>Default value</b>       | OFF                                                             |
| <b>Modifiable</b>          | No                                                              |
| <b>Modifiable in a PDB</b> | Yes                                                             |
| <b>Basic</b>               | No                                                              |
| <b>Oracle RAC</b>          | Multiple instances must use the same value.                     |

### Values:

- **OFF** - For all time-dependent operations, the database uses the time zone of the database host system that was in effect when the database was started. This is the behavior in releases prior to Oracle Database 23ai.
- **USER\_SQL** - The SQL functions `SYSDATE` and `SYSTIMESTAMP` return the date and time based on the `DBTIMEZONE` setting for the PDB. For all other time-dependent operations, the database uses the time zone of the database host system that was in effect when the database was started.
- **DATABASE** - For all time-dependent operations, the database uses the time zone specified by the `DBTIMEZONE` setting for the PDB.

### Note:

This parameter is available starting with Oracle Database 23ai.

### See Also:

- *Oracle Database SQL Language Reference* for information about the `SYSDATE` function
- *Oracle Database SQL Language Reference* for information about the `SYSTIMESTAMP` function

## 2.402 TIMED\_OS\_STATISTICS

**TIMED\_OS\_STATISTICS** specifies (in seconds) the interval at which Oracle collects operating system statistics when a request is made from the client to the server or when a request completes.

| Property                   | Description                                                                                                                               |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Integer                                                                                                                                   |
| <b>Default value</b>       | If <b>STATISTICS_LEVEL</b> is set to <b>ALL</b> , then 60<br>If <b>STATISTICS_LEVEL</b> is set to <b>BASIC</b> or <b>TYPICAL</b> , then 0 |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                                                                                               |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                       |
| <b>Range of values</b>     | Unlimited                                                                                                                                 |
| <b>Basic</b>               | No                                                                                                                                        |

On dedicated servers, Oracle collects operating system statistics at user logon and after each subsequent client invocation through the OCI into the Oracle server as a remote procedure call message.

On shared servers, Oracle collects statistics when client calls to Oracle are processed.

A value of zero specifies that operating system statistics are not gathered. To collect statistics, set a value meaningful for your application and site needs.

### Note:

Gathering operating system statistics is very expensive. Oracle recommends that you set this parameter in an **ALTER SYSTEM** statement rather than in the initialization parameter file, and that you reset the value to zero as soon as the needed statistics have been gathered.

### See Also:

*Oracle Database Performance Tuning Guide* for more information about this parameter

## 2.403 TIMED\_STATISTICS

**TIMED\_STATISTICS** specifies whether statistics related to time are collected.

| Property              | Description                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b> | Boolean                                                                                                                                                       |
| <b>Default value</b>  | If <b>STATISTICS_LEVEL</b> is set to <b>TYPICAL</b> or <b>ALL</b> , then <b>true</b><br>If <b>STATISTICS_LEVEL</b> is set to <b>BASIC</b> , then <b>false</b> |

| Property                   | Description                 |
|----------------------------|-----------------------------|
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM |
| <b>Modifiable in a PDB</b> | Yes                         |
| <b>Range of values</b>     | true   false                |
| <b>Basic</b>               | No                          |

### Values

- `true`  
The statistics are collected and stored in trace files or displayed in the `V$SESSTATS` and `V$SYSSTATS` dynamic performance views.
- `false`  
The value of all time-related statistics is set to zero. This setting lets Oracle avoid the overhead of requesting the time from the operating system.

Starting with release 11.1.0.7.0, the value of the `TIMED_STATISTICS` parameter cannot be set to `false` if the value of `STATISTICS_LEVEL` is set to `TYPICAL` or `ALL`.

On some systems with very fast timer access, Oracle might enable timing even if this parameter is set to `false`. On these systems, setting the parameter to `true` can sometimes produce more accurate statistics for long-running operations.

### See Also:

- *Oracle Database SQL Tuning Guide* for more information on setting this parameter
- [Statistics Descriptions](#) indicates which statistics depend on the setting of this parameter.

## 2.404 TIMEZONE\_VERSION\_UPGRADE\_ONLINE

`TIMEZONE_VERSION_UPGRADE_ONLINE` enables you to keep the database running in normal mode while upgrading time zone data using the `DBMS_DST` package.

| Property                   | Description                                  |
|----------------------------|----------------------------------------------|
| <b>Parameter type</b>      | Boolean                                      |
| <b>Default value</b>       | false                                        |
| <b>Modifiable</b>          | ALTER SYSTEM                                 |
| <b>Modifiable in a PDB</b> | Yes                                          |
| <b>Range of values</b>     | true   false                                 |
| <b>Basic</b>               | No                                           |
| <b>Oracle RAC</b>          | Multiple instances must have the same value. |

In releases prior to Oracle Database 21c, you were required to put the database in `UPGRADE` mode in order to initiate a time zone data upgrade using the `DBMS_DST` package. Starting with Oracle Database 21c, you can perform such an upgrade while the database is in normal mode by setting the value of `TIMEZONE_VERSION_UPGRADE_ONLINE` to `true`.

**Note:**

Setting the value of this parameter is only one step in a series of steps for upgrading your time zone data. Refer to *Oracle Database Globalization Support Guide* for the complete set of steps before you set this parameter value.

## 2.405 TRACE\_ENABLED

`TRACE_ENABLED` controls tracing of the execution history, or code path, of Oracle. Oracle Support Services uses this information for debugging.

| Property                   | Description                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | Boolean                                                                                                 |
| <b>Default value</b>       | <code>true</code>                                                                                       |
| <b>Modifiable</b>          | <code>ALTER SYSTEM</code>                                                                               |
| <b>Modifiable in a PDB</b> | No                                                                                                      |
| <b>Range of values</b>     | <code>true</code>   <code>false</code>                                                                  |
| <b>Basic</b>               | No                                                                                                      |
| <b>Oracle RAC</b>          | The default value is <code>TRUE</code> . Oracle recommends that multiple instances have the same value. |

When `TRACE_ENABLED` is set to `true`, Oracle records information in specific files when errors occur.

Oracle records this information for all instances, even if only one instance terminates. This allows Oracle to retain diagnostics for an entire cluster.

Although the overhead incurred from this processing is not excessive, you can improve performance by setting `TRACE_ENABLED` to `false`. You might do this, for example, to meet high-end benchmark requirements. However, if you leave this parameter set to `false`, you may lose valuable diagnostic information. Therefore, always set `TRACE_ENABLED` to `true` to trace system problems and to reduce diagnostic efforts when unexplained instance failures occur.

## 2.406 TRACEFILE\_IDENTIFIER

`TRACEFILE_IDENTIFIER` specifies a custom identifier that becomes part of the Oracle Trace file name. Such a custom identifier is used to identify a trace file simply from its name and without having to open it or view its contents.

| Property              | Description                                   |
|-----------------------|-----------------------------------------------|
| <b>Parameter type</b> | String                                        |
| <b>Syntax</b>         | <code>TRACEFILE_IDENTIFIER = "traceid"</code> |

| Property                   | Description                                                                   |
|----------------------------|-------------------------------------------------------------------------------|
| <b>Default value</b>       | There is no default value.                                                    |
| <b>Modifiable</b>          | ALTER SESSION                                                                 |
| <b>Modifiable in a PDB</b> | No                                                                            |
| <b>Range of values</b>     | Any characters that can occur as part of a file name on the customer platform |
| <b>Basic</b>               | No                                                                            |

Each time this parameter is dynamically modified, the next trace dump will be written to a trace file which has the new parameter value embedded in its name. Trace file continuity information is automatically added to both the old and new trace files to indicate that these trace files belong to the same process.

This parameter can only be used to change the name of the foreground process' trace file; the background processes continue to have their trace files named in the regular format. For foreground processes, the `TRACEID` column of the `V$PROCESS` view contains the current value of the `TRACEFILE_IDENTIFIER` parameter. When this parameter value is set, the trace file name has the following format:

```
sid_ora_pid_traceid.trc
```

In this example, *sid* is the Oracle instance ID, *pid* is the process ID, and *traceid* is the value of the `TRACEFILE_IDENTIFIER` parameter.

#### See Also:

- *Oracle Database SQL Tuning Guide* for more information about this parameter
- This parameter is not supported on all operating systems. See your operating system-specific Oracle documentation for more information.

## 2.407 TRANSACTION\_RECOVERY

`TRANSACTION_RECOVERY` specifies whether transaction recovery is enabled or disabled for a PDB.

Transaction recovery refers to the series of steps that the database performs in the event of a crash (either an instance crash or a transaction crash) to roll back uncommitted transactions.

| Property                   | Description                                                |
|----------------------------|------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                     |
| <b>Syntax</b>              | <code>TRANSACTION_RECOVERY = { ENABLED   DISABLED }</code> |
| <b>Default value</b>       | ENABLED                                                    |
| <b>Modifiable</b>          | ALTER SYSTEM                                               |
| <b>Modifiable in a PDB</b> | Yes                                                        |
| <b>Basic</b>               | No                                                         |
| <b>Oracle RAC</b>          | Multiple instances must use the same value.                |

**Values:**

- `ENABLED` - Transaction recovery is enabled for a PDB.
- `DISABLED` - Transaction recovery is disabled for a PDB.

During normal operation, the value of this parameter is set to `ENABLED` by the database and this setting should not be modified by a DBA. However, there are two circumstances under which it is permissible for a DBA to modify the value of this parameter:

- A quarantined transaction is a transaction that is isolated and for which transaction recovery will not be attempted while the quarantine on it remains. It requires intervention by the DBA to first resolve the issue that caused the transaction to be quarantined, and then to drop the transaction quarantine so that transaction recovery is attempted again. If transaction recovery becomes disabled on a PDB due to an excessive number of quarantined transactions (a process known as "transaction quarantine escalation"), then the database automatically sets the value of this parameter to `DISABLED`. When this happens, the DBA should take corrective action for the quarantined transactions, then restart transaction recovery for the PDB by setting the value of this parameter to `ENABLED`. Refer to *Oracle Database Administrator's Guide* to learn about this entire process before you set this parameter.
- While working to resolve an issue, Oracle Support may instruct a DBA to temporarily disable transaction recovery by setting this parameter to `DISABLED`. After the issue has been resolved, this parameter should ultimately be set back to `ENABLED` so that normal database operation can resume.

 **Caution:**

You should never set this parameter to `DISABLED` unless specifically directed to do so by Oracle Support. Setting this parameter to `DISABLED` could lead to severe problems

 **Note:**

This parameter is available starting with Oracle Database 23ai.

## 2.408 TRANSACTIONS

`TRANSACTIONS` specifies how many rollback segments to online when `UNDO_MANAGEMENT = MANUAL`.

| Property                   | Description                             |
|----------------------------|-----------------------------------------|
| <b>Parameter type</b>      | Integer                                 |
| <b>Default value</b>       | Derived: (1.1 * <code>SESSIONS</code> ) |
| <b>Modifiable</b>          | No                                      |
| <b>Modifiable in a PDB</b> | No                                      |
| <b>Range of values</b>     | 4 to $2^{31} - 1$                       |
| <b>Basic</b>               | No                                      |

| Property   | Description                                   |
|------------|-----------------------------------------------|
| Oracle RAC | Multiple instances can have different values. |

The maximum number of concurrent transactions is now restricted by undo tablespace size (UNDO\_MANAGEMENT = AUTO) or the number of online rollback segments (UNDO\_MANAGEMENT = MANUAL).

## 2.409 TRANSACTIONS\_PER\_ROLLBACK\_SEGMENT

TRANSACTIONS\_PER\_ROLLBACK\_SEGMENT specifies the number of concurrent transactions you expect each rollback segment to have to handle.

| Property            | Description                                   |
|---------------------|-----------------------------------------------|
| Parameter type      | Integer                                       |
| Default value       | 5                                             |
| Modifiable          | No                                            |
| Modifiable in a PDB | No                                            |
| Range of values     | 1 to operating system-dependent               |
| Basic               | No                                            |
| Oracle RAC          | Multiple instances can have different values. |

The minimum number of rollback segments acquired at startup is TRANSACTIONS divided by the value for this parameter. For example, if TRANSACTIONS is 101 and this parameter is 10, then the minimum number of rollback segments acquired would be the ratio 101/10, rounded up to 11.

You can acquire more rollback segments by naming them in the parameter ROLLBACK\_SEGMENTS.

### See Also:

Your operating system-specific Oracle documentation for the range of values for this parameter.

## 2.410 TRUE\_CACHE

Use TRUE\_CACHE to specify that an instance is a True Cache.

| Property            | Description  |
|---------------------|--------------|
| Parameter type      | Boolean      |
| Default value       | false        |
| Modifiable          | No           |
| Modifiable in a PDB | No           |
| Range of values     | true   false |

| Property | Description |
|----------|-------------|
| Basic    | No          |

Set this parameter to `true` on a True Cache. Otherwise, leave this parameter set to `false`.

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

*Oracle True Cache User's Guide* for more information about this parameter

## 2.411 TXN\_PRIORITY

TXN\_PRIORITY specifies the priority for all user transactions in a session.

| Property            | Description                            |
|---------------------|----------------------------------------|
| Parameter type      | String                                 |
| Syntax              | TXN_PRIORITY = { HIGH   MEDIUM   LOW } |
| Default value       | HIGH                                   |
| Modifiable          | ALTER SESSION                          |
| Modifiable in a PDB | No                                     |
| Basic               | No                                     |

The Priority Transactions feature automatically rolls back low-priority transactions that are blocking higher priority transactions from obtaining row locks.

You can use the TXN\_PRIORITY parameter to assign a priority (HIGH, MEDIUM, or LOW) to all transactions in a particular user session. Priority Transactions then operates as follows for the three priorities:

- **HIGH** - Priority Transactions never rolls back a HIGH priority transaction in order to release a row lock for another transaction. This is the default.
- **MEDIUM** - Priority Transactions will roll back a MEDIUM priority transaction if it is holding a row lock required by a HIGH priority transaction, and the HIGH priority transaction has been waiting for the row lock longer than the time specified by the PRIORITY\_TXNS\_HIGH\_WAIT\_TARGET parameter.
- **LOW** - Priority Transactions will roll back a LOW priority transaction if it is holding a row lock required by a HIGH or MEDIUM priority transaction, and the HIGH or MEDIUM priority transaction has been waiting for the row lock longer than the time specified by the PRIORITY\_TXNS\_HIGH\_WAIT\_TARGET or PRIORITY\_TXNS\_MEDIUM\_WAIT\_TARGET parameter, respectively.

If a `LOW` priority transaction is blocked waiting for a row lock, Priority Transactions will not roll back the transaction holding the row lock, regardless of its priority.

You can view the priority and maximum wait time for a transaction by querying the `TXN_PRIORITY` and `PRIORITY_TXNS_WAIT_TARGET` columns in the `V$TRANSACTION` view.

**Note:**

This parameter is available starting with Oracle Database 23ai.

**See Also:**

- `"PRIORITY_TXNS_HIGH_WAIT_TARGET"`
- `"PRIORITY_TXNS_MEDIUM_WAIT_TARGET"`
- `"PRIORITY_TXNS_MODE"`
- `"V$TRANSACTION"`
- *Oracle Database Administrator's Guide* for more information about Priority Transactions

## 2.412 UNDO\_MANAGEMENT

`UNDO_MANAGEMENT` specifies which undo space management mode the system should use.

| Property            | Description                                      |
|---------------------|--------------------------------------------------|
| Parameter type      | String                                           |
| Syntax              | <code>UNDO_MANAGEMENT = { MANUAL   AUTO }</code> |
| Default value       | <code>AUTO</code>                                |
| Modifiable          | No                                               |
| Modifiable in a PDB | Yes                                              |
| Basic               | No                                               |
| Oracle RAC          | Multiple instances must have the same value.     |

When `UNDO_MANAGEMENT` is set to `AUTO`, the instance starts in automatic undo management mode. In manual undo management mode, undo space is allocated externally as rollback segments.

**Note:**

In a CDB, the `UNDO_MANAGEMENT` initialization parameter must be set to `AUTO`, and an undo tablespace is required to be created to manage the undo data.

**See Also:**

- *Oracle Database Administrator's Guide* for more information about this parameter
- *Oracle Database Administrator's Guide* for more information about managing undo data

## 2.413 UNDO\_RETENTION

UNDO\_RETENTION specifies (in seconds) the low threshold value of undo retention.

| Property            | Description                                                    |
|---------------------|----------------------------------------------------------------|
| Parameter type      | Integer                                                        |
| Default value       | 900                                                            |
| Modifiable          | ALTER SYSTEM                                                   |
| Modifiable in a PDB | Yes                                                            |
| Range of values     | 0 to $2^{31} - 1$                                              |
| Basic               | No                                                             |
| Oracle RAC          | Oracle recommends that multiple instances have the same value. |

For both AUTOEXTEND undo tablespaces and fixed-size undo tablespaces, the system retains undo for at least the time specified in this parameter, and automatically tunes the undo retention period to satisfy the undo requirements of the queries.

Automatic tuning of undo retention is not supported for LOBs. The RETENTION value for LOB columns is set to the value of the UNDO\_RETENTION parameter.

The UNDO\_RETENTION parameter is honored only if the current undo tablespace has enough space. If an active transaction requires undo space and the undo tablespace does not have available space, then the system starts reusing unexpired undo space. This action can potentially cause some queries to fail with a "snapshot too old" message.

The amount of time for which undo is retained for the Oracle Database for the current undo tablespace can be obtained by querying the TUNED\_UNDORETENTION column of the V\$UNDOSTAT dynamic performance view.

### Recommendations for Modifying UNDO\_RETENTION

Oracle generally recommends that you leave UNDO\_RETENTION set to its default value. Modifying this parameter is recommended only in the following situations:

- You may want to increase the value of UNDO\_RETENTION when using flashback features, such as Oracle Flashback Query, which require undo to be retained for longer than the longest running query in the system.
- In Oracle Active Data Guard environments, you may want to increase the value of UNDO\_RETENTION on the primary instance in order to accommodate undo retention requirements on the standby instances. This allows the primary instance to retain undo for a longer period of time to serve queries on the standby instances. For more information, see *Oracle Database Administrator's Guide* and *Oracle Data Guard Concepts and Administration*.

## Modifying UNDO\_RETENTION in a CDB

You can set the value of `UNDO_RETENTION` in the CDB root (`CDB$ROOT`) and in individual PDBs. The CDB root and PDBs can have the same value or different values. Note that you can modify this parameter in a PDB only if the PDB is in local undo mode; you cannot modify this parameter if the PDB is in shared undo mode.

Starting with Oracle Database release 19c, version 19.9, the value of `UNDO_RETENTION` is not inherited in a CDB. Therefore, if you change the value for `UNDO_RETENTION` in the CDB root, the PDBs do not inherit the new value. If you want to change the value for `UNDO_RETENTION` at the PDB level, you must explicitly do so. For example, if your CDB contains two PDBs (PDB1 and PDB2), you can set `UNDO_RETENTION` to 2000 in the CDB root and both PDBs as follows:

```
ALTER SESSION SET CONTAINER = CDB$ROOT;
ALTER SYSTEM SET UNDO_RETENTION=2000 SCOPE=BOTH;

ALTER SESSION SET CONTAINER = PDB1;
ALTER SYSTEM SET UNDO_RETENTION=2000 SCOPE=BOTH;

ALTER SESSION SET CONTAINER = PDB2;
ALTER SYSTEM SET UNDO_RETENTION=2000 SCOPE=BOTH;
```

### See Also:

## 2.414 UNDO\_TABLESPACE

`UNDO_TABLESPACE` specifies the undo tablespace to be used when an instance starts. If this parameter is specified when the instance is in manual undo management mode, then an error will occur and startup will fail.

| Property                   | Description                                                                |
|----------------------------|----------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                     |
| <b>Syntax</b>              | <code>UNDO_TABLESPACE = undoname</code>                                    |
| <b>Default value</b>       | The first available undo tablespace in the database.                       |
| <b>Modifiable</b>          | <code>ALTER SYSTEM</code>                                                  |
| <b>Modifiable in a PDB</b> | Yes                                                                        |
| <b>Range of values</b>     | Legal name of an existing undo tablespace                                  |
| <b>Basic</b>               | Yes                                                                        |
| <b>Oracle RAC</b>          | Each instance must have a unique value for this parameter, when it is set. |

If the `UNDO_TABLESPACE` parameter is omitted, the first available undo tablespace in the database is chosen. If no undo tablespace is available, the instance will start without an undo

tablespace. In such cases, user transactions will be executed using the `SYSTEM` rollback segment. You should avoid running in this mode under normal circumstances.

You can replace an undo tablespace with another undo tablespace while the instance is running.

**Note:**

When you update this parameter on the primary database in an Oracle Data Guard configuration, you must also update it on all the physical standby databases in the configuration. This ensures that the standby databases can find the undo tablespace when they become the primary database.

**See Also:**

*Oracle Database SQL Language Reference* for information about creating undo tablespaces

## 2.415 UNIFIED\_AUDIT\_COMMON\_SYSTEMLOG

`UNIFIED_AUDIT_COMMON_SYSTEMLOG` specifies whether key fields of unified audit records generated due to common audit policies will be written to the SYSLOG utility.

**Note:**

This initialization parameter is supported only on UNIX platforms.

| Property                   | Description                                                                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                                                                                                                                                                                         |
| <b>Syntax</b>              | <pre>UNIFIED_AUDIT_COMMON_SYSTEMLOG =<br/>'facility_clause.priority_clause'<br/>facility_clause::=<br/>{ USER   LOCAL[ 0   1   2   3   4   5   6   7 ] }<br/>priority_clause::=<br/>{ NOTICE   INFO   DEBUG   WARNING   ERR   CRIT   ALERT  <br/>EMERG }</pre> |
| <b>Default value</b>       | None                                                                                                                                                                                                                                                           |
| <b>Modifiable</b>          | No                                                                                                                                                                                                                                                             |
| <b>Modifiable in a PDB</b> | No                                                                                                                                                                                                                                                             |
| <b>Basic</b>               | No                                                                                                                                                                                                                                                             |
| <b>Oracle RAC</b>          | The same value must be used on all instances.                                                                                                                                                                                                                  |

When this parameter is set, key fields of unified audit records generated due to common audit policies are written to SYSLOG. These fields uniquely identify the detailed unified audit records in the `UNIFIED_AUDIT_TRAIL` view. Only a subset of unified audit record fields are written to

ensure that the audit record entries do not exceed the maximum allowed size for a SYSLOG entry (typically 1024 bytes).

Do not set this parameter if you do not want key fields of unified audit records generated due to common audit policies written to SYSLOG.

This parameter differs from the `UNIFIED_AUDIT_SYSTEMLOG` parameter in that it is set at the CDB level and enables all unified audit records from common unified audit policies to be consolidated into a single destination, whereas `UNIFIED_AUDIT_SYSTEMLOG` is set at the PDB level and enables the logging of unified audit records on a per-PDB basis.

 **See Also:**

- `"UNIFIED_AUDIT_SYSTEMLOG"`
- `"UNIFIED_AUDIT_TRAIL"`

## 2.416 UNIFIED\_AUDIT\_SYSTEMLOG

`UNIFIED_AUDIT_SYSTEMLOG` specifies whether key fields of unified audit records will be written to the SYSLOG utility (on UNIX platforms) or to the Windows Event Viewer (on Windows). In a CDB, this parameter is a per-PDB static initialization parameter.

| Property                   | Description                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String for UNIX platforms, Boolean for Windows                                                                                                                                                                                                                                                                                                                              |
| <b>Syntax</b>              | <b>On UNIX:</b><br><code>UNIFIED_AUDIT_SYSTEMLOG = 'facility_clause.priority_clause'</code><br><code>facility_clause::=</code><br>{ USER   LOCAL[ 0   1   2   3   4   5   6   7 ] }<br><code>priority_clause::=</code><br>{ NOTICE   INFO   DEBUG   WARNING   ERR   CRIT   ALERT   EMERG }<br><b>On Windows:</b><br><code>UNIFIED_AUDIT_SYSTEMLOG = { FALSE   TRUE }</code> |
| <b>Default value</b>       | No default on UNIX platforms<br>FALSE on Windows                                                                                                                                                                                                                                                                                                                            |
| <b>Modifiable</b>          | No                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Modifiable in a PDB</b> | Yes                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Basic</b>               | No                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Oracle RAC</b>          | The same value must be used on all instances.                                                                                                                                                                                                                                                                                                                               |

When this parameter is set on UNIX, key fields of unified audit records are written to SYSLOG. When this parameter is set on Windows, key fields of unified audit records are written to the Windows Event Viewer.

Do not set this parameter (or set it to `FALSE` on Windows) if you do not want key fields of unified audit records written to SYSLOG or the Windows Event Viewer.

When `UNIFIED_AUDIT_SYSTEMLOG` is enabled, the key fields of the unified audit records that are written to SYSLOG or Windows Event Viewer uniquely identify the detailed unified audit records in the `UNIFIED_AUDIT_TRAIL` view. Only a subset of the unified audit record fields are written to ensure that the audit record entries do not exceed the maximum allowed size for a SYSLOG entry (typically 1024 bytes).

This parameter differs from the `UNIFIED_AUDIT_COMMON_SYSTEMLOG` parameter in that it is set at the PDB level and enables the logging of unified audit records on a per-PDB basis, whereas `UNIFIED_AUDIT_COMMON_SYSTEMLOG` is set at the CDB level and enables all unified audit records from common unified audit policies to be consolidated into a single destination.

 **See Also:**

- `"UNIFIED_AUDIT_COMMON_SYSTEMLOG"`
- `"UNIFIED_AUDIT_TRAIL"`
- *Oracle Database Security Guide* for a table that maps the names given to the unified audit records fields that are written to SYSLOG and the Windows Event Viewer to the corresponding column names in the `UNIFIED_AUDIT_TRAIL` view

## 2.417 UNIFORM\_LOG\_TIMESTAMP\_FORMAT

`UNIFORM_LOG_TIMESTAMP_FORMAT` specifies that a uniform timestamp format be used in Oracle Database trace (.trc) files and log files (such as the alert log).

| Property                   | Description                                   |
|----------------------------|-----------------------------------------------|
| <b>Parameter type</b>      | Boolean                                       |
| <b>Default value</b>       | <code>true</code>                             |
| <b>Modifiable</b>          | <code>ALTER SYSTEM</code>                     |
| <b>Modifiable in a PDB</b> | No                                            |
| <b>Range of values</b>     | <code>true   false</code>                     |
| <b>Basic</b>               | No                                            |
| <b>Oracle RAC</b>          | Multiple instances should use the same value. |

When the value of `UNIFORM_LOG_TIMESTAMP_FORMAT` is `TRUE`, the format used for timestamps in trace files is standardized on universal time with millisecond precision. For example:

```
2012-09-26 00:16:47.154
```

When the value of `UNIFORM_LOG_TIMESTAMP_FORMAT` is `FALSE`, trace files include a mix of timestamps using different precisions, with some timestamps showing local time and other timestamps showing universal time.

## 2.418 USE\_DEDICATED\_BROKER

USE\_DEDICATED\_BROKER determines how dedicated servers are spawned.

### Note:

Starting with Oracle Database 23ai, the type for this parameter is changed from `Boolean` to `String`, the `NONE` and `CDB` values are introduced, and the default value is changed from `FALSE` to `NONE`. However, there is no change to the functionality of this parameter, because the `NONE` value is equivalent to `FALSE`, and the `CDB` value is equivalent to `TRUE`.

| Property            | Description                                              |
|---------------------|----------------------------------------------------------|
| Parameter type      | String                                                   |
| Syntax              | USE_DEDICATED_BROKER = { NONE   FALSE   CDB   TRUE }     |
| Default value       | NONE unless multithreaded Oracle is enabled <sup>1</sup> |
| Modifiable          | ALTER SYSTEM                                             |
| Modifiable in a PDB | No                                                       |
| Basic               | No                                                       |
| Oracle RAC          | If specified, all instances must use the same value      |

<sup>1</sup> Multithreaded Oracle is enabled by setting the `THREADED_EXECUTION` initialization parameter to `TRUE`.

When this parameter is set to `NONE` or `FALSE`, the listener spawns a dedicated server directly.

When this parameter is set to `CDB` or `TRUE`, the listener hands the connection to a dedicated connection broker that spawns the dedicated server. Unlike the listener, the dedicated connection broker is a database process, and hence it can implement policies leveraging database information before the spawn.

To enable the dedicated connection broker using the `USE_DEDICATED_BROKER` initialization parameter, you must:

1. Set the `USE_DEDICATED_BROKER` initialization parameter to `TRUE`.
2. Set the `DEDICATED_THROUGH_BROKER_listener-name` parameter to `on` in the `listener.ora` file.

Performing these two steps configures the Connection Broker Process (`Nnnn`).

### Note:

When multithreaded Oracle is enabled, the dedicated connection broker process is also enabled and used.

Configuration of the brokers is controlled by the `CONNECTION_BROKERS` initialization parameter.

 **See Also:**

- ["CONNECTION\\_BROKERS"](#) for more information about configuring brokers
- [Table F-1](#) for more information about the Connection Broker Process (Nnnn)
- ["THREADED\\_EXECUTION"](#) for more information about enabling multithreaded Oracle
- *Oracle Database Net Services Reference* for more information about the `DEDICATED_THROUGH_BROKER_listener-name` parameter in the listener.ora file

## 2.419 USE\_LARGE\_PAGES

USE\_LARGE\_PAGES is used to manage the database's use of large pages for SGA memory.

 **Note:**

This parameter is applicable only on the Linux operating system. However, setting this parameter to `FALSE` can cause performance degradation on any platform.

| Property                   | Description                                                                                                                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                                                                                                                                                |
| <b>Syntax</b>              | USE_LARGE_PAGES = { TRUE   FALSE   AUTO   ONLY   AUTO_ONLY }                                                                                                                                          |
| <b>Default value</b>       | ONLY for Exadata Database Service in the cloud and Base Database Service in the cloud<br>AUTO_ONLY for on-premises Exadata systems running Oracle Database 19c or later<br>TRUE for all other systems |
| <b>Modifiable</b>          | No                                                                                                                                                                                                    |
| <b>Modifiable in a PDB</b> | No                                                                                                                                                                                                    |
| <b>Basic</b>               | No                                                                                                                                                                                                    |
| <b>Oracle RAC</b>          | Multiple instances can use different values                                                                                                                                                           |

This parameter does not affect process-private memory allocations.

### Values

These values can be specified for USE\_LARGE\_PAGES:

- `TRUE`  
Specifies that the instance can use large pages if large pages are configured on the system.  
  
In Oracle Database 11g Release 2 (11.2.0.2), if there are not enough large pages configured on the system, then regular sized pages will be used to allocate SGA memory. This can cause the free large pages to go unused, and the operating system can allocate a huge amount of memory to create page tables to map SGA into physical pages for the

Oracle processes. This may lead to ORA-04030 errors and severe performance degradation on an instance.

In Oracle Database 11g Release 2 (11.2.0.3) and later releases, Oracle allocates as much of the SGA as it can in large pages, and if it runs out, it will allocate the rest of the SGA using regular sized pages. This can cause the instance to create additional shared memory segments for the SGA, but the total SGA size will be unchanged. In this supported mixed page mode allocation, the database will exhaust the available large pages before switching to regular sized pages.

- FALSE

Specifies that the instance will not use large pages. This setting is not recommended because it can cause severe performance degradation for the instance. Although the `USE_LARGE_PAGES` initialization parameter applies only to Linux systems, setting this parameter to `FALSE` can cause performance degradation on any platform.

- AUTO

Specifies that, during startup, the instance will calculate and request the number of large pages it requires. If the operating system cannot fulfill this request, then the instance will start with a combination of large and regular pages.

- ONLY

Specifies that the instance will fail to start if large pages cannot be used for the entire SGA memory. Oracle recommends this setting for consistent performance. This setting is the default setting for Exadata Database Service in the cloud and Base Database Service in the cloud.

- AUTO\_ONLY

Specifies that, during startup, the instance will calculate and request the number of large pages it requires. If the operating system can fulfill this request, then the instance will start successfully. If the operating system cannot fulfill this request, then the instance will fail to start. This ensures that no instances will run with under-provisioned large pages. This setting is available starting with Oracle Database 19c and it is the default setting for on-premises Exadata systems.

**Note:**

`USE_LARGE_PAGES` is set to `FALSE` automatically in an Oracle ASM instance when `MEMORY_TARGET` is enabled. In this case, the `FALSE` setting does not cause performance degradation.

## 2.420 USER\_DUMP\_DEST

`USER_DUMP_DEST` specifies the pathname for a directory where the server will write debugging trace files on behalf of a user process.

| Property       | Description                                                          |
|----------------|----------------------------------------------------------------------|
| Parameter type | String                                                               |
| Syntax         | <code>USER_DUMP_DEST = { <i>pathname</i>   <i>directory</i> }</code> |
| Default value  | Operating system-dependent                                           |

| Property                   | Description                              |
|----------------------------|------------------------------------------|
| <b>Modifiable</b>          | ALTER SYSTEM                             |
| <b>Modifiable in a PDB</b> | No                                       |
| <b>Range of values</b>     | Any valid local path, directory, or disk |
| <b>Basic</b>               | No                                       |

**Note:**

The `USER_DUMP_DEST` initialization parameter is deprecated.

For example, this directory might be set as follows:

- On MS-DOS: `C:\ORACLE\UTRC`
- On UNIX: `/oracle/utrc`
- On VMS: `DISK$UR3:[ORACLE.UTRC]`

**Note:**

This parameter is ignored by the diagnosability infrastructure introduced in Oracle Database 11g Release 1 (11.1), which places trace and core files in a location controlled by the `DIAGNOSTIC_DEST` initialization parameter.

**See Also:**

- *Oracle Database SQL Tuning Guide* for more information about the use of trace files
- Your operating system-specific Oracle documentation for the range of values

## 2.421 WALLET\_ROOT

`WALLET_ROOT` specifies the path to the root of a directory tree containing a subdirectory for each pluggable database (PDB).

| Property                   | Description                                           |
|----------------------------|-------------------------------------------------------|
| <b>Parameter type</b>      | String                                                |
| <b>Syntax</b>              | <code>WALLET_ROOT = wallet-root-directory-path</code> |
| <b>Default value</b>       | There is no default value.                            |
| <b>Modifiable</b>          | No                                                    |
| <b>Modifiable in a PDB</b> | No                                                    |
| <b>Basic</b>               | No                                                    |

| Property   | Description                                  |
|------------|----------------------------------------------|
| Oracle RAC | Multiple instances must have the same value. |

The name of the various wallet files is always the same, regardless of the component they are associated with. The wallets for each component are stored under each PDB GUID directory within the `WALLET_ROOT` directory structure in a directory whose name is based on the component name. For example, for the TDE component, the subdirectory name is `tde`.

The `TDE_CONFIGURATION` initialization parameter cannot be set unless the `WALLET_ROOT` parameter is also set.

For example, the contents of the directory at the location specified by the `WALLET_ROOT` initialization parameter could look as follows, where *wallet-root* is the directory specified by the `WALLET_ROOT` parameter:

```
wallet-root/eus/ewallet.p12
wallet-root/tde/ewallet.p12
wallet-root/tde/ewallet_2016120918333644.p12
wallet-root/tde_seps/cwallet.sso
wallet-root/tls/ewallet.p12
wallet-root/xdw_wallet/ewallet.p12
wallet-root/3FD1C95B48205D0FE053C5A0E40AEF8C/tde/ewallet.p12
wallet-root/3FD1C95B48205D0FE053C5A0E40AEF8C/tde/ewallet_2016110918331622.p12
wallet-root/3FD1C95B48205D0FE053C5A0E40AEF8C/tde/ewallet_2016110918332363.p12
wallet-root/3FD1C95B48205D0FE053C5A0E40AEF8C/tde_seps/cwallet.sso
wallet-root/3FD1C95B48205D0FE053C5A0E40AEF8C/tls/cwallet.sso
wallet-root/3FD1C95B48205D0FE053C5A0E40AEF8C/tls/ewallet.p12
```

When the `WALLET_ROOT` parameter is set, you can omit the path from some `ADMINISTER KEY MANAGEMENT` commands.

The `WALLET_ROOT` value can include references to environment variables. The following example shows how to use `WALLET_ROOT` when multiple TDE-enabled databases are installed into the same `ORACLE_HOME`:

```
WALLET_ROOT=/etc/ORACLE/KEYSTORES/$ORACLE_SID
```

The `ORACLE_SID` environment variable (or the `DB_UNIQUE_NAME` environment variable for Oracle RAC) makes sure that each database that is installed into the same `ORACLE_HOME` has its own set of wallets and TDE keys. This sets the root of the wallet directory hierarchy to the directory specified by `wallet-root-directory-path`.

**Note:**

The normalized length of the `wallet-root-directory-name` that is specified with the `WALLET_ROOT` parameter cannot exceed 255 characters, otherwise one of the following sets of error messages is displayed:

```
ORA-46693: The WALLET_ROOT location is missing or invalid.
ORA-32021: parameter value longer than 255 characters
ORA-01078: failure in processing system parameters
```

```
ORA-46693: The WALLET_ROOT location is missing or invalid.
ORA-07204: sltln: name translation failed due to lack of output
buffer space.
ORA-01078: failure in processing system parameters
```

The normalized length includes the length of expanded environment variables specified with the `WALLET_ROOT` parameter. The values of the environment variables of the user who starts the instance are used in the normalization of the `WALLET_ROOT` parameter.

The `SHOW PARAMETER WALLET_ROOT` command always displays the normalized value (with all the environment variables expanded).

For non-ASM file systems, the PDB GUID-extended paths for the TDE component are created automatically under the directory specified by the `WALLET_ROOT` parameter when any Transparent Data Encryption (TDE) wallet is created for a PDB.

### Enabling Automatic Creation of Directories Under `WALLET_ROOT`

By using the specific configuration of `WALLET_ROOT` described in each of the following sub-sections, Oracle Database can be configured to automatically create the necessary *pdb-guid* and *component name* directories under the `WALLET_ROOT` directory path. Other settings of `WALLET_ROOT` are allowed, but would not result in the automatic creation of the necessary sub-directories by the ASM OMF layer.

### Required setting to enable auto-directory creation for a database not using Oracle ASM

For a database not using Oracle ASM filesystems, the `WALLET_ROOT` parameter needs to be set as follows:

```
WALLET_ROOT=wallet-root-directory-path
```

This sets the root of the wallet directory hierarchy to the directory specified by `wallet-root-directory-path`. For example:

```
/etc/ORACLE/KEYSTORES/FINANCE
```

When this is done, Oracle Database automatically creates the directory for the TDE wallet of a CDB\$ROOT at the following location:

```
/etc/ORACLE/KEYSTORES/FINANCE/tde
```

The directories, that Oracle Database automatically creates for holding the TDE wallets of isolated PDBs, will include the *pdb-guid*. For example:

```
/etc/ORACLE/KEYSTORES/FINANCE/3FD1C95B48205D0FE053C5A0E40AEF8C/tde
```

### Required setting to enable auto-directory creation for a database using Oracle ASM with Oracle Managed Files

For a database using ASM with OMF, the `WALLET_ROOT` parameter needs to begin with a plus sign followed by a disk group name and the value of the `DB_UNIQUE_NAME` initialization parameter. In the example below, `DATA` is the name of a disk group and `FINRAC` is the value of the `DB_UNIQUE_NAME` initialization parameter:

```
WALLET_ROOT=+DATA/FINRAC
```

When this is done, Oracle Database automatically creates the necessary directory within the ASM filesystem at the following location when the `ADMINISTER KEY MANAGEMENT CREATE KEYSTORE` command is run:

```
+DATA/FINRAC/tde
```

For isolated PDBs, the directories that Oracle Database automatically creates for holding the TDE wallets of PDBs will include the *pdb-guid*. For example:

```
+DATA/FINRAC/3FD1C95B48205D0FE053C5A0E40AEF8C/tde
```

### Required setting to enable auto-directory creation for RAC-enabled databases

For a RAC-enabled database, only shared TDE wallets are supported (as opposed to individual TDE-wallets per RAC instance). `WALLET_ROOT` can either point to an ASM disk group, or a directory in ACFS. If the `WALLET_ROOT` parameter points to *+diskgroup/dbname*, then the `/tde` sub-directory is automatically created when issuing an `ADMINISTER KEY MANAGEMENT CREATE KEYSTORE` command. For example, when `WALLET_ROOT` is set to `+DATA/FINANCE`, the directory `+DATA/FINANCE/tde` is automatically created. This guarantees that when multiple databases are installed, their TDE-wallets are kept separate.

["TDE\\_CONFIGURATION"](#)

## 2.422 WORKAREA\_SIZE\_POLICY

`WORKAREA_SIZE_POLICY` specifies the policy for sizing work areas. This parameter controls the mode in which working areas are tuned.

| Property            | Description                                           |
|---------------------|-------------------------------------------------------|
| Parameter type      | String                                                |
| Syntax              | <code>WORKAREA_SIZE_POLICY = { AUTO   MANUAL }</code> |
| Default value       | AUTO                                                  |
| Modifiable          | ALTER SESSION, ALTER SYSTEM                           |
| Modifiable in a PDB | Yes                                                   |
| Basic               | No                                                    |

## Values

You can specify the following values for `WORKAREA_SIZE_POLICY`:

- `AUTO`

When `AUTO` is specified, work areas used by memory-intensive operators are sized automatically, based on the PGA memory used by the system, the target PGA memory set in `PGA_AGGREGATE_TARGET`, and the requirement of each individual operator.

- `MANUAL`

When `MANUAL` is specified, the sizing of work areas is manual and based on the values of the `*_AREA_SIZE` parameter corresponding to the operation (for example, a sort uses `SORT_AREA_SIZE`). Specifying `MANUAL` may result in sub-optimal performance and poor PGA memory utilization.

### See Also:

*Oracle Database Performance Tuning Guide* for additional information on setting this parameter

## 2.423 XML\_DB\_EVENTS

`XML_DB_EVENTS` enables or disables XML DB events.

| Property                   | Description                                       |
|----------------------------|---------------------------------------------------|
| <b>Parameter type</b>      | String                                            |
| <b>Syntax</b>              | <code>XML_DB_EVENTS = { enable   disable }</code> |
| <b>Default value</b>       | <code>enable</code>                               |
| <b>Modifiable</b>          | <code>ALTER SESSION, ALTER SYSTEM</code>          |
| <b>Modifiable in a PDB</b> | Yes                                               |
| <b>Basic</b>               | No                                                |

Changing this parameter through an `ALTER SESSION` statement affects only the current session. Only users with the `XDBADMIN` role are allowed to change this parameter in a session.

Changing this parameter through an `ALTER SYSTEM` statement will make a systemwide change of this parameter; however, the change is only registered by new sessions started after the change. Currently running sessions need to be restarted to pick up the new change. Users must have the `ALTER SYSTEM` privilege to make a systemwide change.

### See Also:

*Oracle XML DB Developer's Guide* for more information about this parameter

## 2.424 XML\_PARAMS

XML\_PARAMS lets you adjust the behavior for XMLType data.

| Property                   | Description                                                                  |
|----------------------------|------------------------------------------------------------------------------|
| <b>Parameter type</b>      | String                                                                       |
| <b>Syntax</b>              | XML_PARAMS = "parameter=value [, parameter=value ] ..."                      |
| <b>Default value</b>       | None                                                                         |
| <b>Modifiable</b>          | ALTER SESSION, ALTER SYSTEM                                                  |
| <b>Modifiable in a PDB</b> | Yes                                                                          |
| <b>Basic</b>               | No                                                                           |
| <b>Oracle RAC</b>          | If specified, Oracle recommends that multiple instances have the same value. |

You can specify one of the following for *parameter=value*:

- `xml_default_storage_tbx=true`  
Sets the default XMLType storage to Transportable Binary XML (TBX) when no storage type is explicitly specified. Starting with Oracle Database 23ai, this is the default and recommended storage type for all XMLType data, even if this parameter is not set. Note that Transportable Binary XML must be stored as Securefiles LOBs.
- `xml_default_storage_tbx=false`  
Sets the default XMLType storage to Not-Transportable Binary XML (CSX) when no storage type is explicitly specified. This setting can be used as a workaround for applications that still rely on the CSX storage type. Not-Transportable Binary XML can be stored as Basicfiles LOBs or Securefiles LOBs.

### Example:

```
ALTER SYSTEM SET XML_PARAMS = "xml_default_storage_tbx=true";
```

### Note:

This parameter is available starting with Oracle Database 23ai.

# Part II

## Static Data Dictionary Views

This part describes data dictionary tables and views. These tables and views are called **static**, because they change only when a change is made to the data dictionary (for example, when a new table is created or when a user is granted new privileges).

This part contains the following chapters:

- [Static Data Dictionary Views: ALL\\_ALL\\_TABLES to ALL\\_OUTLINES](#)
- [Static Data Dictionary Views: ALL\\_PART\\_COL\\_STATISTICS to DATABASE\\_PROPERTIES](#)
- [Static Data Dictionary Views: DBA\\_2PC\\_NEIGHBORS to DBA\\_HIST\\_JAVA\\_POOL\\_ADVICE](#)
- [Static Data Dictionary Views: DBA\\_HIST\\_LATCH to DBA\\_STORED\\_SETTINGS](#)
- [Static Data Dictionary Views: DBA\\_STREAMS\\_ADD\\_COLUMN to USER\\_ZONEMAPS](#)

### Note:

Oracle also maintains views that monitor ongoing database activity. These **dynamic performance views** are described in [Dynamic Performance Views](#).

### Note:

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

# 3

## Static Data Dictionary Views: ALL\_ALL\_TABLES to ALL\_OUTLINES

This chapter describes the first set (in alphabetical order) of static data dictionary views.

The remaining static data dictionary views appear in alphabetical order in [Static Data Dictionary Views: ALL\\_PART\\_COL\\_STATISTICS to DATABASE\\_PROPERTIES](#) through [Static Data Dictionary Views: DBA\\_STREAMS\\_ADD\\_COLUMN to USER\\_ZONEMAPS](#).

This chapter contains the following topics:

- [About Static Data Dictionary Views](#)
- [AWR\\_PDB\\_\\* Views](#)
- [AWR\\_ROOT\\_\\* Views](#)
- [CDB\\_\\* Views](#)
- [DBA\\_HIST\\_\\* Views](#)
- [Oracle Database Real Application Security Views](#)
- [Oracle Database Vault Views](#)
- [Oracle Label Security Views](#)
- [Oracle Workspace Manager Views](#)
- [Recovery Catalog Views](#)
- [Static Data Dictionary View Descriptions](#)

### 3.1 About Static Data Dictionary Views

Data dictionary tables are not directly accessible, but you can access information in them through data dictionary views. To list the data dictionary views available to you, query the view `DICTIONARY`.

Many data dictionary tables have three corresponding views:

- An `ALL_` view displays all the information accessible to the current user, including information from the current user's schema as well as information from objects in other schemas, if the current user has access to those objects by way of grants of privileges or roles.
- A `DBA_` view displays all relevant information in the entire database. `DBA_` views are intended only for administrators. They can be queried only by users with the `SYSDBA` system privilege or `SELECT ANY DICTIONARY` privilege, or `SELECT_CATALOG_ROLE` role, or by users with direct privileges granted to them. The `SELECT ANY DICTIONARY` privilege is assigned to the `DBA` role when the system is initially installed.
- A `USER_` view displays all the information from the schema of the current user. No special privileges are required to query these views.

The columns of the `ALL_`, `DBA_`, and `USER_` views corresponding to a single data dictionary table are usually nearly identical. Therefore, these views are described in full only once in this

chapter, at their first occurrence alphabetically, and are listed without full descriptions at their other occurrences.

**See Also:**

"[Static Data Dictionary View Descriptions](#)" introduces the alphabetical listing of view descriptions that are documented in this manual

## 3.2 AWR\_PDB\_\* Views

The AWR\_PDB views show the local Automatic Workload Repository (AWR) data present on a CDB root or a PDB from where the AWR\_PDB views are accessed.

The AWR\_PDB views on a CDB root show the AWR data stored on the CDB root.

The AWR\_PDB views on a PDB show the AWR data stored on that PDB.

**See Also:**

- "[AWR\\_ROOT\\_\\* Views](#)"
- *Oracle Database Performance Tuning Guide* for an introduction to AWR
- *Oracle Database Performance Tuning Guide* for more information about AWR\_PDB views and related views for accessing AWR in a multitenant environment

## 3.3 AWR\_ROOT\_\* Views

The AWR\_ROOT views show the AWR data stored only on a CDB root. In general, the AWR\_ROOT views are equivalent to the DBA\_HIST views.

When the AWR\_ROOT views are accessed from a CDB root, they show the AWR data specific to the CDB root.

When the AWR\_ROOT views are accessed from a PDB, they show the AWR data specific to that PDB.

**See Also:**

- "[AWR\\_PDB\\_\\* Views](#)"
- *Oracle Database Performance Tuning Guide* for an introduction to AWR
- *Oracle Database Performance Tuning Guide* for more information about AWR\_ROOT views and related views for accessing AWR in a multitenant environment

## 3.4 CDB\_\* Views

For every DBA\_\* view, a CDB\_\* view is defined. In the root of a multitenant container database (CDB), CDB\_\* views can be used to obtain information about tables, tablespaces, users, privileges, parameters, and so on contained in the root and in pluggable databases (PDBs). The CDB\_\* views can be queried only by users with the SYSDBA system privilege or SELECT ANY DICTIONARY privilege, or SELECT\_CATALOG\_ROLE role, or by users with direct privileges granted to them.

CDB\_\* views are container data objects. When a user connected to the root queries a CDB\_\* view, the query results will depend on the CONTAINER\_DATA attribute for users for the view. The CONTAINER\_DATA clause of the SQL ALTER USER statement is used to set and modify users' CONTAINER\_DATA attribute.

The CDB\_\* views are owned by SYS, regardless of who owns the underlying DBA\_\* view.

By default, a user connected to the root will only see data pertaining to the root.

### See Also:

- *Oracle Database Security Guide* for more information about container data objects
- *Oracle Database SQL Language Reference* for more information about the CONTAINER\_DATA clause for the SQL ALTER USER statement

CDB\_\* views include these hidden columns:

- CON\$NAME: This column includes the name of the container whose data a given CDB\_\* row represents
- CDB\$NAME: This column displays the name of the CDB whose data a given CDB\_\* row represents

In a PDB, the CDB\_\* views only show objects visible through a corresponding DBA\_\* view.

In addition to all the columns found in a given DBA\_\* view, the corresponding CDB\_\* view also contains the CON\_ID column, which identifies a container whose data a given CDB\_\* row represents. In a non-CDB, the value of a CON\_ID column will be 0.

CDB views can return data from different containers in a CDB when queried from the root container. These objects will implicitly convert data to the character set of the root container (AL32UTF8) and then return the result to the user. Some character sets may have character expansion (more bytes needed to represent a character) when converted to AL32UTF8, so there may be data truncation if the view column width is not able to accommodate data from a given PDB.

Data is returned by these views from all open PDBs at the time the query is issued, except for PDBs that are open in RESTRICTED mode. In an Oracle RAC environment, data returned by these views may vary according to the instance to which a session is connected.

## 3.5 DBA\_HIST\_\* Views

The DBA\_HIST views show the local Automatic Workload Repository (AWR) data present on a CDB root or a PDB.

If a DBA\_HIST view is queried from a CDB root, the view shows all the AWR data stored on the CDB root.

If a DBA\_HIST view is queried from a PDB, the view shows the subset of the CDB root AWR data that is specific to that PDB. Also, the view shows the PDB level snapshots at that PDB, if they exist.

## 3.6 Oracle Database Real Application Security Views

This manual describes these Oracle Database Real Application Security auditing views:

- [DBA\\_XS\\_AUDIT\\_POLICY\\_OPTIONS](#)
- [DBA\\_XS\\_AUDIT\\_TRAIL](#)
- [DBA\\_XS\\_ENB\\_AUDIT\\_POLICIES](#)

Descriptions of the other Oracle Database Real Application Security views are provided in *Oracle Database Real Application Security Administrator's and Developer's Guide*.

### Note:

Oracle Database Real Application Security views include `_XS_` in the view name.

## 3.7 Oracle Database Vault Views

Descriptions of Oracle Database Vault views are not provided in this manual.

See *Oracle Database Vault Administrator's Guide* for descriptions of Oracle Database Vault views.

### Note:

Oracle Database Vault views include `_DV_` in the view name.

## 3.8 Oracle Label Security Views

Descriptions of Oracle Label Security views are not provided in this manual.

See *Oracle Label Security Administrator's Guide* for descriptions of Oracle Label Security views.

### Note:

Oracle Label Security views include `_SA_` in the view name.

## 3.9 Oracle Workspace Manager Views

A number of data dictionary views are relevant only if you are using Oracle Workspace Manager:

- `ALL_MP_GRAPH_WORKSPACES` **and** `USER_MP_GRAPH_WORKSPACES`
- `ALL_MP_PARENT_WORKSPACES` **and** `USER_MP_PARENT_WORKSPACES`
- `ALL_REMOVED_WORKSPACES` **and** `USER_REMOVED_WORKSPACES`
- `ALL_VERSION_HVIEW`
- `ALL_WM_CONS_COLUMNS` **and** `USER_WM_CONS_COLUMNS`
- `ALL_WM_CONSTRAINTS` **and** `USER_WM_CONSTRAINTS`
- `ALL_WM_IND_COLUMNS` **and** `USER_WM_IND_COLUMNS`
- `ALL_WM_IND_EXPRESSIONS` **and** `USER_WM_IND_EXPRESSIONS`
- `ALL_WM_LOCKED_TABLES` **and** `USER_WM_LOCKED_TABLES`
- `ALL_WM_MODIFIED_TABLES` **and** `USER_WM_MODIFIED_TABLES`
- `ALL_WM_RIC_INFO` **and** `USER_WM_RIC_INFO`
- `ALL_WM_TAB_TRIGGERS` **and** `USER_WM_TAB_TRIGGERS`
- `ALL_WM_VERSIONED_TABLES` **and** `USER_WM_VERSIONED_TABLES`
- `ALL_WM_VT_ERRORS`, `DBA_WM_VT_ERRORS`, **and** `USER_WM_VT_ERRORS`
- `ALL_WORKSPACE_PRIVS` **and** `USER_WORKSPACE_PRIVS`
- `ALL_WORKSPACE_SAVEPOINTS` **and** `USER_WORKSPACE_SAVEPOINTS`
- `ALL_WORKSPACES`, `DBA_WORKSPACES`, **and** `USER_WORKSPACES`
- `DBA_WM_SYS_PRIVS`
- `DBA_WORKSPACE_SESSIONS`
- `ROLE_WM_PRIVS`
- `USER_WM_PRIVS`
- `WM_COMPRESS_BATCH_SIZES`
- `WM_COMPRESSIBLE_TABLES`

- WM\_EVENTS\_INFO
- WM\_INSTALLATION

**See Also:**

*Oracle Database Workspace Manager Developer's Guide* for information about these views

## 3.10 Recovery Catalog Views

The following data dictionary views are only available after you create an optional recovery catalog (which contains schemas containing information about backups) for use with Recovery Manager:

RC\_ARCHIVED\_LOG  
RC\_BACKUP\_ARCHIVELOG\_DETAILS  
RC\_BACKUP\_ARCHIVELOG\_SUMMARY  
RC\_BACKUP\_CONTROLFILE  
RC\_BACKUP\_CONTROLFILE\_DETAILS  
RC\_BACKUP\_CONTROLFILE\_SUMMARY  
RC\_BACKUP\_COPY\_DETAILS  
RC\_BACKUP\_COPY\_SUMMARY  
RC\_BACKUP\_CORRUPTION  
RC\_BACKUP\_DATAFILE  
RC\_BACKUP\_DATAFILE\_DETAILS  
RC\_BACKUP\_DATAFILE\_SUMMARY  
RC\_BACKUP\_FILES  
RC\_BACKUP\_PIECE  
RC\_BACKUP\_PIECE\_DETAILS  
RC\_BACKUP\_REDOLOG  
RC\_BACKUP\_SET  
RC\_BACKUP\_SET\_DETAILS  
RC\_BACKUP\_SET\_SUMMARY  
RC\_BACKUP\_SPFILE  
RC\_BACKUP\_SPFILE\_DETAILS  
RC\_BACKUP\_SPFILE\_SUMMARY  
RC\_CHECKPOINT  
RC\_CONTROLFILE\_COPY  
RC\_COPY\_CORRUPTION  
RC\_DATABASE  
RC\_DATABASE\_BLOCK\_CORRUPTION  
RC\_DATABASE\_INCARNATION  
RC\_DATAFILE  
RC\_DATAFILE\_COPY  
RC\_LOG\_HISTORY  
RC\_OFFLINE\_RANGE

RC\_PROXY\_ARCHIVEDLOG  
RC\_PROXY\_ARCHIVELOG\_DETAILS  
RC\_PROXY\_ARCHIVELOG\_SUMMARY  
RC\_PROXY\_CONTROLFILE  
RC\_PROXY\_COPY\_DETAILS  
RC\_PROXY\_COPY\_SUMMARY  
RC\_PROXY\_DATAFILE  
RC\_REDO\_LOG  
RC\_REDO\_THREAD  
RC\_RESTORE\_POINT  
RC\_RESYNC  
RC\_RMAN\_BACKUP\_JOB\_DETAILS  
RC\_RMAN\_BACKUP\_SUBJOB\_DETAILS  
RC\_RMAN\_BACKUP\_TYPE  
RC\_RMAN\_CONFIGURATION  
RC\_RMAN\_OUTPUT  
RC\_RMAN\_STATUS  
RC\_SITE  
RC\_STORED\_SCRIPT  
RC\_STORED\_SCRIPT\_LINE  
RC\_TABLESPACE  
RC\_TEMPFILE  
RC\_UNUSABLE\_BACKUPFILE\_DETAILS

## 3.11 Static Data Dictionary View Descriptions

The remainder of this chapter describes the static data dictionary views in alphabetical order.

## 3.12 ALL\_ALL\_TABLES

`ALL_ALL_TABLES` describes the object tables and relational tables accessible to the current user.

#### Related Views

- `DBA_ALL_TABLES` describes all object tables and relational tables in the database.
- `USER_ALL_TABLES` describes the object tables and relational tables owned by the current user. This view does not display the `OWNER` column.

| Column | Datatype       | NULL | Description        |
|--------|----------------|------|--------------------|
| OWNER  | VARCHAR2 (128) |      | Owner of the table |

| Column          | Datatype       | NULL | Description                                                                                                                                                                                                            |
|-----------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLE_NAME      | VARCHAR2 (128) |      | Name of the table                                                                                                                                                                                                      |
| TABLESPACE_NAME | VARCHAR2 (30)  |      | Name of the tablespace containing the table; NULL for partitioned, temporary, and index-organized tables                                                                                                               |
| CLUSTER_NAME    | VARCHAR2 (128) |      | Name of the cluster, if any, to which the table belongs                                                                                                                                                                |
| IOT_NAME        | VARCHAR2 (128) |      | Name of the index-organized table, if any, to which the overflow or mapping table entry belongs. If the IOT_TYPE column is not NULL, then this column contains the base table name.                                    |
| STATUS          | VARCHAR2 (8)   |      | If a previous DROP TABLE operation failed, indicates whether the table is unusable (UNUSABLE) or valid (VALID)                                                                                                         |
| PCT_FREE        | NUMBER         |      | Minimum percentage of free space in a block; NULL for partitioned tables                                                                                                                                               |
| PCT_USED        | NUMBER         |      | Minimum percentage of used space in a block; NULL for partitioned tables                                                                                                                                               |
| INI_TRANS       | NUMBER         |      | Initial number of transactions; NULL for partitioned tables                                                                                                                                                            |
| MAX_TRANS       | NUMBER         |      | Maximum number of transactions; NULL for partitioned tables                                                                                                                                                            |
| INITIAL_EXTENT  | NUMBER         |      | Size of the initial extent (in bytes); NULL for partitioned tables                                                                                                                                                     |
| NEXT_EXTENT     | NUMBER         |      | Size of secondary extents (in bytes); NULL for partitioned tables                                                                                                                                                      |
| MIN_EXTENTS     | NUMBER         |      | Minimum number of extents allowed in the segment; NULL for partitioned tables                                                                                                                                          |
| MAX_EXTENTS     | NUMBER         |      | Maximum number of extents allowed in the segment; NULL for partitioned tables                                                                                                                                          |
| PCT_INCREASE    | NUMBER         |      | Percentage increase in extent size; NULL for partitioned tables                                                                                                                                                        |
| FREELISTS       | NUMBER         |      | Number of process freelists allocated to the segment; NULL for partitioned tables                                                                                                                                      |
| FREELIST_GROUPS | NUMBER         |      | Number of freelist groups allocated to the segment                                                                                                                                                                     |
| LOGGING         | VARCHAR2 (3)   |      | Indicates whether or not changes to the table are logged: <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>                                                                                        |
| BACKED_UP       | VARCHAR2 (1)   |      | Indicates whether the table has been backed up since the last modification (Y) or not (N)                                                                                                                              |
| NUM_ROWS        | NUMBER         |      | Number of rows in the table                                                                                                                                                                                            |
| BLOCKS          | NUMBER         |      | Number of used blocks in the table                                                                                                                                                                                     |
| EMPTY_BLOCKS    | NUMBER         |      | Number of empty (never used) blocks in the table                                                                                                                                                                       |
| AVG_SPACE       | NUMBER         |      | Average available free space in the table                                                                                                                                                                              |
| CHAIN_CNT       | NUMBER         |      | Number of rows in the table that are chained from one data block to another or that have migrated to a new block, requiring a link to preserve the old rowid. This column is updated only after you analyze the table. |
| AVG_ROW_LEN     | NUMBER         |      | Average row length, including row overhead                                                                                                                                                                             |

| Column                    | Datatype       | NULL | Description                                                                                                                                                                                                                               |
|---------------------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVG_SPACE_FREELIST_BLOCKS | NUMBER         |      | Average freespace of all blocks on a freelist                                                                                                                                                                                             |
| NUM_FREELIST_BLOCKS       | NUMBER         |      | Number of blocks on the freelist                                                                                                                                                                                                          |
| DEGREE                    | VARCHAR2 (10)  |      | Number of threads per instance for scanning the table, or DEFAULT                                                                                                                                                                         |
| INSTANCES                 | VARCHAR2 (10)  |      | Number of instances across which the table is to be scanned, or DEFAULT                                                                                                                                                                   |
| CACHE                     | VARCHAR2 (5)   |      | Indicates whether the table is to be cached in the buffer cache (Y) or not (N)                                                                                                                                                            |
| TABLE_LOCK                | VARCHAR2 (8)   |      | Indicates whether table locking is enabled (ENABLED) or disabled (DISABLED)                                                                                                                                                               |
| SAMPLE_SIZE               | NUMBER         |      | Sample size used in analyzing the table                                                                                                                                                                                                   |
| LAST_ANALYZED             | DATE           |      | Date on which the table was most recently analyzed                                                                                                                                                                                        |
| PARTITIONED               | VARCHAR2 (3)   |      | Indicates whether the table is partitioned (YES) or not (NO)                                                                                                                                                                              |
| IOT_TYPE                  | VARCHAR2 (12)  |      | If the table is an index-organized table, then IOT_TYPE is IOT, IOT_OVERFLOW, or IOT_MAPPING. If the table is not an index-organized table, then IOT_TYPE is NULL.                                                                        |
| OBJECT_ID_TYPE            | VARCHAR2 (16)  |      | Indicates whether the object ID (OID) is USER-DEFINED or SYSTEM GENERATED                                                                                                                                                                 |
| TABLE_TYPE_OWNER          | VARCHAR2 (128) |      | If an object table, owner of the type from which the table is created                                                                                                                                                                     |
| TABLE_TYPE                | VARCHAR2 (128) |      | If an object table, type of the table                                                                                                                                                                                                     |
| TEMPORARY                 | VARCHAR2 (1)   |      | Indicates whether the table is temporary (Y) or not (N)                                                                                                                                                                                   |
| SECONDARY                 | VARCHAR2 (1)   |      | Indicates whether the table is a secondary object created by the ODCIIndexCreate method of the Oracle Data Cartridge to contain the contents of a domain index (Y) or not (N)                                                             |
| NESTED                    | VARCHAR2 (3)   |      | Indicates whether the table is a nested table (YES) or not (NO)                                                                                                                                                                           |
| BUFFER_POOL               | VARCHAR2 (7)   |      | Buffer pool to be used for table blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• RECYCLE</li> <li>• NULL</li> </ul>                                                                                   |
| FLASH_CACHE               | VARCHAR2 (7)   |      | Database Smart Flash Cache hint to be used for table blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> Solaris and Oracle Linux functionality only.                                     |
| CELL_FLASH_CACHE          | VARCHAR2 (7)   |      | Cell flash cache hint to be used for table blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> <b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |

| Column          | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROW_MOVEMENT    | VARCHAR2 (8)   |      | If a partitioned table, indicates whether row movement is enabled (ENABLED) or disabled (DISABLED)                                                                                                                                                                                                                                                                                                                                                                                                                             |
| GLOBAL_STATS    | VARCHAR2 (3)   |      | GLOBAL_STATS will be YES if statistics are gathered or incrementally maintained, otherwise it will be NO                                                                                                                                                                                                                                                                                                                                                                                                                       |
| USER_STATS      | VARCHAR2 (3)   |      | Indicates whether statistics were entered directly by the user (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DURATION        | VARCHAR2 (15)  |      | Indicates the duration of a temporary table:<br>SYS\$SESSION - Rows are preserved for the duration of the session<br>SYS\$TRANSACTION - Rows are deleted after COMMIT<br>Null - Permanent table                                                                                                                                                                                                                                                                                                                                |
| SKIP_CORRUPT    | VARCHAR2 (8)   |      | Indicates whether Oracle Database ignores blocks marked corrupt during table and index scans (ENABLED) or raises an error (DISABLED). To enable this feature, run the DBMS_REPAIR.skip_corrupt_blocks procedure.                                                                                                                                                                                                                                                                                                               |
| MONITORING      | VARCHAR2 (3)   |      | Indicates whether the table has the MONITORING attribute set (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CLUSTER_OWNER   | VARCHAR2 (128) |      | Owner of the cluster, if any, to which the table belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DEPENDENCIES    | VARCHAR2 (8)   |      | Indicates whether row-level dependency tracking is enabled (ENABLED) or disabled (DISABLED)                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| COMPRESSION     | VARCHAR2 (8)   |      | Indicates whether table compression is enabled (ENABLED) or not (DISABLED); NULL for partitioned tables                                                                                                                                                                                                                                                                                                                                                                                                                        |
| COMPRESS_FOR    | VARCHAR2 (30)  |      | Default compression for what kind of operations: <ul style="list-style-type: none"> <li>• BASIC</li> <li>• ADVANCED</li> <li>• QUERY LOW</li> <li>• QUERY HIGH</li> <li>• ARCHIVE LOW</li> <li>• ARCHIVE HIGH</li> <li>• NULL</li> </ul> The QUERY LOW, QUERY HIGH, ARCHIVE LOW, and ARCHIVE HIGH values are associated with Hybrid Columnar Compression, a feature of the Enterprise Edition of Oracle Database that is dependent on the underlying storage system. See <i>Oracle Database Concepts</i> for more information. |
| DROPPED         | VARCHAR2 (3)   |      | Indicates whether the table has been dropped and is in the recycle bin (YES) or not (NO); NULL for partitioned tables<br>This view does not return the names of tables that have been dropped.                                                                                                                                                                                                                                                                                                                                 |
| SEGMENT_CREATED | VARCHAR2 (3)   |      | Indicates whether the table segment has been created (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| INMEMORY        | VARCHAR2 (8)   |      | Indicates whether the In-Memory Column Store (IM column store) is enabled (ENABLED) or disabled (DISABLED) for this table                                                                                                                                                                                                                                                                                                                                                                                                      |

| Column               | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|---------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INMEMORY_PRIORITY    | VARCHAR2 (8)  |      | <p>Indicates the priority at which this table is populated into the In-Memory Column Store (IM column store). Possible values:</p> <ul style="list-style-type: none"> <li>• LOW</li> <li>• MEDIUM</li> <li>• HIGH</li> <li>• CRITICAL</li> <li>• NONE</li> <li>• NULL</li> </ul> <p>This column has a value based on where the segments lie for a table. For example, if the table is partitioned and is enabled for the IM column store, the value is NULL for ALL_TABLES but non-NULL for ALL_TAB_PARTITIONS.</p> |
| INMEMORY_DISTRIBUTE  | VARCHAR2 (15) |      | <p>Indicates how the table will be distributed in the IM column stores in an Oracle Real Application Clusters (Oracle RAC) environment:</p> <ul style="list-style-type: none"> <li>• AUTO</li> <li>• BY ROWID RANGE</li> <li>• BY PARTITION</li> <li>• BY SUBPARTITION</li> </ul>                                                                                                                                                                                                                                   |
| INMEMORY_COMPRESSION | VARCHAR2 (17) |      | <p>Compression level for the in-memory store:</p> <ul style="list-style-type: none"> <li>• NO MEMCOMPRESS</li> <li>• FOR DML</li> <li>• FOR QUERY [ LOW   HIGH ]</li> <li>• FOR CAPACITY [ LOW   HIGH ]</li> <li>• AUTO</li> <li>• NULL</li> </ul> <p>This column has a value based on where the segments lie for a table. For example, if the table is partitioned and is enabled for the IM column store, the value is NULL for ALL_TABLES but non-NULL for ALL_TAB_PARTITIONS.</p>                               |
| INMEMORY_DUPLICATE   | VARCHAR2 (13) |      | <p>Indicates the duplicate setting for the In-Memory Column Store (IM column store) in an Oracle RAC environment:</p> <ul style="list-style-type: none"> <li>• NO DUPLICATE</li> <li>• DUPLICATE</li> <li>• DUPLICATE ALL</li> </ul>                                                                                                                                                                                                                                                                                |
| EXTERNAL             | VARCHAR2 (3)  |      | <p>Indicates whether the table is an external table (YES) or not (NO)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| HYBRID               | VARCHAR2 (3)  |      | <p>Indicates whether the table is a hybrid partitioned table (YES) or not (NO). A hybrid partitioned table can contain a mixture of partitions stored in segments and partitions stored externally.</p>                                                                                                                                                                                                                                                                                                             |

| Column                  | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CELLMEMORY <sup>1</sup> | VARCHAR2 (24)   |      | <p>The value for columnar compression in the storage cell flash cache. Possible values:</p> <ul style="list-style-type: none"> <li>ENABLED: Oracle Exadata Storage will decide automatically whether to cache in columnar form</li> <li>DISABLED: Oracle Exadata Storage is prevented from caching in columnar form</li> <li>NO CACHECOMPRESS: Oracle Exadata Storage will cache in HCC format (no recompression)</li> <li>FOR QUERY: Oracle Exadata Storage will recompress and cache in INMEMORY query high format</li> <li>FOR CAPACITY: Oracle Exadata Storage will recompress and cache in INMEMORY capacity low format</li> </ul>                                                                                                                                                                     |
| INMEMORY_SERVICE        | VARCHAR2 (12)   |      | <p>Indicates how the IM column store is populated on various instances. The possible values are:</p> <ul style="list-style-type: none"> <li>DEFAULT: Data is populated on all instances specified with the <code>PARALLEL_INSTANCE_GROUP</code> initialization parameter. If that parameter is not set, then the data is populated on all instances. This is the default.</li> <li>NONE: Data is not populated on any instance.</li> <li>ALL: Data is populated on all instances, regardless of the value of the <code>PARALLEL_INSTANCE_GROUP</code> initialization parameter.</li> <li>USER_DEFINED: Data is populated only on the instances on which the user-specified service is active. The service name corresponding to this is stored in the <code>INMEMORY_SERVICE_NAME</code> column.</li> </ul> |
| INMEMORY_SERVICE_NAME   | VARCHAR2 (1000) |      | <p>Indicates the service name for the service on which the IM column store should be populated. This column has a value only when the corresponding <code>INMEMORY_SERVICE</code> is <code>USER_DEFINED</code>. In all other cases, this column is null.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MEMOPTIMIZE_READ        | VARCHAR2 (8)    |      | <p>Indicates whether the table is enabled for Fast Key Based Access (<code>ENABLED</code>) or not (<code>DISABLED</code>)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 3.13 ALL\_ANALYTIC\_VIEW\_AGGR\_DIMS

ALL\_ANALYTIC\_VIEW\_AGGR\_DIMS describes the aggregation function dimensions of the analytic views accessible to the current user.

### Related Views

- DBA\_ANALYTIC\_VIEW\_AGGR\_DIMS describes the aggregation function dimensions of all analytic views in the database.
- USER\_ANALYTIC\_VIEW\_AGGR\_DIMS describes the aggregation function dimensions of the analytic views owned by the current user. This view does not display the OWNER column.

| Column             | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                         |

## 3.15 ALL\_ANALYTIC\_VIEW\_AGGR\_FNS\_AE

ALL\_ANALYTIC\_VIEW\_AGGR\_FNS\_AE describes the aggregation functions of the analytic views (across all editions) accessible to the current user.

### Related Views

- DBA\_ANALYTIC\_VIEW\_AGGR\_FNS\_AE describes the aggregation functions of all analytic views (across all editions) in the database.
- USER\_ANALYTIC\_VIEW\_AGGR\_FNS\_AE describes the aggregation functions of the analytic views (across all editions) owned by the current user. This view does not display the OWNER or ORIGIN\_CON\_ID columns.

## 3.18 ALL\_ANALYTIC\_VIEW\_ATTR\_CLASS

ALL\_ANALYTIC\_VIEW\_ATTR\_CLASS describes the attribute classifications of the analytic views accessible to the current user.

### Related Views

- DBA\_ANALYTIC\_VIEW\_ATTR\_CLASS describes the attribute classifications of all analytic views in the database.
- USER\_ANALYTIC\_VIEW\_ATTR\_CLASS describes the attribute classifications of the analytic views owned by the current user. This view does not display the OWNER column.

| Column             | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                         |

## 3.21 ALL\_ANALYTIC\_VIEW\_BAS\_MEAS

ALL\_ANALYTIC\_VIEW\_BAS\_MEAS is identical to ALL\_ANALYTIC\_VIEW\_BASE\_MEAS.

**See Also:**

["ALL\\_ANALYTIC\\_VIEW\\_BASE\\_MEAS"](#)

## 3.22 ALL\_ANALYTIC\_VIEW\_BAS\_MEAS\_AE

ALL\_ANALYTIC\_VIEW\_BAS\_MEAS\_AE describes the base measures in the analytic views (across all editions) accessible to the current user.

**Related Views**

- [DBA\\_ANALYTIC\\_VIEW\\_BAS\\_MEAS\\_AE](#) describes the base measures in all analytic views (across all editions) in the database.
- [USER\\_ANALYTIC\\_VIEW\\_BAS\\_MEAS\\_AE](#) describes the base measures in the analytic views (across all editions) owned by the current user. This view does not display the `OWNER` column.

| Column             | Datatype       | NULL     | Description                                                                             |

- DBA\_ANALYTIC\_VIEW\_CLC\_MEAS\_AE describes the calculated measures in all analytic views (across all editions) in the database.
- USER\_ANALYTIC\_VIEW\_CLC\_MEAS\_AE describes the calculated measures in the analytic views (across all editions) owned by the current user. This view does not display the OWNER column.

| Column             | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER              | VARCHAR2 (128) | NOT NULL | Owner of the analytic view                                                                                                                                                                                                                                                                                                                                                             |
| ANALYTIC_VIEW_NAME | VARCHAR2 (128) | NOT NULL | Name of the analytic view                                                                                                                                                                                                                                                                                                                                                              |
| MEASURE_NAME       | VARCHAR2 (128) |          | Name of the analytic view calculated measure                                                                                                                                                                                                                                                                                                                                           |
| MEAS_EXPRESSION    | CLOB           |          | Text of the expression for the measure                                                                                                                                                                                                                                                                                                                                                 |
| ORDER_NUM          | NUMBER         | NOT NULL | Order number of the calculated measure in the list of the measures in the analytic view                                                                                                                                                                                                                                                                                                |
| ORIGIN_CON_ID      | NUMBER         |          | The ID of the container where the data originates.<br>Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows in non-CDBs. This value is not used for CDBs.</li><li>• <i>n</i>: This value is used for rows containing data that originate in the container with container ID <i>n</i> (<i>n</i> = 1 if the row originates in root).</li></ul> |
| EDITION_NAME       | VARCHAR2 (128) |          | Name of the application edition where the analytic view is defined                                                                                                                                                                                                                                                                                                                     |

## 3.29 ALL\_ANALYTIC\_VIEW\_COLUMNS

ALL\_ANALYTIC\_VIEW\_COLUMNS describes the columns of the analytic views accessible to the current user.

### Related Views

- DBA\_ANALYTIC\_VIEW\_COLUMNS describes the columns of all analytic views in the database.
- USER\_ANALYTIC\_VIEW\_COLUMNS describes the columns of the analytic views owned by the current user. This view does not display the OWNER column.

| Column               | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER                | VARCHAR2 (128) | NOT NULL | Owner of the analytic view                                                                                                                                                                                                                                                                                                                                                                                                                             |

| DIMENSION_NAME       | VARCHAR2 (128) |          | Alias of the analytic view dimension in the analytic view; for a measure the value is MEASURES                                                                                                                                                                                                                                                                                                                                                         |
| HIER_NAME            | VARCHAR2 (128) |          | Alias of the analytic view hierarchy within DIMENSION_NAME in the analytic view; for a measure the value is MEASURES                                                                                                                                                                                                                                                                                                                                   |
| COLUMN_NAME          | VARCHAR2 (128) | NOT NULL | Name of the column                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ROLE                 | VARCHAR2 (4)   | NOT NULL | The role the attribute plays in the analytic view: <ul style="list-style-type: none"> <li>• KEY</li> <li>• AKEY</li> <li>• HIER</li> <li>• PROP</li> <li>• MEAS</li> </ul>                                                                                                                                                                                                                                                                             |
| DATA_TYPE            | VARCHAR2 (106) | NOT NULL | Datatype of the column                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DATA_LENGTH          | NUMBER         | NOT NULL | Length of the column (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DATA_PRECISION       | NUMBER         |          | Decimal precision for the NUMBER datatype; binary precision for the FLOAT datatype, NULL for all other datatypes                                                                                                                                                                                                                                                                                                                                       |
| DATA_SCALE           | NUMBER         |          | Number of digits to the right of the decimal point in a number                                                                                                                                                                                                                                                                                                                                                                                         |
| NULLABLE             | CHAR (1)       | NOT NULL | Indicates whether a column allows NULL values; the value is N if there is a NOT NULL constraint on the column or if the column is part of a PRIMARY KEY                                                                                                                                                                                                                                                                                                |
| CHARACTER_SET_NAME   | VARCHAR2 (44)  |          | Name of the character set: <ul style="list-style-type: none"> <li>• CHAR_CS</li> <li>• NCHAR_CS</li> </ul>                                                                                                                                                                                                                                                                                                                                             |
| CHAR_COL_DECL_LENGTH | NUMBER         |          | Declaration length of the character type column                                                                                                                                                                                                                                                                                                                                                                                                        |
| CHAR_USED            | VARCHAR2 (1)   |          | Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C), or whether the datatype is not any of the following (NULL): <ul style="list-style-type: none"> <li>• CHAR</li> <li>• VARCHAR2</li> <li>• NCHAR</li> <li>• NVARCHAR2</li> </ul>                                                                                                                                                                                  |
| ORDER_NUM            | NUMBER         | NOT NULL | Order of the column, with the hierarchy columns first followed by measure columns. The columns for a hierarchy are grouped together, listed in their order in the HIERARCHIES clause of the analytic view definition. Within a hierarchy, attributes are listed first in order of their definition in the ATTRIBUTES clause of the attribute dimension definition followed by hierarchical attributes in the DIMENSION BY clause of the analytic view. |

| Column        | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|----------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORIGIN_CON_ID | NUMBER   |      | <p>The ID of the container where the data originates. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows in non-CDBs. This value is not used for CDBs.</li> <li><i>n</i>: This value is used for rows containing data that originate in the container with container ID <i>n</i> (<i>n</i> = 1 if the row originates in root).</li> </ul> |

## 3.30 ALL\_ANALYTIC\_VIEW\_COLUMNS\_AE

ALL\_ANALYTIC\_VIEW\_COLUMNS\_AE describes the columns of the analytic views (across all editions) accessible to the current user.

#### Related Views

- DBA\_ANALYTIC\_VIEW\_COLUMNS\_AE describes the columns of all analytic views (across all editions) in the database.
- USER\_ANALYTIC\_VIEW\_COLUMNS\_AE describes the columns of the analytic views (across all editions) owned by the current user. This view does not display the OWNER column.

| Column             | Datatype       | NULL     | Description                                                                                                                                                                       |
|--------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER              | VARCHAR2 (128) | NOT NULL | Owner of the analytic view                                                                                                                                                        |
| ANALYTIC_VIEW_NAME | VARCHAR2 (128) | NOT NULL | Name of the analytic view                                                                                                                                                         |
| DIMENSION_NAME     | VARCHAR2 (128) |          | Alias of the analytic view dimension in the analytic view; for a measure the value is MEASURES                                                                                    |
| HIER_NAME          | VARCHAR2 (128) |          | Alias of the analytic view hierarchy within DIMENSION_NAME in the analytic view; for a measure the value is MEASURES                                                              |
| COLUMN_NAME        | VARCHAR2 (128) | NOT NULL | Name of the column                                                                                                                                                                |
| ROLE               | VARCHAR2 (4)   | NOT NULL | <p>The role the attribute plays in the analytic view:</p> <ul style="list-style-type: none"> <li>• KEY</li> <li>• AKEY</li> <li>• HIER</li> <li>• PROP</li> <li>• MEAS</li> </ul> |
| DATA_TYPE          | VARCHAR2 (106) | NOT NULL | Datatype of the column                                                                                                                                                            |
| DATA_LENGTH        | NUMBER         | NOT NULL | Length of the column (in bytes)                                                                                                                                                   |
| DATA_PRECISION     | NUMBER         |          | Decimal precision for the NUMBER datatype; binary precision for the FLOAT datatype, NULL for all other datatypes                                                                  |

| Column               | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DATA_SCALE           | NUMBER        |          | Number of digits to the right of the decimal point in a number                                                                                                                                                                                                                                                                                                                                                                                         |

## 3.36 ALL\_ANALYTIC\_VIEW\_DIM\_CLS\_AE

ALL\_ANALYTIC\_VIEW\_DIM\_CLS\_AE describes the classifications of the attribute dimensions in the analytic views (across all editions) accessible to the current user.

#### Related Views

- DBA\_ANALYTIC\_VIEW\_DIM\_CLS\_AE describes the classifications of the attribute dimensions in all analytic views (across all editions) in the database.
- USER\_ANALYTIC\_VIEW\_DIM\_CLS\_AE describes the classifications of the attribute dimensions in the analytic views (across all editions) owned by the current user. This view does not display the OWNER column.

| Column             | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                        |

## 3.47 ALL\_ANALYTIC\_VIEW\_HIERS\_AE

ALL\_ANALYTIC\_VIEW\_HIERS\_AE describes the hierarchies in the analytic views (across all editions) accessible to the current user.

### Related Views

- DBA\_ANALYTIC\_VIEW\_HIERS\_AE describes the hierarchies in all analytic views (across all editions) in the database.

- `USER_ANALYTIC_VIEW_HIERS_AE` describes the hierarchies in the analytic views (across all editions) owned by the current user. This view does not display the `OWNER` column.

## 3.48 ALL\_ANALYTIC\_VIEW\_KEYS

`ALL_ANALYTIC_VIEW_KEYS` describes the key columns of the attribute dimensions in the analytic views accessible to the current user.

The keys reference attributes of the attribute dimensions of the analytic view.

#### Related Views

- `DBA_ANALYTIC_VIEW_KEYS` describes the key columns of the attribute dimensions in all analytic views in the database.
- `USER_ANALYTIC_VIEW_KEYS` describes the key columns of the attribute dimensions in the analytic views owned by the current user. This view does not display the `OWNER` column.

| Column                          | Datatype                    | NULL     | Description               |

## 3.55 ALL\_ANALYTIC\_VIEW\_LVLGRPS

ALL\_ANALYTIC\_VIEW\_LVLGRPS describes the analytic view measure and level groups of the analytic views accessible to the current user.

### Related Views

- DBA\_ANALYTIC\_VIEW\_LVLGRPS describes the analytic view measure and level groups of all analytic views in the database.
- USER\_ANALYTIC\_VIEW\_LVLGRPS describes the analytic view measure and level groups of the analytic views owned by the current user. This view does not display the OWNER column.

| Column             | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                            |

## 3.61 ALL\_ANALYTIC\_VIEWS\_AE

ALL\_ANALYTIC\_VIEWS\_AE describes the analytic views (across all editions) accessible to the current user.

### Related Views

- DBA\_ANALYTIC\_VIEWS\_AE describes all analytic views (across all editions) in the database.
- USER\_ANALYTIC\_VIEWS\_AE describes the analytic views (across all editions) owned by the current user. This view does not display the OWNER column.

| Column                  | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                       |

## 3.63 ALL\_ANNOTATIONS

ALL\_ANNOTATIONS displays schema annotations accessible to the current user.

**Related Views**

- DBA\_ANNOTATIONS displays all schema annotations in the database.

- `USER_ANNOTATIONS` displays schema annotations owned by the current user. This view does not display the `ANNOTATION_OWNER` column.

| Column           | Datatype        | NULL     | Description      |
|------------------|-----------------|----------|------------------|
| ANNOTATION_OWNER | VARCHAR2 (128)  | NOT NULL | Annotation owner |
| ANNOTATION_NAME  | VARCHAR2 (1024) | NOT NULL | Annotation name  |

**Note:**

This view is available starting with Oracle Database 23ai.

## 3.64 ALL\_ANNOTATIONS\_USAGE

`ALL_ANNOTATIONS_USAGE` provides usage information about schema annotations accessible to the current user.

### Related Views

- `DBA_ANNOTATIONS_USAGE` provides usage information about all schema annotations in the database.
- `USER_ANNOTATIONS_USAGE` provides usage information about schema annotations owned by the current user. This view does not display the `ANNOTATION_OWNER` column.

| Column           | Datatype       | NULL | Description                                                                                                                                                                                  |
|------------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_NAME      | VARCHAR2 (128) |      | Object name                                                                                                                                                                                  |
| OBJECT_TYPE      | VARCHAR2 (9)   |      | Object type                                                                                                                                                                                  |
| COLUMN_NAME      | VARCHAR2 (128) |      | If the annotation is specified for a table column, view column, or domain column, the name of the column; otherwise NULL                                                                     |
| DOMAIN_NAME      | VARCHAR2 (128) |      | If the annotation is carried over from a domain or a domain column, the name of the domain; otherwise NULL<br>Note that domains carry over their annotations to objects that reference them. |
| DOMAIN_OWNER     | VARCHAR2 (128) |      | If the annotation is carried over from a domain or domain column, the owner of the domain; otherwise NULL<br>Note that domains carry over their annotations to objects that reference them.  |
| ANNOTATION_OWNER | VARCHAR2 (128) |      | Annotation owner                                                                                                                                                                             |

| Column           | Datatype        | NULL | Description                                                                                                                                                     |
|------------------|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ANNOTATION_NAME  | VARCHAR2 (1024) |      | Annotation name                                                                                                                                                 |
| ANNOTATION_VALUE | VARCHAR2 (4000) |      | Optional annotation value<br>A NULL value is possible when the annotation does not require a value, that is, when the annotation is defined solely by its name. |

## 3.65 ALL\_APPLY

ALL\_APPLY displays information about the apply processes that dequeue messages from queues accessible to the current user.

### Related View

DBA\_APPLY displays information about all apply processes in the database.

| Column              | Datatype       | NULL     | Description                                                                                          |
|---------------------|----------------|----------|------------------------------------------------------------------------------------------------------|
| APPLY_NAME          | VARCHAR2 (128) | NOT NULL | Name of the apply process                                                                            |
| QUEUE_NAME          | VARCHAR2 (128) | NOT NULL | Name of the queue from which the apply process dequeues                                              |
| QUEUE_OWNER         | VARCHAR2 (128) | NOT NULL | Owner of the queue from which the apply process dequeues                                             |
| APPLY_CAPTURED      | VARCHAR2 (3)   |          | Indicates whether the apply process applies captured messages (YES) or user-enqueued messages (NO)   |
| RULE_SET_NAME       | VARCHAR2 (128) |          | Name of the positive rule set used by the apply process for filtering                                |
| RULE_SET_OWNER      | VARCHAR2 (128) |          | Owner of the positive rule set used by the apply process for filtering                               |
| APPLY_USER          | VARCHAR2 (128) |          | User who is applying messages                                                                        |
| APPLY_DATABASE_LINK | VARCHAR2 (128) |          | Database link to which changes are applied. If NULL, then changes are applied to the local database. |
| APPLY_TAG           | RAW (2000)     |          | Tag associated with redo log records that are generated when changes are made by the apply process   |

| Column                     | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|-----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DDL_HANDLER                | VARCHAR2 (98)   |      | Name of the user-specified data definition language (DDL) handler, which handles DDL logical change records (LCRs)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PRECOMMIT_HANDLER          | VARCHAR2 (98)   |      | Name of the user-specified pre-commit handler                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MESSAGE_HANDLER            | VARCHAR2 (98)   |      | Name of the user-specified procedure that handles dequeued messages other than logical change records (LCRs)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STATUS                     | VARCHAR2 (8)    |      | Status of the apply process: <ul style="list-style-type: none"> <li>• DISABLED</li> <li>• ENABLED</li> <li>• ABORTED</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                      |
| MAX_APPLIED_MESSAGE_NUMBER | NUMBER          |      | System change number (SCN) corresponding to the apply process high watermark for the last time the apply process was stopped using the <code>DBMS_APPLY_ADM.STOP_APPLY</code> procedure with the <code>force</code> parameter set to <code>false</code> . The apply process high watermark is the SCN beyond which no messages have been applied.                                                                                                                                                                                    |
| NEGATIVE_RULE_SET_NAME     | VARCHAR2 (128)  |      | Name of the negative rule set used by the apply process for filtering                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| NEGATIVE_RULE_SET_OWNER    | VARCHAR2 (128)  |      | Owner of the negative rule set used by the apply process for filtering                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| STATUS_CHANGE_TIME         | DATE            |      | Time that the <code>STATUS</code> of the apply process was changed                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| OBJECT_OWNER   | VARCHAR2 (128) | NOT NULL | Owner of the object on which the DML handler is specified                                                                                                                                                              |
| OBJECT_NAME    | VARCHAR2 (128) | NOT NULL | Name of the object on which the DML handler is specified                                                                                                                                                               |
| OPERATION_NAME | VARCHAR2 (13)  |          | Name of the DML operation for which the DML handler is used: <ul style="list-style-type: none"><li>• DEFAULT</li><li>• INSERT</li><li>• UPDATE</li><li>• DELETE</li><li>• LOB_UPDATE</li><li>• ASSEMBLE_LOBS</li></ul> |
| USER_PROCEDURE | VARCHAR2 (98)  |          | Name of the user-specified DML handler, which handles row logical change records that contain the DML operation in the OPERATION_NAME column on the object                                                             |

| Column              | Datatype       | NULL | Description                                                                                                                                                                                                                                                                            |
|---------------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR_HANDLER       | VARCHAR2 (1)   |      | Indicates whether the DML handler handles only the relevant row logical change records that result in apply errors (Y) or all relevant row logical change records (N)                                                                                                                  |
| APPLY_DATABASE_LINK | VARCHAR2 (128) |      | Database link to which changes are applied. If null, then changes are applied to the local database.                                                                                                                                                                                   |
| APPLY_NAME          | VARCHAR2 (128) |      | Name of the apply process for the given object                                                                                                                                                                                                                                         |
| ASSEMBLE_LOBS       | VARCHAR2 (1)   |      | Indicates whether LOB assembly is used for LOB columns in logical change records (LCRs) processed by the handler (Y) or not (N)<br><br>LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. |
| SET_BY              | VARCHAR2 (10)  |      | Entity that set up the handler. Possible values include: <ul style="list-style-type: none"> <li>GOLDENGATE</li> <li>USER</li> </ul>                                                                                                                                                    |

## 3.70 ALL\_APPLY\_ENQUEUE

ALL\_APPLY\_ENQUEUE displays information about the apply enqueue actions for the rules where the destination queue exists and is accessible to the current user.

#### Related View

DBA\_APPLY\_ENQUEUE displays information about the apply enqueue actions for all rules in the database.

| Column                 | Datatype        | NULL     | Description                                                         |
|------------------------|-----------------|----------|---------------------------------------------------------------------|
| RULE_OWNER             | VARCHAR2 (128)  | NOT NULL | Owner of the rule                                                   |
| RULE_NAME              | VARCHAR2 (128)  | NOT NULL | Name of the rule                                                    |
| DESTINATION_QUEUE_NAME | VARCHAR2 (4000) |          | Name of the queue where events satisfying the rule will be enqueued |

## 3.71 ALL\_APPLY\_ERROR

ALL\_APPLY\_ERROR displays information about the error transactions generated by the apply processes that dequeue messages from queues accessible to the current user.

### Related Views

- DBA\_APPLY\_ERROR displays information about the error transactions generated by all apply processes in the database.
- USER\_APPLY\_ERROR displays information about the error transactions generated by apply processes visible to the current user. This view does not display the SOURCE\_ROOT\_NAME column.

| Column                 | Datatype        | NULL | Description                                                                           |
|------------------------|-----------------|------|---------------------------------------------------------------------------------------|
| APPLY_NAME             | VARCHAR2 (128)  |      | Name of the apply process at the local database which processed the transaction       |
| QUEUE_NAME             | VARCHAR2 (128)  |      | Name of the queue at the local database from which the transaction was dequeued       |
| QUEUE_OWNER            | VARCHAR2 (128)  |      | Owner of the queue at the local database from which the transaction was dequeued      |
| LOCAL_TRANSACTION_ID   | VARCHAR2 (22)   |      | Local transaction ID for the error transaction                                        |
| SOURCE_DATABASE        | VARCHAR2 (128)  |      | Database where the transaction originated                                             |
| SOURCE_TRANSACTION_ID  | VARCHAR2 (128)  |      | Original transaction ID at the source database                                        |
| SOURCE_COMMIT_SCN      | NUMBER          |      | Original commit system change number (SCN) for the transaction at the source database |
| MESSAGE_NUMBER         | NUMBER          |      | Identifier for the message in the transaction that raised an error                    |
| ERROR_NUMBER           | NUMBER          |      | Error number of the error raised by the transaction                                   |
| ERROR_MESSAGE          | VARCHAR2 (4000) |      | Error message of the error raised by the transaction                                  |
| RECIPIENT_ID           | NUMBER          |      | User ID of the original user that applied the transaction                             |
| RECIPIENT_NAME         | VARCHAR2 (128)  |      | Name of the original user that applied the transaction                                |
| MESSAGE_COUNT          | NUMBER          |      | Total number of messages inside the error transaction                                 |
| ERROR_CREATION_TIME    | DATE            |      | Time that the error was created                                                       |
| SOURCE_COMMIT_POSITION | RAW (64)        |      | Original commit position for the transaction                                          |

| Column           | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR_TYPE       | VARCHAR2 (11)  |      | <p>NULL if the apply process can access all of the LCRs in the error transaction.</p> <p>EAGER ERROR if the apply process cannot access all of the LCRs in the error transaction. This error type typically means that the apply process was applying LCRs in a large transaction. When the ERROR_TYPE is EAGER ERROR, manage the error transaction using the instructions in <i>Oracle Database XStream Guide</i>.</p> <p>RECORD LCR indicates that a single LCR has been recorded as requested by user-specified error handling configuration</p> <p>RECORD TXN NO LCRS indicates that the identified transaction encountered an error and only the transaction ID is recorded as requested by user-specified error handling configuration</p> <p>RECORD TXN WITH LCRS indicates that the identified transaction encountered an error. The entire transaction is recorded as requested by user-specified error handling configuration.</p> <p>UNHANDLED ERRORS NO LCR indicates that the identified transaction encountered an error and there was no error handling specified for this handler. No LCRs are recorded for this transaction.</p> <p>DISCARDED is used to mark recorded and discarded LCRs.</p> |
| SOURCE_ROOT_NAME | VARCHAR2 (128) |      | The global name of the source root database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ERROR_POSITION   | RAW (64)       |      | LCR position at which the error occurred                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 3.72 ALL\_APPLY\_ERROR\_MESSAGES

ALL\_APPLY\_ERROR\_MESSAGES displays information about the individual messages in an error transaction generated by the apply processes that dequeue messages from queues accessible to the current user.

For XStream inbound servers, each message in an error transaction is a logical change record (LCR).

**Note:**

- Messages that were spilled from memory to hard disk do not appear in this view.
- This view does not contain information related to XStream outbound servers.

**Related View**

DBA\_APPLY\_ERROR\_MESSAGES displays information about the individual messages in all of the error transactions generated by all apply processes in the database.

| Column                     | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 3.75 ALL\_APPLY\_INSTANTIATED\_GLOBAL

ALL\_APPLY\_INSTANTIATED\_GLOBAL displays information for the current user about databases for which an instantiation SCN has been set.

**Related View**

DBA\_APPLY\_INSTANTIATED\_GLOBAL displays information about databases for which an instantiation SCN has been set.

| Column            | Datatype       | NULL     | Description                                                                                                |
|-------------------|----------------|----------|------------------------------------------------------------------------------------------------------------|
| SOURCE_DATABASE   | VARCHAR2 (128) | NOT NULL | Name of the database that was instantiated                                                                 |
| INSTANTIATION_SCN | NUMBER         |          | Instantiation SCN for the database. Only changes committed after this SCN are applied by an apply process. |

| Column              | Datatype       | NULL | Description                                                                                          |
|---------------------|----------------|------|------------------------------------------------------------------------------------------------------|
| APPLY_DATABASE_LINK | VARCHAR2 (128) |      | Database link to which changes are applied. If null, then changes are applied to the local database. |
| SOURCE_ROOT_NAME    | VARCHAR2 (128) |      | The global name of the source root database                                                          |

## 3.76 ALL\_APPLY\_INSTANTIATED\_OBJECTS

ALL\_APPLY\_INSTANTIATED\_OBJECTS displays information about objects accessible to the current user for which an instantiation SCN has been set.

### Related View

DBA\_APPLY\_INSTANTIATED\_OBJECTS displays information about objects for which an instantiation SCN has been set.

| Column              | Datatype       | NULL     | Description                                                                                                                                                                     |
|---------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SOURCE_DATABASE     | VARCHAR2 (128) | NOT NULL | Name of the database where the object originated                                                                                                                                |
| SOURCE_OBJECT_OWNER | VARCHAR2 (128) | NOT NULL | Owner of the object at the source database                                                                                                                                      |
| SOURCE_OBJECT_NAME  | VARCHAR2 (128) | NOT NULL | Name of the object at the source database                                                                                                                                       |
| SOURCE_OBJECT_TYPE  | VARCHAR2 (11)  |          | Type of the object at the source database                                                                                                                                       |
| INSTANTIATION_SCN   | NUMBER         |          | Instantiation SCN for the object. Only changes committed after this SCN are applied by an apply process.                                                                        |
| IGNORE_SCN          | NUMBER         |          | SCN below which the instantiation SCN cannot be set. This value corresponds to the SCN value at the source database at the time when the object was prepared for instantiation. |
| APPLY_DATABASE_LINK | VARCHAR2 (128) |          | Database link to which changes are applied. If null, then changes are applied to the local database.                                                                            |
| SOURCE_ROOT_NAME    | VARCHAR2 (128) |          | The global name of the source root database                                                                                                                                     |

## 3.77 ALL\_APPLY\_INSTANTIATED\_SCHEMAS

ALL\_APPLY\_INSTANTIATED\_SCHEMAS displays information about schemas accessible to the current user for which an instantiation SCN has been set.

### Related View

DBA\_APPLY\_INSTANTIATED\_SCHEMAS displays information about schemas for which an instantiation SCN has been set.

| Column              | Datatype       | NULL     | Description                                                                                              |
|---------------------|----------------|----------|----------------------------------------------------------------------------------------------------------|
| SOURCE_DATABASE     | VARCHAR2 (128) | NOT NULL | Name of the database where the schema originated                                                         |
| SOURCE_SCHEMA       | VARCHAR2 (128) |          | Name of the schema at the source database                                                                |
| INSTANTIATION_SCN   | NUMBER         |          | Instantiation SCN for the schema. Only changes committed after this SCN are applied by an apply process. |
| APPLY_DATABASE_LINK | VARCHAR2 (128) |          | Database link to which changes are applied. If null, then changes are applied to the local database.     |
| SOURCE_ROOT_NAME    | VARCHAR2 (128) |          | The global name of the source root database                                                              |

## 3.78 ALL\_APPLY\_KEY\_COLUMNS

ALL\_APPLY\_KEY\_COLUMNS displays information about the substitute key columns for the tables accessible to the current user. Substitute key columns are set using the DBMS\_APPLY\_ADM.SET\_KEY\_COLUMNS procedure.

### Related View

DBA\_APPLY\_KEY\_COLUMNS displays information about the substitute key columns for all tables in the database.

| Column              | Datatype       | NULL     | Description                                                                                          |
|---------------------|----------------|----------|------------------------------------------------------------------------------------------------------|
| OBJECT_OWNER        | VARCHAR2 (128) | NOT NULL | Owner of the object on which substitute key columns are set                                          |
| OBJECT_NAME         | VARCHAR2 (128) | NOT NULL | Name of the object on which substitute key columns are set                                           |
| COLUMN_NAME         | VARCHAR2 (128) | NOT NULL | Column name of a column specified as a substitute key column                                         |
| APPLY_DATABASE_LINK | VARCHAR2 (128) |          | Database link to which changes are applied. If null, then changes are applied to the local database. |

## 3.79 ALL\_APPLY\_PARAMETERS

`ALL_APPLY_PARAMETERS` displays information about the parameters for the apply processes that dequeue events from queues accessible to the current user.

**Related View**

`DBA_APPLY_PARAMETERS` displays information about the parameters for all apply processes in the database.

| Column      | Datatype        | NULL     | Description                                                                                                                                                                                                                                                    |
|-------------|-----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPLY_NAME  | VARCHAR2 (128)  | NOT NULL | Name of the apply process                                                                                                                                                                                                                                      |
| PARAMETER   | VARCHAR2 (128)  | NOT NULL | Name of the parameter                                                                                                                                                                                                                                          |
| VALUE       | VARCHAR2 (4000) |          | Parameter value                                                                                                                                                                                                                                                |
| SET_BY_USER | VARCHAR2 (3)    |          | Indicates whether the parameter value was set by the user (YES) or was not set by the user (NO). If NO for a parameter, then the parameter is set to its default value. If YES for a parameter, then the parameter may or may not be set to its default value. |

## 3.80 ALL\_APPLY\_PROGRESS

`ALL_APPLY_PROGRESS` displays information about the progress made by the apply processes that dequeue events from queues accessible to the current user. This view only contains information about captured events. It does not contain information about user-enqueued events.

**Related View**

`DBA_APPLY_PROGRESS` displays information about the progress made by all apply processes in the database.

| Column          | Datatype       | NULL     | Description                                                                             |
|-----------------|----------------|----------|-----------------------------------------------------------------------------------------|
| APPLY_NAME      | VARCHAR2 (128) | NOT NULL | Name of the apply process                                                               |
| SOURCE_DATABASE | VARCHAR2 (128) | NOT NULL | Global name of the source database of the changes that are applied by the apply process |

| Column                      | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPLIED_MESSAGE_NUMBER      | NUMBER         | NOT NULL | Message number up to which all transactions have definitely been applied. This value is the low watermark for the apply process. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number may also have been applied. |
| OLDEST_MESSAGE_NUMBER       | NUMBER         | NOT NULL | Earliest message number of the transactions currently being dequeued and applied                                                                                                                                                                                                                                                          |
| APPLY_TIME                  | DATE           |          | Time at which the message with the message number displayed in the APPLIED_MESSAGE_NUMBER column was applied                                                                                                                                                                                                                              |
| APPLIED_MESSAGE_CREATE_TIME | DATE           |          | Time at which the message with the message number displayed in the APPLIED_MESSAGE_NUMBER column was created at its source database                                                                                                                                                                                                       |
| OLDEST_TRANSACTION_ID       | VARCHAR2 (128) |          | Oldest transaction ID of interest. (useful for detecting long-running or large transactions)                                                                                                                                                                                                                                              |
| SPILL_MESSAGE_NUMBER        | NUMBER         |          | Spill low watermark. Any message with a lower SCN has either been applied or spilled to disk (it will be dequeued from the Streams queue and capture will not need to resend any logical change records (LCRs) with a lower SCN). Spilled messages may not have been applied yet.                                                         |
| SOURCE_ROOT_NAME            | VARCHAR2 (128) |          | The global name of the source root database                                                                                                                                                                                                                                                                                               |

## 3.81 ALL\_APPLY\_REPERROR\_HANDLERS

ALL\_APPLY\_REPERROR\_HANDLERS provides details about apply reperror handlers on objects visible to the user.

### Related View

DBA\_APPLY\_REPERROR\_HANDLERS provides details about apply reperror handlers.

| Column              | Datatype       | NULL     | Description                                |
|---------------------|----------------|----------|--------------------------------------------|
| APPLY_NAME          | VARCHAR2 (128) | NOT NULL | Name of the apply process                  |
| OBJECT_OWNER        | VARCHAR2 (128) | NOT NULL | Owner of the object                        |
| OBJECT_NAME         | VARCHAR2 (128) | NOT NULL | Name of the object                         |
| SOURCE_OBJECT_OWNER | VARCHAR2 (128) | NOT NULL | Source database owner of the source object |
| SOURCE_OBJECT_NAME  | VARCHAR2 (128) | NOT NULL | Source database name of the object         |
| ERROR_NUMBER        | NUMBER         | NOT NULL | Error number for the handler               |

| Column      | Datatype      | NULL | Description                                                                                                                                                                               |
|-------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| METHOD      | VARCHAR2 (18) |      | Error handling method: <ul style="list-style-type: none"><li>• ABEND</li><li>• RECORD</li><li>• IGNORE</li><li>• RETRY</li><li>• RETRY_TRANSACTION</li><li>• RECORD_TRANSACTION</li></ul> |
| MAX_RETRIES | NUMBER        |      | Maximum number of times to retry for the method RETRY and RETRY_TRANSACTION                                                                                                               |
| DELAY_CSECS | NUMBER        |      | Number of centiseconds to wait between retries for RETRY and RETRY_TRANSACTION                                                                                                            |
| SET_BY      | VARCHAR2 (10) |      | Entity that set up the handler: <ul style="list-style-type: none"><li>• USER</li><li>• GOLDENGATE</li></ul>                                                                               |

## 3.82 ALL\_APPLY\_TABLE\_COLUMNS

ALL\_APPLY\_TABLE\_COLUMNS displays, for the tables accessible to the current user, information about the nonkey table columns for which apply process conflict detection has been stopped for update and delete operations.

Conflict detection for nonkey columns can be stopped using the DBMS\_APPLY\_ADM.COMPARE\_OLD\_VALUES procedure.

### Related View

DBA\_APPLY\_TABLE\_COLUMNS displays, for all tables in the database, information about the nonkey table columns for which apply process conflict detection has been stopped for update and delete operations.

| Column                | Datatype        | NULL | Description                                                                           |
|-----------------------|-----------------|------|---------------------------------------------------------------------------------------|
| OBJECT_OWNER          | VARCHAR2 (128)  |      | Owner of the table                                                                    |
| OBJECT_NAME           | VARCHAR2 (128)  |      | Name of the table                                                                     |
| COLUMN_NAME           | VARCHAR2 (4000) |      | Name of the column                                                                    |
| COMPARE_OLD_ON_DELETE | VARCHAR2 (3)    |      | Indicates whether to Compare the old value of the column on deletes (YES) or not (NO) |
| COMPARE_OLD_ON_UPDATE | VARCHAR2 (3)    |      | Indicates whether to Compare the old value of the column on updates (YES) or not (NO) |
| APPLY_DATABASE_LINK   | VARCHAR2 (128)  |      | For remote tables, name of the database link pointing to the remote database          |

## 3.83 ALL\_ARGUMENTS

`ALL_ARGUMENTS` lists the arguments of the functions and procedures that are accessible to the current user.

 **Note:**

The following changes have been made to this view:

- Starting with Oracle Database 12c release 1 (12.1.0.2), this view omits procedures with no arguments. Prior to Oracle Database 12c release 1 (12.1.0.2), a procedure with no arguments was presented as a single row in this view.
- Starting with Oracle Database 18c, this view displays only one row for an argument that is a composite type. Prior to Oracle Database 18c, this view displayed multiple rows for composite types.

To obtain information about composite type arguments, use the value of the `TYPE_NAME` column in this view to query the `ALL_PLSQL_TYPES`, `ALL_PLSQL_TYPE_ATTRS`, and `ALL_PLSQL_COLL_TYPES` views, which fully describe composite types.

See *Oracle Database Upgrade Guide* for more information about these changes.

### Related Views

- `DBA_ARGUMENTS` lists the arguments of the functions and procedures that are available in the database.
- `USER_ARGUMENTS` lists the arguments of the functions and procedures that are owned by the current user. This view does not display the `OWNER` column.

| Column        | Datatype       | NULL     | Description                                                                                           |
|---------------|----------------|----------|-------------------------------------------------------------------------------------------------------|
| OWNER         | VARCHAR2 (128) | NOT NULL | Owner of the object                                                                                   |
| OBJECT_NAME   | VARCHAR2 (128) |          | Name of the procedure or function                                                                     |
| PACKAGE_NAME  | VARCHAR2 (128) |          | Name of the package                                                                                   |
| OBJECT_ID     | NUMBER         | NOT NULL | Object number of the object                                                                           |
| OVERLOAD      | VARCHAR2 (40)  |          | Indicates the <i>n</i> th overloading ordered by its appearance in the source; otherwise, it is NULL. |
| SUBPROGRAM_ID | NUMBER         |          | Unique subprogram identifier                                                                          |

| Column             | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                    |
|--------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARGUMENT_NAME      | VARCHAR2 (128) |          | Name of the argument<br>A null argument name is used to denote a function return.                                                                                                                                                                                              |
| POSITION           | NUMBER         | NOT NULL | This column holds the position of this item in the argument list, or 0 for a function return value.                                                                                                                                                                            |
| SEQUENCE           | NUMBER         | NOT NULL | Defines the sequential order of the argument. Argument sequence starts from 1. Return type comes first, and each argument will follow.                                                                                                                                         |
| DATA_LEVEL         | NUMBER         | NOT NULL | Nesting depth of the argument for composite types<br><b>Note:</b> Starting with Oracle Database 18c, the value of this column is always 0, because this view displays only one row for each argument. This view no longer displays multiple rows for composite type arguments. |
| DATA_TYPE          | VARCHAR2 (30)  |          | Datatype of the argument                                                                                                                                                                                                                                                       |
| DEFAULTED          | VARCHAR2 (1)   |          | Specifies whether or not the argument is defaulted                                                                                                                                                                                                                             |

| DATA_LENGTH        | NUMBER         |          | Length of the column (in bytes)                                                                                                                                                                                                                                                |
| DATA_PRECISION     | NUMBER         |          | Length in decimal digits (NUMBER) or binary digits (FLOAT)                                                                                                                                                                                                                     |
| DATA_SCALE         | NUMBER         |          | Digits to the right of the decimal point in a number                                                                                                                                                                                                                           |
| RADIX              | NUMBER         |          | Argument radix for a number                                                                                                                                                                                                                                                    |
| CHARACTER_SET_NAME | VARCHAR2 (44)  |          | Character set name for the argument                                                                                                                                                                                                                                            |
| TYPE_OWNER         | VARCHAR2 (128) |          | Owner of the type of the argument                                                                                                                                                                                                                                              |
| TYPE_NAME          | VARCHAR2 (128) |          | Name of the type of the argument. If the type is a package local type (that is, it is declared in a package specification), then this column displays the name of the package.                                                                                                 |
| TYPE_SUBNAME       | VARCHAR2 (128) |          | Relevant only for package local types. Displays the name of the type declared in the package identified in the TYPE_NAME column.                                                                                                                                               |
| TYPE_LINK          | VARCHAR2 (128) |          | Relevant only for package local types when the package identified in the TYPE_NAME column is a remote package. This column displays the database link used to refer to the remote package.                                                                                     |
| TYPE_OBJECT_TYPE   | VARCHAR2 (7)   |          | Displays the type of the type described by the TYPE_OWNER, TYPE_NAME, and TYPE_SUBNAME columns. Possible values are: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• VIEW</li> <li>• PACKAGE</li> <li>• TYPE</li> </ul>                                              |
| PLS_TYPE           | VARCHAR2 (128) |          | For numeric arguments, the name of the PL/SQL type of the argument. Null otherwise.                                                                                                                                                                                            |

| Column        | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHAR_LENGTH   | NUMBER         |      | Character limit for string datatypes                                                                                                                                                                                                                                                                                                                                                     |
| CHAR_USED     | VARCHAR2 (1)   |      | Indicates whether the byte limit (B) or char limit (C) is official for the string                                                                                                                                                                                                                                                                                                        |
| ORIGIN_CON_ID | VARCHAR2 (256) |      | <p>The ID of the container where the data originates. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows in non-CDBs. This value is not used for CDBs.</li> <li><i>n</i>: This value is used for rows containing data that originate in the container with container ID <i>n</i> (<i>n</i> = 1 if the row originates in root)</li> </ul> |

**Note:**

To list the procedure names in a package, use the `ALL_PROCEduRES` view.

## 3.84 ALL\_ASSEMBLIES

`ALL_ASSEMBLIES` provides information about assemblies accessible to the current user.

### Related Views

- `DBA_ASSEMBLIES` provides information about all assemblies in the database.
- `USER_ASSEMBLIES` provides information about all assemblies owned by the current user. This view does not display the `OWNER` column.

| Column         | Datatype        | NULL     | Description                                         |
|----------------|-----------------|----------|-----------------------------------------------------|
| OWNER          | VARCHAR2 (128)  | NOT NULL | Owner of the assembly                               |
| ASSEMBLY_NAME  | VARCHAR2 (128)  | NOT NULL | Name of the assembly                                |
| FILE_SPEC      | VARCHAR2 (4000) |          | Operating system file specification of the assembly |
| SECURITY_LEVEL | VARCHAR2 (10)   |          | The maximum security level of the assembly          |
| IDENTITY       | VARCHAR2 (4000) |          | The identity of the assembly                        |

| Column | Datatype     | NULL | Description            |
|--------|--------------|------|------------------------|
| STATUS | VARCHAR2 (7) |      | Status of the assembly |

## 3.85 ALL\_ASSOCIATIONS

ALL\_ASSOCIATIONS describes user-defined statistics associated with objects accessible to the current user.

#### Related Views

- DBA\_ASSOCIATIONS describes all user-defined statistics in the database.
- USER\_ASSOCIATIONS describes user-defined statistics associated with objects owned by the current user.

| Column            | Datatype       | NULL     | Description                                                                                                                                                               |
|-------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_OWNER      | VARCHAR2 (128) | NOT NULL | Owner of the object for which the association is being defined                                                                                                            |
| OBJECT_NAME       | VARCHAR2 (128) | NOT NULL | Name of the object for which the association is being defined                                                                                                             |
| COLUMN_NAME       | VARCHAR2 (128) |          | Column name in the object for which the association is being defined                                                                                                      |
| OBJECT_TYPE       | VARCHAR2 (9)   |          | Kind of object with which statistics are being associated: column, type, package or function, indextype, or domain index.                                                 |
| STATSTYPE_SCHEMA  | VARCHAR2 (128) |          | Owner of the statistics type                                                                                                                                              |
| STATSTYPE_NAME    | VARCHAR2 (128) |          | Name of statistics type that contains the cost, selectivity or statistics functions                                                                                       |
| DEF_SELECTIVITY   | NUMBER         |          | Default selectivity of the object, if any                                                                                                                                 |
| DEF_CPU_COST      | NUMBER         |          | Default CPU cost of the object, if any                                                                                                                                    |
| DEF_IO_COST       | NUMBER         |          | Default I/O cost of the object, if any                                                                                                                                    |
| DEF_NET_COST      | NUMBER         |          | Default networking cost of the object, if any                                                                                                                             |
| INTERFACE_VERSION | NUMBER         |          | Identifies the version number of the <code>ODCIStats</code> interface. Value is 1 for statistics type implementing Oracle8i 8.1; 0 for types implementing Oracle9i 9.0.0. |
| MAINTENANCE_TYPE  | VARCHAR2 (14)  |          | Specifies whether the object is system-managed or user-managed                                                                                                            |

## 3.113 ALL\_ATTRIBUTE\_TRANSFORMATIONS

ALL\_ATTRIBUTE\_TRANSFORMATIONS describes the transformation functions for the transformations accessible to the current user.

#### Related Views

- DBA\_ATTRIBUTE\_TRANSFORMATIONS describes the transformation functions for all transformations in the database.
- USER\_ATTRIBUTE\_TRANSFORMATIONS describes the transformation functions for the transformations owned by the current user. This view does not display the OWNER column.

| Column            | Datatype       | NULL     | Description                              |
|-------------------|----------------|----------|------------------------------------------|
| TRANSFORMATION_ID | NUMBER         | NOT NULL | Unique identifier for the transformation |
| OWNER             | VARCHAR2 (128) | NOT NULL | Owning user of the transformation        |
| NAME              | VARCHAR2 (128) | NOT NULL | Transformation name                      |
| FROM_TYPE         | VARCHAR2 (257) |          | Source type name                         |
| TO_TYPE           | VARCHAR2 (385) |          | Target type name                         |

| Column                   | Datatype        | NULL     | Description                               |
|--------------------------|-----------------|----------|-------------------------------------------|
| ATTRIBUTE                | NUMBER          | NOT NULL | Target type attribute number              |
| ATTRIBUTE_TRANSFORMATION | VARCHAR2 (4000) |          | Transformation function for the attribute |

## 3.114 ALL\_AUDIT\_POLICIES

ALL\_AUDIT\_POLICIES describes the fine-grained auditing policies on the tables and views accessible to the current user.

 **Note:**

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

### Related Views

- DBA\_AUDIT\_POLICIES describes all fine-grained auditing policies in the database.
- USER\_AUDIT\_POLICIES describes the fine-grained auditing policies on the tables and views owned by the current user. This view does not display the OBJECT\_SCHEMA column.

| Column        | Datatype        | NULL | Description                                               |
|---------------|-----------------|------|-----------------------------------------------------------|
| OBJECT_SCHEMA | VARCHAR2 (128)  |      | Name of the schema that includes the table or view        |

## 3.115 ALL\_AUDIT\_POLICY\_COLUMNS

ALL\_AUDIT\_POLICY\_COLUMNS describes the fine-grained auditing policy columns on the tables and views accessible to the current user.

### Note:

This view is populated only in an Oracle Database where unified auditing is not enabled. When unified auditing is enabled in Oracle Database, the audit records are populated in the new audit trail and can be viewed from UNIFIED\_AUDIT\_TRAIL.

- See *Oracle Database Security Guide* for more information about unified auditing.
- See *Oracle Database Upgrade Guide* for more information about migrating to unified auditing.

### Related Views

- DBA\_AUDIT\_POLICY\_COLUMNS describes all fine-grained auditing policy columns in the database.
- USER\_AUDIT\_POLICY\_COLUMNS describes the fine-grained auditing policy columns on the tables and views owned by the current user.

| Column        | Datatype       | NULL | Description                   |
|---------------|----------------|------|-------------------------------|
| OBJECT_SCHEMA | VARCHAR2 (128) |      | Owner of the table or view    |
| OBJECT_NAME   | VARCHAR2 (128) |      | Name of the table or view     |
| POLICY_NAME   | VARCHAR2 (128) |      | Name of the policy            |
| POLICY_COLUMN | VARCHAR2 (128) |      | Relevant column of the policy |

## 3.116 ALL\_AW\_PS

ALL\_AW\_PS describes the page spaces in the analytic workspaces accessible to the current user.

### Related Views

- DBA\_AW\_PS describes the page spaces in all analytic workspaces in the database.
- USER\_AW\_PS describes the page spaces in the analytic workspaces owned by the current user. This view does not display the OWNER column.

| Column      | Datatype       | NULL     | Description                                    |
|-------------|----------------|----------|------------------------------------------------|
| OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the analytic workspace                |
| AW_NUMBER   | NUMBER         | NOT NULL | Number of the analytic workspace               |
| AW_NAME     | VARCHAR2 (128) |          | Name of the analytic workspace                 |
| PSNUMBER    | NUMBER (10)    |          | Number of the page space                       |
| GENERATIONS | NUMBER         |          | Number of active generations in the page space |
| MAXPAGES    | NUMBER         |          | Maximum pages allocated in the page space      |

## 3.118 ALL\_BASE\_TABLE\_MVIEWS

`ALL_BASE_TABLE_MVIEWS` describes the materialized views using materialized view logs accessible to the current user. A materialized view log can be created for a master, base table, or master materialized view. Query this view at the master site or the master materialized view site to show one row for each materialized view using a materialized view log.

**Related Views**

- `DBA_BASE_TABLE_MVIEWS` describes all materialized views using materialized view logs in the database.
- `USER_BASE_TABLE_MVIEWS` describes the materialized views using materialized view logs owned by the current user.

| Column                  | Datatype       | NULL     | Description                                                                  |
|-------------------------|----------------|----------|------------------------------------------------------------------------------|
| OWNER                   | VARCHAR2 (128) | NOT NULL | Schema in which the master table or the master materialized view was created |
| MASTER                  | VARCHAR2 (128) | NOT NULL | Name of the master table or the master materialized view                     |
| MVIEW_LAST_REFRESH_TIME | DATE           | NOT NULL | Date when the materialized view based on the master was last refreshed       |
| MVIEW_ID                | NUMBER (38)    |          | Unique identifier of the materialized view that is based on the master       |

## 3.119 ALL\_BLOCKCHAIN\_ROW\_VERSION\_COLS

`ALL_BLOCKCHAIN_ROW_VERSION_COLS` displays information about row versioned columns in the blockchain tables accessible to the current user.

**Related Views**

- `DBA_BLOCKCHAIN_ROW_VERSION_COLS` displays information about row versioned columns in all blockchain tables in the database.

- `USER_BLOCKCHAIN_ROW_VERSION_COLS` displays information about row versioned columns in the blockchain tables owned by the current user.

| Column           | Datatype       | NULL     | Description                                                                                                   |
|------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------|
| SCHEMA_NAME      | VARCHAR2 (128) | NOT NULL | Schema containing the blockchain table                                                                        |
| TABLE_NAME       | VARCHAR2 (128) | NOT NULL | Name of the blockchain table                                                                                  |
| ROW_VERSION_NAME | VARCHAR2 (128) | NOT NULL | Name of the row version                                                                                       |
| USER_CHAIN       | VARCHAR2 (3)   |          | Indicates whether row versioning with user chains is enabled for the blockchain table (YES) or not (NO)       |
| KEYCOL1_NAME     | VARCHAR2 (128) | NOT NULL | Name of version key column 1                                                                                  |
| KEYCOL2_NAME     | VARCHAR2 (128) |          | Name of version key column 2<br>Null if only one version key column is specified for the row version          |
| KEYCOL3_NAME     | VARCHAR2 (128) |          | Name of version key column 3<br>Null if only one or two version key columns are specified for the row version |

**Note:**

This view is available starting with Oracle Database 23ai.

- ["USER\\_BLOCKCHAIN\\_ROW\\_VERSION\\_COLS"](#)

## 3.120 ALL\_BLOCKCHAIN\_ROW\_VERSION\_HISTORY

`ALL_BLOCKCHAIN_ROW_VERSION_HISTORY` provides a history of row versions in the blockchain tables accessible to the current user.

This view is populated for a blockchain table with a row version only when rows are purged from that blockchain table. For each different value of the `PDB_GUID` and `KEYCOLn_VALUE` columns, information about only the youngest purged row is kept in the view.

**Related Views**

- `DBA_BLOCKCHAIN_ROW_VERSION_HISTORY` provides a history of row versions in all blockchain tables in the database.
- `USER_BLOCKCHAIN_ROW_VERSION_HISTORY` provides a history of row versions in the blockchain tables owned by the current user. This view does not display the `SCHEMA_NAME` column.

| Column      | Datatype       | NULL     | Description                            |
|-------------|----------------|----------|----------------------------------------|
| SCHEMA_NAME | VARCHAR2 (128) | NOT NULL | Schema containing the blockchain table |

| Column           | Datatype                     | NULL     | Description                                                                                                                                                |
|------------------|------------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLE_NAME       | VARCHAR2 (128)               | NOT NULL | Name of the blockchain table                                                                                                                               |
| ROW_VERSION_NAME | VARCHAR2 (128)               | NOT NULL | Name of the row version                                                                                                                                    |
| PDB_GUID         | RAW (16)                     |          | Global unique identifier of the pluggable database that inserted the row before any GoldenGate processes might have replicated the row to another database |
| KEYCOL1_VALUE    | VARCHAR2 (400)               |          | Value associated with version key column 1                                                                                                                 |

| TABLE_NAME    | VARCHAR2 (128) | NOT NULL | Name of the blockchain table                                                                                                                                                                                                                               |
| ROW_RETENTION | NUMBER         |          | Row retention period for the blockchain table, that is, the minimum number of days a row must be retained and cannot be deleted after it is inserted into the table<br>If the value of this column is NULL, then rows can never be deleted from the table. |

| Column                     | Datatype                     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|------------------------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROW_RETENTION_LOCKED       | VARCHAR2 (3)                 |      | Indicates whether the row retention period for the blockchain table is locked. Possible values: <ul style="list-style-type: none"> <li>• YES: The row retention period is locked. You cannot change the row retention period</li> <li>• NO: The row retention period is not locked. You can change the row retention period to a value higher than the current value with the SQL statement <code>ALTER TABLE ... NO DELETE UNTIL n DAYS AFTER INSERT</code></li> </ul> |
| TABLE_INACTIVITY_RETENTION | NUMBER                       |      | Number of days for which the blockchain table must be inactive before it can be dropped, that is, the number of days that must pass after the most recent row insertion before the table can be dropped<br>A table with no rows can be dropped at any time, regardless of this column value.                                                                                                                                                                            |
| HASH_ALGORITHM             | VARCHAR2 (8)                 |      | Algorithm used for computing the cryptographic hash for each table row                                                                                                                                                                                                                                                                                                                                                                                                  |
| TABLE_VERSION              | VARCHAR2 (7)                 |      | Blockchain table version. Possible values: <ul style="list-style-type: none"> <li>• V1</li> <li>• V2</li> </ul>                                                                                                                                                                                                                                                                                                                                                         |
| CURRENT_EPOCH              | NUMBER                       |      | Current epoch number for the blockchain table                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MAX_SYSTEM_CHAINS          | NUMBER                       |      | Number of system chains in each database instance that can link rows with a cryptographic hash                                                                                                                                                                                                                                                                                                                                                                          |
| DELETE_TIME                | TIMESTAMP (6) WITH TIME ZONE |      | Youngest threshold used to delete rows in the blockchain table                                                                                                                                                                                                                                                                                                                                                                                                          |

## 3.125 ALL\_CAPTURE

ALL\_CAPTURE displays information about the capture processes that enqueue the captured changes into queues accessible to the current user.

#### Related View

DBA\_CAPTURE displays information about all capture processes in the database.

| Column       | Datatype       | NULL | Description                                          |
|--------------|----------------|------|------------------------------------------------------|
| CAPTURE_NAME | VARCHAR2 (128) |      | Name of the capture process                          |
| QUEUE_NAME   | VARCHAR2 (128) |      | Name of the queue used for staging captured changes  |
| QUEUE_OWNER  | VARCHAR2 (128) |      | Owner of the queue used for staging captured changes |

| Column                  | Datatype       | NULL | Description                                                                                                                                                                                                                                                                   |
|-------------------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RULE_SET_NAME           | VARCHAR2 (128) |      | Name of the positive rule set used by the capture process for filtering                                                                                                                                                                                                       |
| RULE_SET_OWNER          | VARCHAR2 (128) |      | Owner of the positive rule set                                                                                                                                                                                                                                                |
| CAPTURE_USER            | VARCHAR2 (128) |      | Current user who is enqueueing captured messages                                                                                                                                                                                                                              |
| START_SCN               | NUMBER         |      | System change number (SCN) from which the capture process will start to capture changes. <code>START_SCN</code> is only modified as the result of an <code>ALTER_CAPTURE</code> statement or if the <code>FIRST_SCN</code> moves beyond the existing <code>START_SCN</code> . |
| STATUS                  | VARCHAR2 (8)   |      | Status of the capture process: <ul style="list-style-type: none"> <li>• DISABLED</li> <li>• ENABLED</li> <li>• ABORTED</li> </ul>                                                                                                                                             |
| CAPTURED_SCN            | NUMBER         |      | System change number (SCN) of the last redo log record scanned                                                                                                                                                                                                                |
| APPLIED_SCN             | NUMBER         |      | System change number (SCN) of the most recent message dequeued by the relevant apply processes. All changes below this SCN have been dequeued by all apply processes that apply changes captured by this capture process.                                                     |
| USE_DATABASE_LINK       | VARCHAR2 (3)   |      | Indicates whether the source database name is used as the database link to connect to the source database from the downstream database (YES) or not (NO). If the capture process was created at the source database, then this column will be NULL.                           |
| FIRST_SCN               | NUMBER         |      | System change number (SCN) from which the capture process can be restarted. <code>FIRST_SCN</code> indicates the lowest SCN to which the capture can be repositioned.                                                                                                         |
| SOURCE_DATABASE         | VARCHAR2 (128) |      | Global name of the source database                                                                                                                                                                                                                                            |
| SOURCE_DBID             | NUMBER         |      | Database ID of the source database                                                                                                                                                                                                                                            |
| SOURCE_RESETLOGS_SCN    | NUMBER         |      | Resetlogs system change number (SCN) of the source database                                                                                                                                                                                                                   |
| SOURCE_RESETLOGS_TIME   | NUMBER         |      | Resetlogs time of the source database                                                                                                                                                                                                                                         |
| LOGMINER_ID             | NUMBER         |      | Session ID of the Oracle LogMiner session associated with the capture process                                                                                                                                                                                                 |
| NEGATIVE_RULE_SET_NAME  | VARCHAR2 (128) |      | Name of the negative rule set used by the capture process for filtering                                                                                                                                                                                                       |
| NEGATIVE_RULE_SET_OWNER | VARCHAR2 (128) |      | Owner of the negative rule set used by the capture process for filtering                                                                                                                                                                                                      |
| MAX_CHECKPOINT_SCN      | NUMBER         |      | System change number (SCN) at which the last checkpoint was taken by the capture process                                                                                                                                                                                      |
| REQUIRED_CHECKPOINT_SCN | NUMBER         |      | Lowest checkpoint SCN for which the capture process requires redo information.<br><b>Note:</b> This SCN value does not necessarily correspond with a checkpoint SCN value.                                                                                                    |

## 3.126 ALL\_CAPTURE\_EXTRA\_ATTRIBUTES

ALL\_CAPTURE\_EXTRA\_ATTRIBUTES displays information about the extra attributes for the capture processes accessible to the current user.

**Related View**

DBA\_CAPTURE\_EXTRA\_ATTRIBUTES displays information about the extra attributes for all capture processes in the database.

| Column         | Datatype       | NULL     | Description                                                                    |
|----------------|----------------|----------|--------------------------------------------------------------------------------|
| CAPTURE_NAME   | VARCHAR2 (128) | NOT NULL | Name of the capture process                                                    |
| ATTRIBUTE_NAME | VARCHAR2 (128) | NOT NULL | Name of the extra attribute                                                    |
| INCLUDE        | VARCHAR2 (3)   |          | Indicates whether the extra attribute is included (YES) or not (NO)            |
| ROW_ATTRIBUTE  | VARCHAR2 (3)   |          | Indicates whether the extra attribute is a row LCR attribute (YES) or not (NO) |
| DDL_ATTRIBUTE  | VARCHAR2 (3)   |          | Indicates whether the extra attribute is a DDL LCR attribute (YES) or not (NO) |

## 3.127 ALL\_CAPTURE\_PARAMETERS

ALL\_CAPTURE\_PARAMETERS displays information about the parameters for the capture processes that enqueue the captured changes into queues accessible to the current user.

### Related View

DBA\_CAPTURE\_PARAMETERS displays information about the parameters for all capture processes in the database.

| Column          | Datatype        | NULL     | Description                                                                                                                                                                                                                    |
|-----------------|-----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CAPTURE_NAME    | VARCHAR2 (128)  | NOT NULL | Name of the capture process                                                                                                                                                                                                    |
| PARAMETER       | VARCHAR2 (128)  | NOT NULL | Name of the parameter                                                                                                                                                                                                          |
| VALUE           | VARCHAR2 (4000) |          | Parameter value                                                                                                                                                                                                                |
| SET_BY_USER     | VARCHAR2 (3)    |          | Indicates whether the parameter value was set by the user (YES) or was not set by the user (NO). If NO, then the parameter is set to its default value. If YES, then the parameter may or may not be set to its default value. |
| SOURCE_DATABASE | VARCHAR2 (128)  |          | Global name of the container for which the capture parameter is defined                                                                                                                                                        |

## 3.130 ALL\_CAPTURE\_PREPARED\_TABLES

ALL\_CAPTURE\_PREPARED\_TABLES displays information about the tables prepared for instantiation that are accessible to the current user at the local database.

### Related View

DBA\_CAPTURE\_PREPARED\_TABLES displays information about all tables prepared for instantiation at the local database.

| Column                   | Datatype      | NULL     | Description                                                                                                                                                 |
|--------------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLE_OWNER              | VARCHAR2(128) | NOT NULL | Owner of the table that is ready to be instantiated                                                                                                         |
| TABLE_NAME               | VARCHAR2(128) | NOT NULL | Name of the table that is ready to be instantiated                                                                                                          |
| SCN                      | NUMBER        | NOT NULL | Smallest system change number (SCN) for which the table can be instantiated                                                                                 |
| TIMESTAMP                | DATE          |          | Date and time at which the table was ready to be instantiated                                                                                               |
| SUPPLEMENTAL_LOG_DATA_PK | VARCHAR2(8)   |          | Status of table-level PRIMARY KEY COLUMNS supplemental logging: <ul style="list-style-type: none"><li>• IMPLICIT</li><li>• EXPLICIT</li><li>• NO</li></ul>  |
| SUPPLEMENTAL_LOG_DATA_UI | VARCHAR2(8)   |          | Status of table-level UNIQUE INDEX COLUMNS supplemental logging: <ul style="list-style-type: none"><li>• IMPLICIT</li><li>• EXPLICIT</li><li>• NO</li></ul> |
| SUPPLEMENTAL_LOG_DATA_FK | VARCHAR2(8)   |          | Status of table-level FOREIGN KEY COLUMNS supplemental logging: <ul style="list-style-type: none"><li>• IMPLICIT</li><li>• EXPLICIT</li><li>• NO</li></ul>  |

| Column                        | Datatype     | NULL | Description                                                                                                                                        |
|-------------------------------|--------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| SUPPLEMENTAL_LOG_DATA_AL<br>L | VARCHAR2 (8) |      | Status of table-level ALL COLUMNS supplemental logging: <ul style="list-style-type: none"><li>• IMPLICIT</li><li>• EXPLICIT</li><li>• NO</li></ul> |

## 3.131 ALL\_CATALOG

ALL\_CATALOG displays the tables, clusters, views, synonyms, and sequences accessible to the current user.

### Related Views

- DBA\_CATALOG displays all tables, clusters, views, synonyms, and sequences in the entire database.
- USER\_CATALOG displays the tables, clusters, views, synonyms, and sequences in the current user's schema. This view does not display the OWNER column.

| Column     | Datatype       | NULL     | Description                                                        |
|------------|----------------|----------|--------------------------------------------------------------------|
| OWNER      | VARCHAR2 (128) | NOT NULL | Owner of the TABLE, CLUSTER, VIEW, SYNONYM, SEQUENCE, or UNDEFINED |
| TABLE_NAME | VARCHAR2 (128) | NOT NULL | Name of the TABLE, CLUSTER, VIEW, SYNONYM, SEQUENCE, or UNDEFINED  |
| TABLE_TYPE | VARCHAR2 (11)  |          | Type of the TABLE, CLUSTER, VIEW, SYNONYM, SEQUENCE, or UNDEFINED  |

- "USER\_CATALOG"

## 3.132 ALL\_CERTIFICATES

ALL\_CERTIFICATES displays the certificates accessible to the current user which are used for signature verification for blockchain tables.

### Related Views

- DBA\_CERTIFICATES displays all certificates in the database which are used for signature verification for blockchain tables.
- USER\_CERTIFICATES displays the certificates added by the current user which are used for signature verification for blockchain tables. This view does not display the USER\_NAME column.

| Column             | Datatype        | NULL     | Description                                              |
|--------------------|-----------------|----------|----------------------------------------------------------|
| CERTIFICATE_ID     | RAW (16)        | NOT NULL | ID for the certificate                                   |
| USER_NAME          | VARCHAR2 (128)  | NOT NULL | User who added the certificate                           |
| DISTINGUISHED_NAME | VARCHAR2 (2000) |          | Uniquely identifies the entity that owns the certificate |
| CERTIFICATE        | BLOB            |          | Contents of the certificate                              |

### See Also:

- "DBA\_CERTIFICATES"
- "USER\_CERTIFICATES"

## 3.133 ALL\_CLUSTER\_HASH\_EXPRESSIONS

ALL\_CLUSTER\_HASH\_EXPRESSIONS displays hash functions for all hash clusters accessible to the current user.

### Related Views

- DBA\_CLUSTER\_HASH\_EXPRESSIONS displays hash functions for all hash clusters in the database.
- USER\_CLUSTER\_HASH\_EXPRESSIONS displays hash functions for all hash clusters owned by the current user.

| Column          | Datatype       | NULL     | Description                                   |
|-----------------|----------------|----------|-----------------------------------------------|
| OWNER           | VARCHAR2 (128) | NOT NULL | Owner of the cluster                          |
| CLUSTER_NAME    | VARCHAR2 (128) | NOT NULL | Name of the cluster                           |
| HASH_EXPRESSION | LONG           |          | Text of the hash function of the hash cluster |

## 3.134 ALL\_CLUSTERING\_DIMENSIONS

ALL\_CLUSTERING\_DIMENSIONS describes dimension tables associated with tables with an attribute clustering clause that the user owns or has system privileges for.

### Related Views

- DBA\_CLUSTERING\_DIMENSIONS describes dimension tables associated with all tables with an attribute clustering clause in the database.
- USER\_CLUSTERING\_DIMENSIONS describes dimension tables associated with tables with an attribute clustering clause owned by the user. This view does not display the OWNER column.

| Column          | Datatype       | NULL     | Description                             |
|-----------------|----------------|----------|-----------------------------------------|
| OWNER           | VARCHAR2 (128) | NOT NULL | Owner of the attribute clustering table |
| TABLE_NAME      | VARCHAR2 (128) | NOT NULL | Name of the attribute clustering table  |
| DIMENSION_OWNER | VARCHAR2 (128) | NOT NULL | Owner of the dimension table            |
| DIMENSION_NAME  | VARCHAR2 (128) | NOT NULL | Name of the dimension table             |

## 3.135 ALL\_CLUSTERING\_JOINS

ALL\_CLUSTERING\_JOINS describes joins to the dimension tables associated with tables with an attribute clustering clause the user owns or has system privileges for.

### Related Views

- DBA\_CLUSTERING\_JOINS describes joins to the dimension tables associated with all tables with an attribute clustering clause in the database.
- USER\_CLUSTERING\_JOINS describes joins to the dimension tables associated with tables with an attribute clustering clause owned by the user. This view does not display the OWNER column.

| Column      | Datatype       | NULL     | Description                             |
|-------------|----------------|----------|-----------------------------------------|
| OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the attribute clustering table |
| TABLE_NAME  | VARCHAR2 (128) | NOT NULL | Name of the attribute clustering table  |
| TAB1_OWNER  | VARCHAR2 (128) | NOT NULL | Table 1 owner of the join               |
| TAB1_NAME   | VARCHAR2 (128) | NOT NULL | Table 1 name of the join                |
| TAB1_COLUMN | VARCHAR2 (128) | NOT NULL | Table 1 column name of the join         |
| TAB2_OWNER  | VARCHAR2 (128) | NOT NULL | Table 2 owner of the join               |
| TAB2_NAME   | VARCHAR2 (128) | NOT NULL | Table 2 name of the join                |
| TAB2_COLUMN | VARCHAR2 (128) | NOT NULL | Table 2 column name of the join         |

## 3.136 ALL\_CLUSTERING\_KEYS

ALL\_CLUSTERING\_KEYS describes clustering keys for tables with an attribute clustering clause accessible to the user.

### Related Views

- DBA\_CLUSTERING\_KEYS describes clustering keys for all tables with an attribute clustering clause.
- USER\_CLUSTERING\_KEYS describes clustering keys for tables with an attribute clustering clause owned by the user.

| Column        | Datatype       | NULL     | Description                                                     |
|---------------|----------------|----------|-----------------------------------------------------------------|
| OWNER         | VARCHAR2 (128) | NOT NULL | Owner of the table on which the clustering clause is defined    |
| TABLE_NAME    | VARCHAR2 (128) | NOT NULL | Name of the table on which the clustering clause is defined     |
| DETAIL_OWNER  | VARCHAR2 (128) | NOT NULL | Owner of the detailed table contributing to the clustering keys |
| DETAIL_NAME   | VARCHAR2 (128) | NOT NULL | Name of the detailed table contributing to the clustering keys  |
| DETAIL_COLUMN | VARCHAR2 (128) | NOT NULL | Name of the detail column                                       |
| POSITION      | NUMBER         | NOT NULL | Position of the column in the clustering clause                 |
| GROUPID       | NUMBER         | NOT NULL | Group ID of the column in the clustering clause                 |

| CLUSTERING_TYPE    | VARCHAR2 (11)  |          | Clustering type: <ul style="list-style-type: none"><li>• INTERLEAVED</li><li>• LINEAR</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                   |
| ON_LOAD            | VARCHAR2 (3)   |          | Indicates whether Oracle will cluster data on load (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ON_DATAMOVEMENT    | VARCHAR2 (3)   |          | Indicates whether Oracle will cluster data on data movement, for example, partition move (YES), or not (NO)                                                                                                                                                                                                                                                                                                                                                                                       |
| VALID              | VARCHAR2 (3)   |          | Indicates if clustering is valid (YES) or not (NO).<br>For clustering with dimension tables, it is required that the joins of the fact table to the dimensions is via primary key or unique key on the dimension table. Therefore, dimension join keys must have a valid primary key or unique key constraint. If the primary key or unique key constraint is not valid, then clustering will not occur.<br>If there are no joins in the CLUSTERING clause, then the value of this column is YES. |
| WITH_ZONEMAP       | VARCHAR2 (3)   |          | Indicates if a zonemap was created with clustering (YES) or not (NO).                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LAST_LOAD_CLST     | TIMESTAMP (6)  |          | Last time the clustering occurred on load                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LAST_DATAMOVE_CLST | TIMESTAMP (6)  |          | Last time the clustering occurred on data movement, for example, partition move                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 3.138 ALL\_CLUSTERS

ALL\_CLUSTERS describes all clusters accessible to the current user.

### Related Views

- DBA\_CLUSTERS describes all clusters in the database.
- USER\_CLUSTERS describes all clusters owned by the current user. This view does not display the OWNER column.

| Column             | Datatype       | NULL     | Description                                                     |
|--------------------|----------------|----------|-----------------------------------------------------------------|
| OWNER              | VARCHAR2 (128) | NOT NULL | Owner of the cluster                                            |
| CLUSTER_NAME       | VARCHAR2 (128) | NOT NULL | Name of the cluster                                             |
| TABLESPACE_NAME    | VARCHAR2 (30)  | NOT NULL | Name of the tablespace containing the cluster                   |
| PCT_FREE           | NUMBER         |          | Minimum percentage of free space in a block                     |
| PCT_USED           | NUMBER         |          | Minimum percentage of used space in a block                     |
| KEY_SIZE           | NUMBER         |          | Estimated size of cluster key plus associated rows              |
| INI_TRANS          | NUMBER         | NOT NULL | Initial number of transactions                                  |
| MAX_TRANS          | NUMBER         | NOT NULL | Maximum number of transactions                                  |
| INITIAL_EXTENT     | NUMBER         |          | Size of the initial extent in bytes                             |
| NEXT_EXTENT        | NUMBER         |          | Size of secondary extents in bytes                              |
| MIN_EXTENTS        | NUMBER         | NOT NULL | Minimum number of extents allowed in the segment                |
| MAX_EXTENTS        | NUMBER         | NOT NULL | Maximum number of extents allowed in the segment                |
| PCT_INCREASE       | NUMBER         |          | Percentage increase in extent size                              |
| FREELISTS          | NUMBER         |          | Number of process freelists allocated to this segment           |
| FREELIST_GROUPS    | NUMBER         |          | Number of freelist groups allocated to this segment             |
| AVG_BLOCKS_PER_KEY | NUMBER         |          | Number of blocks in the table divided by number of cluster keys |

| Column           | Datatype      | NULL | Description                                                                                                                                                                                                                                 |
|------------------|---------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLUSTER_TYPE     | VARCHAR2 (5)  |      | Type of the cluster: <ul style="list-style-type: none"> <li>• INDEX - B*-Tree index</li> <li>• HASH - Hash</li> </ul>                                                                                                                       |
| FUNCTION         | VARCHAR2 (15) |      | If the cluster is a hash cluster, the hash function                                                                                                                                                                                         |
| HASHKEYS         | NUMBER        |      | If the cluster is a hash cluster, the number of hash keys (hash buckets)                                                                                                                                                                    |
| DEGREE           | VARCHAR2 (10) |      | Number of threads per instance for scanning the cluster, or DEFAULT                                                                                                                                                                         |
| INSTANCES        | VARCHAR2 (10) |      | Number of instances across which the cluster is to be scanned , or DEFAULT                                                                                                                                                                  |
| CACHE            | VARCHAR2 (5)  |      | Indicates whether the cluster is to be cached in the buffer cache (Y) or not (N)                                                                                                                                                            |
| BUFFER_POOL      | VARCHAR2 (7)  |      | Buffer pool to be used for cluster blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• RECYCLE</li> <li>• NULL</li> </ul>                                                                                   |
| FLASH_CACHE      | VARCHAR2 (7)  |      | Database Smart Flash Cache hint to be used for cluster blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> Solaris and Oracle Linux functionality only.                                     |
| CELL_FLASH_CACHE | VARCHAR2 (7)  |      | Cell flash cache hint to be used for cluster blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> <b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |
| SINGLE_TABLE     | VARCHAR2 (5)  |      | Indicates whether this is a single-table cluster (Y) or not (N)                                                                                                                                                                             |
| DEPENDENCIES     | VARCHAR2 (8)  |      | Indicates whether row-level dependency tracking is enabled (ENABLED) or disabled (DISABLED)                                                                                                                                                 |

## 3.139 ALL\_CODE\_ROLE\_PRIVS

ALL\_CODE\_ROLE\_PRIVS describes all the roles that are associated with program units owned or accessible by the current user.

### Related Views

- DBA\_CODE\_ROLE\_PRIVS describes all the roles that are associated with program units in the database.
- USER\_CODE\_ROLE\_PRIVS describes all the roles that are associated with program units owned by current user. This view does not display the OWNER column.

| Column      | Datatype       | NULL     | Description                         |
|-------------|----------------|----------|-------------------------------------|
| OWNER       | VARCHAR2 (128) | NOT NULL | Username of the owner of the object |
| OBJECT_NAME | VARCHAR2 (128) | NOT NULL | Name of the object                  |
| OBJECT_TYPE | VARCHAR2 (9)   |          | Type of the object                  |
| ROLE        | VARCHAR2 (128) | NOT NULL | The role associated with the object |

## 3.142 ALL\_COL\_PRIVS

ALL\_COL\_PRIVS describes the following types of grants:

- Column object grants for which the current user is the object owner, grantor, or grantee
- Column object grants for which an enabled role or PUBLIC is the grantee

**Related Views**

- DBA\_COL\_PRIVS describes all column object grants in the database.
- USER\_COL\_PRIVS describes the column object grants for which the current user is the object owner, grantor, or grantee.

| Column       | Datatype       | NULL | Description                                                                                                                                                                                                                                            |
|--------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANTOR      | VARCHAR2 (128) |      | Name of the user who performed the grant                                                                                                                                                                                                               |
| GRANTEE      | VARCHAR2 (128) |      | Name of the user or role to whom access was granted                                                                                                                                                                                                    |
| TABLE_SCHEMA | VARCHAR2 (128) |      | Schema of the object                                                                                                                                                                                                                                   |
| TABLE_NAME   | VARCHAR2 (128) |      | Name of the object                                                                                                                                                                                                                                     |
| COLUMN_NAME  | VARCHAR2 (128) |      | Name of the column                                                                                                                                                                                                                                     |
| PRIVILEGE    | VARCHAR2 (40)  |      | Privilege on the column: <ul style="list-style-type: none"><li>• INSERT</li><li>• REFERENCES</li><li>• UPDATE</li></ul>                                                                                                                                |
| GRANTABLE    | VARCHAR2 (3)   |      | Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)                                                                                                                                                                    |
| COMMON       | VARCHAR2 (3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"><li>• YES if the privilege was granted commonly (CONTAINER=ALL was used)</li><li>• NO if the privilege was granted locally (CONTAINER=ALL was not used)</li></ul> |
| INHERITED    | VARCHAR2 (3)   |      | Indicates whether the privilege grant was inherited from another container (YES) or not (NO)                                                                                                                                                           |

ALL\_COL\_PRIVS\_RECD describes the following types of grants:

- Column object grants for which the current user is the grantee
- Column object grants for which an enabled role or PUBLIC is the grantee

### Related View

USER\_COL\_PRIVS\_RECD describes the column object grants for which the current user is the grantee. This view does not display the GRANTEE column.

| Column      | Datatype       | NULL | Description                                                                                                                                                                                                                                               |
|-------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANTEE     | VARCHAR2 (128) |      | Name of the user or role to whom access was granted                                                                                                                                                                                                       |
| OWNER       | VARCHAR2 (128) |      | Owner of the object                                                                                                                                                                                                                                       |
| TABLE_NAME  | VARCHAR2 (128) |      | Name of the object                                                                                                                                                                                                                                        |
| COLUMN_NAME | VARCHAR2 (128) |      | Name of the column                                                                                                                                                                                                                                        |
| GRANTOR     | VARCHAR2 (128) |      | Name of the user who performed the grant                                                                                                                                                                                                                  |
| PRIVILEGE   | VARCHAR2 (40)  |      | Privilege on the column: <ul style="list-style-type: none"> <li>• INSERT</li> <li>• REFERENCES</li> <li>• UPDATE</li> </ul>                                                                                                                               |
| GRANTABLE   | VARCHAR2 (3)   |      | Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)                                                                                                                                                                       |
| COMMON      | VARCHAR2 (3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> <li>• YES if the privilege was granted commonly (CONTAINER=ALL was used)</li> <li>• NO if the privilege was granted locally (CONTAINER=ALL was not used)</li> </ul> |
| INHERITED   | VARCHAR2 (3)   |      | Indicates whether the privilege grant was inherited from another container (YES) or not (NO)                                                                                                                                                              |

## 3.145 ALL\_COLL\_TYPES

ALL\_COLL\_TYPES describes all named collection types (varrays and nested tables) accessible to the current user.

#### Related Views

- DBA\_COLL\_TYPES describes all named collection types in the database.
- USER\_COLL\_TYPES describes all named collection types owned by the current user. This view does not display the OWNER column.

| Column          | Datatype       | NULL     | Description                                                                                                   |
|-----------------|----------------|----------|---------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128) | NOT NULL | Owner of the collection                                                                                       |
| TYPE_NAME       | VARCHAR2 (128) | NOT NULL | Name of the collection                                                                                        |
| COLL_TYPE       | VARCHAR2 (128) | NOT NULL | Description of the collection, such as VARYING ARRAY, [nested] TABLE                                          |
| UPPER_BOUND     | NUMBER         |          | For varrays only, maximum size                                                                                |
| ELEM_TYPE_MOD   | VARCHAR2 (7)   |          | Type modifier of the element                                                                                  |
| ELEM_TYPE_OWNER | VARCHAR2 (128) |          | Owner of the type upon which the collection is based. This value is useful primarily for a user-defined type. |

| Column             | Datatype       | NULL | Description                                                                                                                                                   |
|--------------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ELEM_TYPE_NAME     | VARCHAR2 (128) |      | Name of the data type or user-defined type upon which the collection is based                                                                                 |
| LENGTH             | NUMBER         |      | Length of CHAR elements or maximum length of VARCHAR or VARCHAR2 elements                                                                                     |
| PRECISION          | NUMBER         |      | Decimal precision of NUMBER or DECIMAL elements; binary precision of FLOAT elements                                                                           |
| SCALE              | NUMBER         |      | Scale of NUMBER or DECIMAL elements                                                                                                                           |
| CHARACTER_SET_NAME | VARCHAR2 (44)  |      | Name of the character set (CHAR_CS   NCHAR_CS)                                                                                                                |
| ELEM_STORAGE       | VARCHAR2 (7)   |      | Obsolete column                                                                                                                                               |
| NULLS_STORED       | VARCHAR2 (3)   |      | Obsolete column                                                                                                                                               |
| CHAR_USED          | VARCHAR2 (1)   |      | Indicates whether the attribute uses BYTE length semantics (B) or CHAR length semantics (C). For NCHAR and NVARCHAR2 attribute types, this value is always C. |

## 3.147 ALL\_CONS\_OBJ\_COLUMNS

ALL\_CONS\_OBJ\_COLUMNS displays information about the types that object columns (or attributes) or collection elements have been constrained to, in the tables accessible to the current user.

### Related Views

- DBA\_CONS\_OBJ\_COLUMNS displays information about the types that object columns (or attributes) or collection elements have been constrained to, in all tables in the database.
- USER\_CONS\_OBJ\_COLUMNS displays information about the types that object columns (or attributes) or collection elements have been constrained to, in the tables owned by the current user. This view does not display the OWNER column.

| Column          | Datatype        | NULL | Description                                                      |
|-----------------|-----------------|------|------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128)  |      | Owner of the table                                               |
| TABLE_NAME      | VARCHAR2 (128)  |      | Name of the table containing the object column or attribute      |
| COLUMN_NAME     | VARCHAR2 (4000) |      | Fully qualified name of the object column or attribute           |
| CONS_TYPE_OWNER | VARCHAR2 (128)  |      | Owner of the type that the column (or element) is constrained to |
| CONS_TYPE_NAME  | VARCHAR2 (128)  |      | Name of the type that the column (or element) is constrained to  |

| Column         | Datatype      | NULL | Description                                                                                 |
|----------------|---------------|------|---------------------------------------------------------------------------------------------|
| CONS_TYPE_ONLY | VARCHAR2 (15) |      | Indicates whether the column (or element) is constrained to <b>ONLY</b> type (Y) or not (N) |

- [DBA\\_CONSTRAINTS](#) describes all constraint definitions in the database.
- [USER\\_CONSTRAINTS](#) describes constraint definitions on tables in the current user's schema.

| Column              | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER               | VARCHAR2 (128)  |      | Owner of the constraint definition                                                                                                                                                                                                                                                                                                                                                                                            |
| CONSTRAINT_NAME     | VARCHAR2 (128)  |      | Name of the constraint definition<br>If the constraint is defined in a data use case domain, this column displays a system-generated constraint name. The constraint name specified in the data use case domain is displayed in DOMAIN_CONSTRAINT_NAME.                                                                                                                                                                       |
| CONSTRAINT_TYPE     | VARCHAR2 (1)    |      | Type of the constraint definition: <ul style="list-style-type: none"> <li>• C - Check constraint on a table</li> <li>• P - Primary key</li> <li>• U - Unique key</li> <li>• R - Referential integrity</li> <li>• V - With check option, on a view</li> <li>• O - With read only, on a view</li> <li>• H - Hash expression</li> <li>• F - Constraint that involves a REF column</li> <li>• S - Supplemental logging</li> </ul> |
| TABLE_NAME          | VARCHAR2 (128)  |      | Name associated with the table (or view) with the constraint definition                                                                                                                                                                                                                                                                                                                                                       |
| SEARCH_CONDITION    | LONG            |      | Text of search condition for a check constraint. This column returns the correct value only when the row originates from the current container.                                                                                                                                                                                                                                                                               |
| SEARCH_CONDITION_VC | VARCHAR2 (4000) |      | Text of search condition for a check constraint. This column may truncate the search condition.                                                                                                                                                                                                                                                                                                                               |
| R_OWNER             | VARCHAR2 (128)  |      | Owner of the table referred to in a referential constraint                                                                                                                                                                                                                                                                                                                                                                    |
| R_CONSTRAINT_NAME   | VARCHAR2 (128)  |      | Name of the unique constraint definition for the referenced table                                                                                                                                                                                                                                                                                                                                                             |

| Column                 | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| DOMAIN_CONSTRAINT_NAME | VARCHAR2 (128) |      | If the constraint is inherited from a data use case domain, the name of the constraint definition, as specified in the data use case domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DELETE_RULE            | VARCHAR2 (9)   |      | Delete rule for a referential constraint: <ul style="list-style-type: none"> <li>CASCADE</li> <li>SET NULL</li> <li>NO ACTION</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| STATUS                 | VARCHAR2 (8)   |      | Enforcement status of the constraint: <ul style="list-style-type: none"> <li>ENABLED</li> <li>DISABLED</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| DEFERRABLE             | VARCHAR2 (14)  |      | Indicates whether the constraint is deferrable (DEFERRABLE) or not (NOT DEFERRABLE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| DEFERRED               | VARCHAR2 (9)   |      | Indicates whether the constraint was initially deferred (DEFERRED) or not (IMMEDIATE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| VALIDATED              | VARCHAR2 (13)  |      | When STATUS = ENABLED, possible values are: <ul style="list-style-type: none"> <li>VALIDATED - All data obeys the constraint (that is, the existing data in the table was validated when the constraint was enabled, as well as any subsequent data entered into the table)</li> <li>NOT VALIDATED - All data may not obey the constraint (that is, the existing data in the table was not validated when the constraint was enabled, but subsequent data entered into the table was validated)</li> </ul> When STATUS = DISABLED, possible values are: <ul style="list-style-type: none"> <li>VALIDATED - All data obeys the constraint, but the unique index on the constraint has been dropped. This setting is useful in data warehousing environments, but has some restrictions. Refer to <i>Oracle Database Data Warehousing Guide</i> for more information on this setting.</li> <li>NOT VALIDATED - All data may not obey the constraint</li> </ul> |
| GENERATED              | VARCHAR2 (14)  |      | Indicates whether the name of the constraint is user-generated (USER NAME) or system-generated (GENERATED NAME)<br><br>If the constraint is defined in a data use case domain, the value of this column is always GENERATED NAME and applies to the system-generated name for the constraint (CONSTRAINT_NAME), not the user-specified name for the constraint (DOMAIN_CONSTRAINT_NAME).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Column        | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                       |
|---------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BAD           | VARCHAR2 (3)   |      | Indicates whether this constraint specifies a century in an ambiguous manner (BAD) or not (NULL). To avoid errors resulting from this ambiguity, rewrite the constraint using the TO_DATE function with a four-digit year.<br><b>See Also:</b> the TO_DATE function in <i>Oracle Database SQL Language Reference</i> and <i>Oracle Database Development Guide</i> |
| RELY          | VARCHAR2 (4)   |      | When VALIDATED = NOT VALIDATED, this column indicates whether the constraint is to be taken into account for query rewrite (RELY) or not (NULL).<br>When VALIDATED = VALIDATED, this column is not meaningful.<br><b>See Also:</b> constraints in <i>Oracle Database SQL Language Reference</i>                                                                   |
| PRECHECK      | VARCHAR2 (10)  |      | Indicates whether the constraint is a precheckable JSON constraint (PRECHECK) or not (NOPRECHECK)                                                                                                                                                                                                                                                                 |
| LAST_CHANGE   | DATE           |      | When the constraint was last enabled or disabled                                                                                                                                                                                                                                                                                                                  |
| INDEX_OWNER   | VARCHAR2 (128) |      | Name of the user owning the index                                                                                                                                                                                                                                                                                                                                 |
| INDEX_NAME    | VARCHAR2 (128) |      | Name of the index (only shown for unique and primary-key constraints)                                                                                                                                                                                                                                                                                             |
| INVALID       | VARCHAR2 (7)   |      | Indicates whether the constraint is invalid (INVALID) or not (NULL)                                                                                                                                                                                                                                                                                               |
| VIEW_RELATED  | VARCHAR2 (14)  |      | Indicates whether the constraint depends on a view (DEPEND ON VIEW) or not (NULL)                                                                                                                                                                                                                                                                                 |
| ORIGIN_CON_ID | VARCHAR2 (256) |      | The ID of the container where the data originates. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows in non-CDBs. This value is not used for CDBs.</li><li>n: This value is used for rows containing data that originate in the container with container ID n (n = 1 if the row originates in root)</li></ul>         |

## 3.149 ALL\_CONTEXT

ALL\_CONTEXT describes all context namespaces in the current session for which attributes and values have been specified using the DBMS\_SESSION.SET\_CONTEXT procedure. This view does not display the TYPE and ORIGIN\_CON\_ID columns.

### Related View

DBA\_CONTEXT describes all context namespaces defined in the database, regardless whether any attributes have been specified for them using the DBMS\_SESSION.SET\_CONTEXT procedure.

| Column    | Datatype       | NULL     | Description                                                                         |
|-----------|----------------|----------|-------------------------------------------------------------------------------------|
| NAMESPACE | VARCHAR2 (128) | NOT NULL | Name of the context namespace                                                       |
| SCHEMA    | VARCHAR2 (128) | NOT NULL | Schema name of the designated package that can set attributes using this namespace  |
| PACKAGE   | VARCHAR2 (128) | NOT NULL | Package name of the designated package that can set attributes using this namespace |

## 3.150 ALL\_CREDENTIALS

ALL\_CREDENTIALS lists all credentials visible to the user.

### Related Views

- DBA\_CREDENTIALS lists all credentials in the database.
- USER\_CREDENTIALS lists credentials owned by the current user. This view does not display the OWNER column.

| Column          | Datatype        | NULL     | Description                                                                                                 |
|-----------------|-----------------|----------|-------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128)  | NOT NULL | Owner of the credential                                                                                     |
| CREDENTIAL_NAME | VARCHAR2 (128)  | NOT NULL | Name of the credential                                                                                      |
| USERNAME        | VARCHAR2 (128)  |          | Name of the user that will be used to log in to the remote database or the remote or local operating system |
| WINDOWS_DOMAIN  | VARCHAR2 (30)   |          | For a Windows target, the Windows domain to use when logging in                                             |
| COMMENTS        | VARCHAR2 (4000) |          | Comments on the credential                                                                                  |
| ENABLED         | VARCHAR2 (5)    |          | Indicates whether this credential is enabled (TRUE) or not (FALSE)                                          |

**Note:**

DBMS\_CREDENTIAL lists credentials that can be used to run external procedures, or by DBMS\_SCHEDULER for remote or external jobs, or for storing or retrieving files from the operating system.

If a credential is disabled, then any of the actions above that attempts to use the credential will fail.

## 3.151 ALL\_CUBE\_ATTR\_VISIBILITY

ALL\_CUBE\_ATTR\_VISIBILITY describes the OLAP attributes visible for the dimensions, hierarchies, and levels accessible to the current user.

**Related Views**

- DBA\_CUBE\_ATTR\_VISIBILITY describes all OLAP attributes visible for the dimensions, hierarchies, and levels in the database.
- USER\_CUBE\_ATTR\_VISIBILITY describes the OLAP attributes visible for the dimensions, hierarchies, and levels owned by the current user. This view does not display the OWNER column.

| Column         | Datatype       | NULL | Description                                                                  |
|----------------|----------------|------|------------------------------------------------------------------------------|
| OWNER          | VARCHAR2 (128) |      | Owner of the cube dimension                                                  |
| DIMENSION_NAME | VARCHAR2 (128) |      | Name of a cube dimension (such as TIME)                                      |
| ATTRIBUTE_NAME | VARCHAR2 (128) |      | Name of an attribute of the dimension (such as LONG_DESCRIPTION or END_DATE) |
| HIERARCHY_NAME | VARCHAR2 (128) |      | Name of a hierarchy for the dimension (such as CALENDAR)                     |
| LEVEL_NAME     | VARCHAR2 (128) |      | Name of the dimension level (such as MONTH)                                  |

| Column    | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|--------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FROM_TYPE | VARCHAR2(10) |      | Identifies the dimension type that the current row derives the attribute visibility from. Possible values: <ul style="list-style-type: none"> <li>DIMENSION - Derives the attribute visibility from itself.</li> <li>HIERARCHY - Derives the attribute visibility from the VisibleAttributes explicitly set on the associated DIMENSION or itself.</li> <li>DIM_LEVEL - Derives the attribute visibility from the VisibleAttributes explicitly set on the associated DIMENSION or itself.</li> <li>HIER_LEVEL - Derives the attribute visibility from the VisibleAttributes explicitly set on the associated DIMENSION, HIERARCHY, DIM_LEVEL, or itself.</li> </ul> |
| TO_TYPE   | VARCHAR2(10) |      | Identifies the dimension type for the current row. Possible values: <ul style="list-style-type: none"> <li>DIMENSION - When the TO_TYPE is DIMENSION, then only the DIMENSION_NAME is populated.</li> <li>HIERARCHY - When the TO_TYPE is HIERARCHY, then only the DIMENSION_NAME and HIERARCHY_NAME are populated.</li> <li>DIM_LEVEL - When the TO_TYPE is DIM_LEVEL, then only the DIMENSION_NAME and LEVEL_NAME are populated.</li> <li>HIER_LEVEL - When the TO_TYPE is HIER_LEVEL, then only the HIERARCHY_NAME and LEVEL_NAME are populated.</li> </ul>                                                                                                      |

## 3.153 ALL\_CUBE\_BUILD\_PROCESSES

ALL\_CUBE\_BUILD\_PROCESSES describes the OLAP build processes and maintenance scripts accessible to the current user.

### Related Views

- DBA\_CUBE\_BUILD\_PROCESSES describes all OLAP build processes and maintenance scripts in the database.
- USER\_CUBE\_BUILD\_PROCESSES describes the OLAP build processes and maintenance scripts owned by the current user. This view does not display the OWNER column.

| Column             | Datatype        | NULL     | Description                                              |
|--------------------|-----------------|----------|----------------------------------------------------------|
| OWNER              | VARCHAR2 (128)  | NOT NULL | Owner of the build process                               |
| BUILD_PROCESS_NAME | VARCHAR2 (128)  | NOT NULL | Name of the build process                                |
| BUILD_PROCESS_ID   | NUMBER          | NOT NULL | ID of the build process                                  |
| BUILD_PROCESS      | CLOB            |          | Syntax of the build process                              |
| DESCRIPTION        | NVARCHAR2 (300) |          | Description of the build process in the session language |

## 3.154 ALL\_CUBE\_CALCULATED\_MEMBERS

ALL\_CUBE\_CALCULATED\_MEMBERS describes the calculated members for the OLAP cube dimensions accessible to the current user.

### Related Views

- DBA\_CUBE\_CALCULATED\_MEMBERS describes the calculated members for all OLAP cube dimensions in the database.
- USER\_CUBE\_CALCULATED\_MEMBERS describes the calculated members for the OLAP cube dimensions owned by the current user. This view does not display the OWNER column.

| Column              | Datatype       | NULL     | Description                                                                     |
|---------------------|----------------|----------|---------------------------------------------------------------------------------|
| OWNER               | VARCHAR2 (128) | NOT NULL | Owner of the cube dimension                                                     |
| DIMENSION_NAME      | VARCHAR2 (128) | NOT NULL | Name of a cube dimension                                                        |
| MEMBER_NAME         | VARCHAR2 (128) | NOT NULL | Name of a calculated member in the cube dimension                               |
| IS_CUSTOM_AGGREGATE | VARCHAR2 (3)   |          | Indicates whether the calculated member is a custom aggregate (YES) or not (NO) |

| Column       | Datatype      | NULL | Description                                                                                                                                                                                                                              |
|--------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STORAGE_TYPE | VARCHAR2 (10) |      | Storage type of the calculated member: <ul style="list-style-type: none"><li>DYNAMIC - Value of the member is calculated for a query</li><li>PRECOMPUTE - Value of the member is calculated and stored during data maintenance</li></ul> |
| EXPRESSION   | CLOB          |      | Expression used to generate the value of the calculated member                                                                                                                                                                           |

## 3.159 ALL\_CUBE\_DIMENSIONALITY

ALL\_CUBE\_DIMENSIONALITY describes the dimension order for the OLAP cubes accessible to the current user.

### Related Views

- DBA\_CUBE\_DIMENSIONALITY describes the dimension order for all OLAP cubes in the database.
- USER\_CUBE\_DIMENSIONALITY describes the dimension order for the OLAP cubes owned by the current user. This view does not display the OWNER column.

| Column              | Datatype       | NULL     | Description                                                                                                                                                                                                                                    |
|---------------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER               | VARCHAR2 (128) | NOT NULL | Owner of the cube                                                                                                                                                                                                                              |
| CUBE_NAME           | VARCHAR2 (128) | NOT NULL | Name of a cube, such as UNITS_CUBE                                                                                                                                                                                                             |
| DIMENSION_NAME      | VARCHAR2 (128) | NOT NULL | Name of a dimension of the cube, such as PRODUCT                                                                                                                                                                                               |
| DIMENSIONALITY_NAME | VARCHAR2 (200) |          | The name of a dimensionality of the cube. For example, a cube dimensioned by the PRODUCT dimension can have a product dimension named PRODUCT_DIM.                                                                                             |
| DIMENSIONALITY_ID   | NUMBER         | NOT NULL | ID of the cube dimensionality                                                                                                                                                                                                                  |
| ORDER_NUM           | NUMBER         | NOT NULL | Order number of the dimension in the cube                                                                                                                                                                                                      |
| IS_SPARSE           | NUMBER         |          | Indicates whether the dimension is sparse in the cube (1) or not sparse (0)                                                                                                                                                                    |
| ET_ATTR_PREFIX      | VARCHAR2 (200) |          | Specifies the prefix that will be added to the column names in the Materialized Views to ensure uniqueness. If the user does not specify an ET_ATTR_PREFIX for any dimensions in a cube, then they default in the pattern D1_, D2_, and so on. |

| DESCRIPTION         | NVARCHAR2 (300) |          | Description of the measure in the session language                                                                                                                                                                             |
| DATA_TYPE           | VARCHAR2 (106)  |          | Data type of the measure, such as NUMBER                                                                                                                                                                                       |
| DATA_LENGTH         | NUMBER          | NOT NULL | Length of a character data type                                                                                                                                                                                                |
| DATA_PRECISION      | NUMBER          |          | Precision of a numeric data type                                                                                                                                                                                               |
| DATA_SCALE          | NUMBER          |          | Scale of a numeric data type                                                                                                                                                                                                   |
| LOOP_VAR_OVERRIDE   | VARCHAR2 (200)  |          | The value that overrides the \$LOOP_VAR property of the OLAP derived measure                                                                                                                                                   |
| LOOP_DENSE_OVERRIDE | VARCHAR2 (200)  |          | The value that overrides the \$LOOP_DENSE property of the OLAP derived measure                                                                                                                                                 |
| LOOP_TYPE           | VARCHAR2 (200)  |          | The \$LOOP_TYPE property of the OLAP derived measure. <p>Possible values:</p> <ul style="list-style-type: none"> <li>• INNER</li> <li>• OUTER</li> <li>• DENSE</li> </ul>                                                      |

## 3.166 ALL\_CUBE\_NAMED\_BUILD\_SPECS

ALL\_CUBE\_NAMED\_BUILD\_SPECS describes the OLAP cube named build specifications in the database that are accessible by the user.

**Related Views**

- DBA\_CUBE\_NAMED\_BUILD\_SPECS describes the OLAP cube named build specifications in the database.
- USER\_CUBE\_NAMED\_BUILD\_SPECS describes the OLAP cube named build specifications in the database that are owned by the current user. This view does not display the OWNER column.

| Column           | Datatype       | NULL     | Description                                     |
|------------------|----------------|----------|-------------------------------------------------|
| OWNER            | VARCHAR2 (128) | NOT NULL | Owner of the OLAP named build specification     |
| CUBE_NAME        | VARCHAR2 (128) | NOT NULL | Name of the OLAP cube                           |
| NAMED_BUILD_SPEC | CLOB           |          | Name of the OLAP cube named build specification |

## 3.167 ALL\_CUBE\_SUB\_PARTITION\_LEVELS

ALL\_CUBE\_SUB\_PARTITION\_LEVELS describes the OLAP secondary partition levels in the database that are accessible by the user.

**Related Views**

- DBA\_CUBE\_SUB\_PARTITION\_LEVELS describes the OLAP secondary partition levels in the database.
- USER\_CUBE\_SUB\_PARTITION\_LEVELS describes the OLAP secondary partition levels in the database that are owned by the current user. This view does not display the OWNER column.

| Column    | Datatype       | NULL | Description                                 |
|-----------|----------------|------|---------------------------------------------|
| OWNER     | VARCHAR2 (128) |      | Owner of the OLAP secondary partition level |
| CUBE_NAME | VARCHAR2 (128) |      | Name of the OLAP cube                       |

| Column                    | Datatype       | NULL | Description                                                                                 |
|---------------------------|----------------|------|---------------------------------------------------------------------------------------------|
| SUB_PARTITION_LEVEL_NAME  | VARCHAR2 (200) |      | Name of the secondary partition level of the OLAP cube                                      |
| PRECOMPUTE_PERCENT        | NUMBER         |      | Precompute percent of the secondary partition level of the OLAP cube                        |
| PARTITION_DIMENSION_NAME  | VARCHAR2 (128) |      | Name of the cube dimension for which there is a secondary partition level on the OLAP cube  |
| PARTITION_HIERARCHY_NAME  | VARCHAR2 (128) |      | Name of the hierarchy for which there is a secondary partition level on the OLAP cube       |
| PARTITION_LEVEL_NAME      | VARCHAR2 (128) |      | Name of the hierarchy level for which there is a secondary partition level on the OLAP cube |
| SUB_PARTITION_LEVEL_ORDER | NUMBER         |      | Order number of the secondary partition level on the OLAP cube                              |

## 3.168 ALL\_CUBE\_VIEW\_COLUMNS

ALL\_CUBE\_VIEW\_COLUMNS describes the columns of the relational views of the OLAP cubes accessible to the current user.

#### Related Views

- DBA\_CUBE\_VIEW\_COLUMNS describes the columns of relational views of all OLAP cubes in the database.
- USER\_CUBE\_VIEW\_COLUMNS describes the columns of relational views of OLAP cubes owned by the current user. This view does not display the OWNER column.

| Column      | Datatype       | NULL | Description                                                                                    |
|-------------|----------------|------|------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2 (128) |      | Owner of the cube                                                                              |
| CUBE_NAME   | VARCHAR2 (128) |      | Name of a cube, such as UNITS_CUBE                                                             |
| VIEW_NAME   | VARCHAR2 (128) |      | Name of a view of the cube, such as PRODUCT_VIEW                                               |
| COLUMN_NAME | VARCHAR2 (128) |      | Name of a column in the view, such as DIM_KEY or LEVEL_NAME                                    |
| COLUMN_TYPE | VARCHAR2 (7)   |      | Type of the column: <ul style="list-style-type: none"> <li>• MEASURE</li> <li>• KEY</li> </ul> |
| OBJECT_NAME | VARCHAR2 (128) |      | Name of the measure or dimension represented in the column                                     |

## 3.169 ALL\_CUBE\_VIEWS

ALL\_CUBE\_VIEWS describes the relational views of the OLAP cubes accessible to the current user.

**Related Views**

- DBA\_CUBE\_VIEWS describes the relational views of all OLAP cubes in the database.
- USER\_CUBE\_VIEWS describes the relational views of the OLAP cubes owned by the current user. This view does not display the OWNER column.

| Column    | Datatype       | NULL     | Description                                         |
|-----------|----------------|----------|-----------------------------------------------------|
| OWNER     | VARCHAR2 (128) | NOT NULL | Owner of the cube                                   |
| CUBE_NAME | VARCHAR2 (128) | NOT NULL | Name of a cube, such as UNITS_CUBE                  |
| VIEW_NAME | VARCHAR2 (128) | NOT NULL | Name of a view of the cube, such as UNITS_CUBE_VIEW |

**See Also:**

- "DBA\_CUBE\_VIEWS"
- "USER\_CUBE\_VIEWS"

## 3.170 ALL\_CUBES

ALL\_CUBES describes the OLAP cubes accessible to the current user.

**Related Views**

- DBA\_CUBES describes all OLAP cubes in the database.
- USER\_CUBES describes the OLAP cubes owned by the current user. This view does not display the OWNER column.

| Column                | Datatype       | NULL     | Description                                                           |
|-----------------------|----------------|----------|-----------------------------------------------------------------------|
| OWNER                 | VARCHAR2 (128) |          | Owner of the cube                                                     |
| CUBE_NAME             | VARCHAR2 (128) | NOT NULL | Name of a cube, such as UNITS_CUBE                                    |
| CUBE_ID               | NUMBER         | NOT NULL | ID of a cube                                                          |
| AW_NAME               | VARCHAR2 (128) |          | Name of the analytic workspace that contains the cube, such as GLOBAL |
| CONSISTENT_SOLVE_SPEC | CLOB           |          | Default aggregation rules for the cube                                |

| Column                   | Datatype        | NULL | Description                                                                                                                                                                |
|--------------------------|-----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DESCRIPTION              | NVARCHAR2 (300) |      | Description of the cube in the session language                                                                                                                            |
| SPARSE_TYPE              | VARCHAR2 (200)  |      | Text value indicating the type of sparsity for the OLAP cube                                                                                                               |
| PRECOMPUTE_CONDITION     | CLOB            |      | Condition syntax representing the precompute condition of the OLAP cube                                                                                                    |
| PRECOMPUTE_PERCENT       | NUMBER          |      | Percentage of aggregate data values that are calculated and stored during data maintenance. If the cube is partitioned, then this percentage is for the bottom partitions. |
| PRECOMPUTE_PERCENT_TOP   | NUMBER          |      | Percentage of aggregate data values in the top partition that are calculated and stored during data maintenance                                                            |
| PARTITION_DIMENSION_NAME | VARCHAR2 (128)  |      | Name of the dimension used to partition the cube, such as <code>TIME</code>                                                                                                |
| PARTITION_HIERARCHY_NAME | VARCHAR2 (128)  |      | Name of the dimension hierarchy used to partition the cube, such as <code>CALENDAR</code>                                                                                  |
| PARTITION_LEVEL_NAME     | VARCHAR2 (128)  |      | Name of the level used to partition the cube, such as <code>QUARTER</code>                                                                                                 |
| REFRESH_MVIEW_NAME       | VARCHAR2 (200)  |      | Name of the refresh materialized view for the OLAP cube                                                                                                                    |
| REWRITE_MVIEW_NAME       | VARCHAR2 (200)  |      | Name of the rewrite materialized view for the OLAP cube                                                                                                                    |
| DEFAULT_BUILD_SPEC       | CLOB            |      | The default build specification for the OLAP cube                                                                                                                          |
| MEASURE_STORAGE          | VARCHAR2 (200)  |      | The measure storage for the OLAP cube. Possible values: <ul style="list-style-type: none"> <li>• <code>INDEPENDENT</code></li> <li>• <code>SHARED</code></li> </ul>        |
| SQL_CUBE_STORAGE_TYPE    | CLOB            |      | The SQL cube storage type for the OLAP cube. This value represents a SQL data type.                                                                                        |
| CUBE_STORAGE_TYPE        | VARCHAR2 (200)  |      | The cube storage type for the OLAP cube. This value represents a DML data type.                                                                                            |

## 3.172 ALL\_DEF\_AUDIT\_OPTS

ALL\_DEF\_AUDIT\_OPTS contains default object-auditing options that will be applied when objects are created.

The output for each column takes one of the following forms:

- -/-: no default auditing
- S/-: auditing whenever successful
- -/S: auditing whenever not successful

**Note:**

This view is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored and are viewable with this view. See *Oracle Database Security Guide* for more information about how this desupport works.

| Column | Datatype     | NULL | Description                                           |
|--------|--------------|------|-------------------------------------------------------|
| ALT    | VARCHAR2 (3) |      | Auditing ALTER WHENEVER SUCCESSFUL / UNSUCCESSFUL     |
| AUD    | VARCHAR2 (3) |      | Auditing AUDIT WHENEVER SUCCESSFUL / UNSUCCESSFUL     |
| COM    | VARCHAR2 (3) |      | Auditing COMMENT WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| DEL    | VARCHAR2 (3) |      | Auditing DELETE WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| GRA    | VARCHAR2 (3) |      | Auditing GRANT WHENEVER SUCCESSFUL / UNSUCCESSFUL     |
| IND    | VARCHAR2 (3) |      | Auditing INDEX WHENEVER SUCCESSFUL / UNSUCCESSFUL     |
| INS    | VARCHAR2 (3) |      | Auditing INSERT WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| LOC    | VARCHAR2 (3) |      | Auditing LOCK WHENEVER SUCCESSFUL / UNSUCCESSFUL      |
| REN    | VARCHAR2 (3) |      | Auditing RENAME WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| SEL    | VARCHAR2 (3) |      | Auditing SELECT WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| UPD    | VARCHAR2 (3) |      | Auditing UPDATE WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| EXE    | VARCHAR2 (3) |      | Auditing EXECUTE WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| FBK    | VARCHAR2 (3) |      | Auditing FLASHBACK WHENEVER SUCCESSFUL / UNSUCCESSFUL |
| REA    | VARCHAR2 (3) |      | Auditing READ WHENEVER SUCCESSFUL / UNSUCCESSFUL      |

## 3.173 ALL\_DEPENDENCIES

ALL\_DEPENDENCIES describes dependencies between procedures, packages, functions, package bodies, and triggers accessible to the current user, including dependencies on views created without any database links. This view does not display the SCHEMAID column.

### Related Views

- DBA\_DEPENDENCIES describes all dependencies between objects in the database. This view does not display the SCHEMAID column.
- USER\_DEPENDENCIES describes dependencies between objects in the current user's schema. This view does not display the OWNER column.

| Column | Datatype       | NULL     | Description         |
|--------|----------------|----------|---------------------|
| OWNER  | VARCHAR2 (128) | NOT NULL | Owner of the object |

| Column               | Datatype       | NULL     | Description                                                                                                         |
|----------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------|
| NAME                 | VARCHAR2 (128) | NOT NULL | Name of the object                                                                                                  |
| TYPE                 | VARCHAR2 (18)  |          | Type of the object                                                                                                  |
| REFERENCED_OWNER     | VARCHAR2 (128) |          | Owner of the referenced object (remote owner if remote object)                                                      |
| REFERENCED_NAME      | VARCHAR2 (128) |          | Name of the referenced object                                                                                       |
| REFERENCED_TYPE      | VARCHAR2 (18)  |          | Type of the referenced object                                                                                       |
| REFERENCED_LINK_NAME | VARCHAR2 (128) |          | Name of the link to the parent object (if remote)                                                                   |
| DEPENDENCY_TYPE      | VARCHAR2 (4)   |          | Indicates whether the dependency is a <code>REF</code> dependency ( <code>REF</code> ) or not ( <code>HARD</code> ) |

## 3.174 ALL\_DEQUEUE\_QUEUES

`ALL_DEQUEUE_QUEUES` describes all queues on which the current user has dequeue privileges. If the user has any Advanced Queuing system privileges, such as `DEQUEUE ANY QUEUE` or `MANAGE ANY QUEUE`, then this view describes all queues in the database.

| Column          | Datatype       | NULL     | Description                                                                                                                                               |
|-----------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128) | NOT NULL | Owner of the queue                                                                                                                                        |
| NAME            | VARCHAR2 (128) | NOT NULL | Name of the queue                                                                                                                                         |
| QUEUE_TABLE     | VARCHAR2 (128) | NOT NULL | Name of the table in which the queue data resides                                                                                                         |
| QID             | NUMBER         | NOT NULL | Object number of the queue                                                                                                                                |
| QUEUE_TYPE      | VARCHAR2 (20)  |          | Type of the queue. Possible values: <ul style="list-style-type: none"> <li>• <code>EXCEPTION_QUEUE</code></li> <li>• <code>NORMAL_QUEUE</code></li> </ul> |
| MAX_RETRIES     | NUMBER         |          | Maximum number of retries allowed when dequeuing from the queue                                                                                           |
| RETRY_DELAY     | NUMBER         |          | Time interval between retries                                                                                                                             |
| ENQUEUE_ENABLED | VARCHAR2 (7)   |          | Indicates whether the queue is enabled for enqueue ( <code>YES</code> ) or not ( <code>NO</code> )                                                        |
| DEQUEUE_ENABLED | VARCHAR2 (7)   |          | Indicates whether the queue is enabled for dequeue ( <code>YES</code> ) or not ( <code>NO</code> )                                                        |
| RETENTION       | VARCHAR2 (40)  |          | Time interval that processed messages are retained in the queue, or <code>FOREVER</code>                                                                  |
| USER_COMMENT    | VARCHAR2 (50)  |          | User-specified comment                                                                                                                                    |
| NETWORK_NAME    | VARCHAR2 (512) |          | Network name of the queue service                                                                                                                         |
| SHARDED         | VARCHAR2 (5)   |          | <code>TRUE</code> if the queue is sharded, <code>FALSE</code> otherwise                                                                                   |

| Column         | Datatype      | NULL | Description                                                                                                                                                      |
|----------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_CATEGORY | VARCHAR2 (25) |      | Queue category. Possible values: <ul style="list-style-type: none"> <li>• Classic Queue</li> <li>• Sharded Queue</li> <li>• Transactional Event Queue</li> </ul> |
| RECIPIENTS     | VARCHAR2 (8)  |      | SINGLE or MULTIPLE recipients                                                                                                                                    |

## 3.175 ALL\_DIM\_ATTRIBUTES

ALL\_DIM\_ATTRIBUTES describes the relationship between a dimension level and a functionally dependent column. The level columns and the dependent column must be in the same table.

### Related Views

- DBA\_DIM\_ATTRIBUTES describes all such dimension relationships in the database.
- USER\_DIM\_ATTRIBUTES describes all such dimension attributes in the current user's schema.

| Column         | Datatype       | NULL     | Description                                                                              |
|----------------|----------------|----------|------------------------------------------------------------------------------------------|
| OWNER          | VARCHAR2 (128) | NOT NULL | Owner of the dimension                                                                   |
| DIMENSION_NAME | VARCHAR2 (128) | NOT NULL | Name of the dimension                                                                    |
| ATTRIBUTE_NAME | VARCHAR2 (128) |          | Name of the attribute                                                                    |
| LEVEL_NAME     | VARCHAR2 (128) |          | Name of the hierarchy level                                                              |
| COLUMN_NAME    | VARCHAR2 (128) | NOT NULL | Dependent column name                                                                    |
| INFERRED       | CHAR (1)       |          | Indicates whether the attribute is inferred from a JOIN KEY specification (Y) or not (N) |

## 3.176 ALL\_DIM\_CHILD\_OF

ALL\_DIM\_CHILD\_OF describes hierarchical relationships of 1 to  $n$  between the pairs of levels in the dimensions accessible to the current user.

### Related Views

- DBA\_DIM\_CHILD\_OF describes all such hierarchical relationships in the database.
- USER\_DIM\_CHILD\_OF describes all such hierarchical attributes in the current user's schema.

| Column | Datatype       | NULL     | Description            |
|--------|----------------|----------|------------------------|
| OWNER  | VARCHAR2 (128) | NOT NULL | Owner of the dimension |

| Column            | Datatype       | NULL     | Description                                                                     |
|-------------------|----------------|----------|---------------------------------------------------------------------------------|
| DIMENSION_NAME    | VARCHAR2 (128) | NOT NULL | Name of the dimension                                                           |
| HIERARCHY_NAME    | VARCHAR2 (128) |          | Hierarchy name                                                                  |
| POSITION          | NUMBER         | NOT NULL | Hierarchical position within this hierarchy, position 1 being the most detailed |
| CHILD_LEVEL_NAME  | VARCHAR2 (128) |          | Child side of 1:n relationship                                                  |
| JOIN_KEY_ID       | VARCHAR2 (40)  |          | If non-null, then the child joins to the parent                                 |
| PARENT_LEVEL_NAME | VARCHAR2 (128) |          | Parent side of 1:n relationship in relation to the CHILD_LEVEL_NAME             |

## 3.177 ALL\_DIM\_HIERARCHIES

ALL\_DIM\_HIERARCHIES describes all dimension hierarchies accessible to the current user.

**Related Views**

- DBA\_DIM\_HIERARCHIES describes all such hierarchies in the database.
- USER\_DIM\_HIERARCHIES describes all such hierarchies owned by the current user.

| Column         | Datatype       | NULL     | Description            |
|----------------|----------------|----------|------------------------|
| OWNER          | VARCHAR2 (128) | NOT NULL | Owner of the dimension |
| DIMENSION_NAME | VARCHAR2 (128) | NOT NULL | Name of the dimension  |
| HIERARCHY_NAME | VARCHAR2 (128) |          | Hierarchy name         |

**See Also:**

- ["DBA\\_DIM\\_HIERARCHIES"](#)
- ["USER\\_DIM\\_HIERARCHIES"](#)

## 3.178 ALL\_DIM\_JOIN\_KEY

ALL\_DIM\_JOIN\_KEY describes the joins between two dimension tables that are accessible to the current user. The join is always specified between a parent dimension level column and a child column.

### Related Views

- DBA\_DIM\_JOIN\_KEY describes all such joins in the database.
- USER\_DIM\_JOIN\_KEY describes all such joins owned by the current user.

| Column            | Datatype       | NULL     | Description                                         |
|-------------------|----------------|----------|-----------------------------------------------------|
| OWNER             | VARCHAR2 (128) | NOT NULL | Owner of the dimension                              |
| DIMENSION_NAME    | VARCHAR2 (128) | NOT NULL | Name of the dimension                               |
| DIM_KEY_ID        | NUMBER         | NOT NULL | Join key ID (unique within a dimension)             |
| LEVEL_NAME        | VARCHAR2 (128) |          | Name of the hierarchy level                         |
| KEY_POSITION      | NUMBER         | NOT NULL | Ordinal position of the key column within the level |
| HIERARCHY_NAME    | VARCHAR2 (128) |          | Name of the hierarchy                               |
| CHILD_JOIN_OWNER  | VARCHAR2 (128) | NOT NULL | Owner of the join column table                      |
| CHILD_JOIN_TABLE  | VARCHAR2 (128) | NOT NULL | Name of the join column table                       |
| CHILD_JOIN_COLUMN | VARCHAR2 (128) | NOT NULL | Name of the join column                             |
| CHILD_LEVEL_NAME  | VARCHAR2 (128) |          | Name of the child hierarchy level of the join key   |

## 3.179 ALL\_DIM\_LEVEL\_KEY

ALL\_DIM\_LEVEL\_KEY describes a column of a dimension level accessible to the current user. The position of a column within a level is specified by KEY\_POSITION.

### Related Views

- DBA\_DIM\_LEVEL\_KEY describes all columns of dimension levels in the database.
- USER\_DIM\_LEVEL\_KEY describes all columns of dimension levels owned by the current user.

| Column         | Datatype       | NULL     | Description                                         |
|----------------|----------------|----------|-----------------------------------------------------|
| OWNER          | VARCHAR2 (128) | NOT NULL | Owner of the dimension                              |
| DIMENSION_NAME | VARCHAR2 (128) | NOT NULL | Name of the dimension                               |
| LEVEL_NAME     | VARCHAR2 (128) |          | Name of the hierarchy level                         |
| KEY_POSITION   | NUMBER         | NOT NULL | Ordinal position of the key column within the level |

| Column      | Datatype       | NULL     | Description            |
|-------------|----------------|----------|------------------------|
| COLUMN_NAME | VARCHAR2 (128) | NOT NULL | Name of the key column |

## 3.180 ALL\_DIM\_LEVELS

ALL\_DIM\_LEVELS describes the dimension levels accessible to the current user. All columns of a dimension level must come from the same relation.

**Related Views**

- DBA\_DIM\_LEVELS describes all dimension levels in the database.
- USER\_DIM\_LEVELS describes the levels of all dimensions owned by the current user.

| Column          | Datatype       | NULL     | Description                                                                           |
|-----------------|----------------|----------|---------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128) | NOT NULL | Owner of the dimension                                                                |
| DIMENSION_NAME  | VARCHAR2 (128) | NOT NULL | Name of the dimension                                                                 |
| LEVEL_NAME      | VARCHAR2 (128) |          | Unique within a dimension                                                             |
| NUM_COLUMNS     | NUMBER         |          | Number of columns in the level definition                                             |
| DETAILOBJ_OWNER | VARCHAR2 (128) | NOT NULL | Owner of the detail object that the keys of this level come from                      |
| DETAILOBJ_NAME  | VARCHAR2 (128) | NOT NULL | Name of the table that the keys of this level come from                               |
| SKIP_WHEN_NULL  | VARCHAR2 (1)   |          | Indicates whether the level is declared with the SKIP WHEN NULL clause (Y) or not (N) |

**See Also:**

- "DBA\_DIM\_LEVELS"
- "USER\_DIM\_LEVELS"

## 3.181 ALL\_DIMENSIONS

ALL\_DIMENSIONS describes the dimension objects accessible to the current user.

**Related Views**

- DBA\_DIMENSIONS describes all dimensions in the database.
- USER\_DIMENSIONS describes the dimensions in the current user's schema.

| Column         | Datatype       | NULL     | Description                                                                                                                        |
|----------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------|
| OWNER          | VARCHAR2 (128) | NOT NULL | Owner of the dimension                                                                                                             |
| DIMENSION_NAME | VARCHAR2 (128) | NOT NULL | Name of the dimension                                                                                                              |
| INVALID        | VARCHAR2 (1)   |          | Indicates whether the dimension is invalid (Y) or valid (N)                                                                        |
| COMPILE_STATE  | VARCHAR2 (13)  |          | Compile status of the dimension: <ul style="list-style-type: none"><li>• INVALID</li><li>• NEEDS_COMPILE</li><li>• ERROR</li></ul> |
| REVISION       | NUMBER         |          | Dimension revision level                                                                                                           |

**See Also:**

## 3.183 ALL\_DOMAIN\_COLS

ALL\_DOMAIN\_COLS describes columns of the data use case domains accessible to the current user.

This view displays use case domain column attributes. Use case domain columns with alternative data types are displayed for each possible data type.

### Related Views

- DBA\_DOMAIN\_COLS describes columns of all data use case domains in the database.
- USER\_DOMAIN\_COLS describes columns of the data use case domains owned by the current user.

| Column               | Datatype       | NULL     | Description                                                                                                                                               |
|----------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER                | VARCHAR2 (128) | NOT NULL | Owner of the use case domain                                                                                                                              |
| DOMAIN_NAME          | VARCHAR2 (128) | NOT NULL | Name of the use case domain                                                                                                                               |
| COLUMN_NAME          | VARCHAR2 (128) | NOT NULL | Name of the column                                                                                                                                        |
| COLUMN_ID            | NUMBER         | NOT NULL | Column number in the use case domain                                                                                                                      |
| DATA_TYPE_ID         | NUMBER         | NOT NULL | Indicates whether this row represents the primary (1) or secondary (2) data type specification for the column                                             |
| DATA_TYPE            | VARCHAR2 (106) |          | Data type of the column                                                                                                                                   |
| DATA_LENGTH          | NUMBER         |          | Length of the column (in bytes)                                                                                                                           |
| DATA_PRECISION       | NUMBER         |          | Decimal precision for NUMBER data type; binary precision for FLOAT data type; null for all other data types                                               |
| DATA_SCALE           | NUMBER         |          | Digits to the right of the decimal point in a number; null for all other data types                                                                       |
| NULLABLE             | VARCHAR2 (1)   |          | Indicates whether a column allows NULLS. The value is N if there is a NOT NULL constraint on the column.                                                  |
| DATA_DEFAULT         | CLOB           |          | Default value for the column                                                                                                                              |
| DEFAULT_LENGTH       | NUMBER         |          | Length of the default value for the column (in bytes)                                                                                                     |
| DEFAULT_ON_NULL      | VARCHAR2 (3)   |          | Indicates whether the column has DEFAULT ON NULL for INSERT semantics (YES) or not (NO)                                                                   |
| DEFAULT_ON_NULL_UPD  | VARCHAR2 (3)   |          | Indicates whether the column has DEFAULT ON NULL for UPDATE semantics (YES) or not (NO)                                                                   |
| CHARACTER_SET_NAME   | VARCHAR2 (44)  |          | For character type columns, the name of the character set for the column: <ul style="list-style-type: none"> <li>• CHAR_CS</li> <li>• NCHAR_CS</li> </ul> |
| CHAR_COL_DECL_LENGTH | NUMBER         |          | For character type columns, the declared length of the column (in bytes)                                                                                  |
| COLLATION            | VARCHAR2 (100) |          | For character type columns, the collation for the column<br>If a collation was not specified, the value of this column is null.                           |
| EXACT                | BOOLEAN        |          | Indicates whether the column data type specification is strict (TRUE) or not (FALSE)                                                                      |

| Column       | Datatype | NULL | Description                                                                                                                    |
|--------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------|
| CHAR_LENGTH  | NUMBER   |      | For character type columns, the length of the column (in characters)                                                           |
| DISCRIMINANT | BOOLEAN  |      | Indicates whether the column is a discriminant column in a flexible domain ( <code>TRUE</code> ) or not ( <code>FALSE</code> ) |

## 3.184 ALL\_DOMAIN\_CONSTRAINTS

`ALL_DOMAIN_CONSTRAINTS` describes constraint definitions in the data use case domains accessible to the current user.

### Related Views

- `DBA_DOMAIN_CONSTRAINTS` describes constraint definitions in all data use case domains in the database.
- `USER_DOMAIN_CONSTRAINTS` describes constraint definitions in the data use case domains owned by the current user.

| Column           | Datatype      | NULL     | Description                                                                                                                                                                             |
|------------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME             | VARCHAR2(128) | NOT NULL | Name of the constraint definition                                                                                                                                                       |
| DOMAIN_OWNER     | VARCHAR2(128) | NOT NULL | Owner of the use case domain in which the constraint is defined                                                                                                                         |
| DOMAIN_NAME      | VARCHAR2(128) | NOT NULL | Name of the use case domain in which the constraint is defined                                                                                                                          |
| CONSTRAINT_TYPE  | VARCHAR2(1)   |          | Type of the constraint definition<br>The value of this column is always <code>C</code> , which means the constraint is either a check constraint or a <code>NOT NULL</code> constraint. |
| SEARCH_CONDITION | CLOB          |          | Text of the search condition for a check constraint                                                                                                                                     |
| STATUS           | VARCHAR2(8)   |          | Enforcement status of the constraint: <ul style="list-style-type: none"><li>• <code>ENABLED</code></li><li>• <code>DISABLED</code></li></ul>                                            |

| Column     | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 3.192 ALL\_ENCRYPTED\_COLUMNS

ALL\_ENCRYPTED\_COLUMNS displays encryption algorithm information for the encrypted columns in the tables accessible to the current user.

### Related Views

- DBA\_ENCRYPTED\_COLUMNS displays encryption algorithm information for all encrypted columns in the database.
- USER\_ENCRYPTED\_COLUMNS displays encryption algorithm information for the encrypted columns in the tables owned by the current user. This view does not display the OWNER column.

| Column         | Datatype       | NULL     | Description                                                                                                                                                                                                                           |
|----------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER          | VARCHAR2 (128) | NOT NULL | Owner of the table                                                                                                                                                                                                                    |
| TABLE_NAME     | VARCHAR2 (128) | NOT NULL | Name of the table                                                                                                                                                                                                                     |
| COLUMN_NAME    | VARCHAR2 (128) | NOT NULL | Name of the column                                                                                                                                                                                                                    |
| ENCRYPTION_ALG | VARCHAR2 (29)  |          | Encryption algorithm used to protect secrecy of data in this column: <ul style="list-style-type: none"><li>• 3 Key Triple DES 168 bits key</li><li>• AES 128 bits key</li><li>• AES 192 bits key</li><li>• AES 256 bits key</li></ul> |
| SALT           | VARCHAR2 (3)   |          | Indicates whether the column is encrypted with SALT (YES) or not (NO)                                                                                                                                                                 |
| INTEGRITY_ALG  | VARCHAR2 (12)  |          | Integrity algorithm used for the column: <ul style="list-style-type: none"><li>• SHA-1</li><li>• NOMAC</li></ul>                                                                                                                      |

## 3.193 ALL\_ERROR\_TRANSLATIONS

ALL\_ERROR\_TRANSLATIONS describes all error translations accessible to the user.

### Related Views

- DBA\_ERROR\_TRANSLATIONS describes all error translations in the database.
- USER\_ERROR\_TRANSLATIONS describes all error translations owned by the user. This view does not display the OWNER column.

| Column              | Datatype        | NULL     | Description                                          |
|---------------------|-----------------|----------|------------------------------------------------------|
| OWNER               | VARCHAR2 (128)  | NOT NULL | Owner of the SQL translation profile                 |
| PROFILE_NAME        | VARCHAR2 (128)  | NOT NULL | Name of the SQL translation profile                  |
| ERROR_CODE          | NUMBER          | NOT NULL | The Oracle error code                                |
| TRANSLATED_CODE     | NUMBER          |          | The translated error code                            |
| TRANSLATED_SQLSTATE | VARCHAR2 (5)    |          | The translated SQLSTATE                              |
| ENABLED             | VARCHAR2 (5)    |          | TRUE if the translation is enabled, FALSE otherwise. |
| REGISTRATION_TIME   | TIMESTAMP (6)   |          | Time the translation was registered                  |
| COMMENTS            | VARCHAR2 (4000) |          | Comment on the translation                           |

## 3.194 ALL\_ERRORS

ALL\_ERRORS describes the current errors on the stored objects accessible to the current user.

**Related Views**

- DBA\_ERRORS describes the current errors on all stored objects in the database.
- USER\_ERRORS describes the current errors on the stored objects owned by the current user. This view does not display the OWNER column.

| Column   | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                      |
|----------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER    | VARCHAR2 (128) | NOT NULL | Owner of the object                                                                                                                                                                                                                                                                              |
| NAME     | VARCHAR2 (128) | NOT NULL | Name of the object                                                                                                                                                                                                                                                                               |
| TYPE     | VARCHAR2 (12)  |          | Type of the object: <ul style="list-style-type: none"><li>• VIEW</li><li>• PROCEDURE</li><li>• FUNCTION</li><li>• PACKAGE</li><li>• PACKAGE BODY</li><li>• TRIGGER</li><li>• TYPE</li><li>• TYPE BODY</li><li>• LIBRARY</li><li>• JAVA SOURCE</li><li>• JAVA CLASS</li><li>• DIMENSION</li></ul> |
| SEQUENCE | NUMBER         | NOT NULL | Sequence number (for ordering purposes)                                                                                                                                                                                                                                                          |
| LINE     | NUMBER         | NOT NULL | Line number at which the error occurred                                                                                                                                                                                                                                                          |
| POSITION | NUMBER         | NOT NULL | Position in the line at which the error occurred                                                                                                                                                                                                                                                 |

| Column         | Datatype        | NULL     | Description                                                            |
|----------------|-----------------|----------|------------------------------------------------------------------------|
| TEXT           | VARCHAR2 (4000) | NOT NULL | Text of the error                                                      |
| ATTRIBUTE      | VARCHAR2 (9)    |          | Indicates whether the error is an error (ERROR) or a warning (WARNING) |
| MESSAGE_NUMBER | NUMBER          |          | Numeric error number (without any prefix)                              |

## 3.196 ALL\_EVALUATION\_CONTEXT\_TABLES

ALL\_EVALUATION\_CONTEXT\_TABLES describes the tables in the rule evaluation contexts accessible to the current user.

**Related Views**

- DBA\_EVALUATION\_CONTEXT\_TABLES describes the tables in all rule evaluation contexts in the database.
- USER\_EVALUATION\_CONTEXT\_TABLES describes the tables in the rule evaluation contexts owned by the current user. This view does not display the EVALUATION\_CONTEXT\_OWNER column.

| Column                   | Datatype        | NULL     | Description                                      |
|--------------------------|-----------------|----------|--------------------------------------------------|
| EVALUATION_CONTEXT_OWNER | VARCHAR2 (128)  | NOT NULL | Owner of the evaluation context                  |
| EVALUATION_CONTEXT_NAME  | VARCHAR2 (128)  | NOT NULL | Name of the evaluation context                   |
| TABLE_ALIAS              | VARCHAR2 (128)  |          | Alias for a table in the evaluation context      |
| TABLE_NAME               | VARCHAR2 (4000) |          | Name of the table referred to by the table alias |

## 3.197 ALL\_EVALUATION\_CONTEXT\_VARS

ALL\_EVALUATION\_CONTEXT\_VARS describes the variables in the rule evaluation contexts accessible to the current user.

**Related Views**

- DBA\_EVALUATION\_CONTEXT\_VARS describes the variables in all rule evaluation contexts in the database.

- `USER_EVALUATION_CONTEXT_VARS` describes the variables in the rule evaluation contexts owned by the current user. This view does not display the `EVALUATION_CONTEXT_OWNER` column.

| Column                                | Datatype                    | NULL     | Description                                                                                                                                                                                |
|---------------------------------------|-----------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>EVALUATION_CONTEXT_OWNER</code> | <code>VARCHAR2(128)</code>  | NOT NULL | Owner of the evaluation context                                                                                                                                                            |
| <code>EVALUATION_CONTEXT_NAME</code>  | <code>VARCHAR2(128)</code>  | NOT NULL | Name of the evaluation context                                                                                                                                                             |
| <code>VARIABLE_NAME</code>            | <code>VARCHAR2(128)</code>  |          | Name of a variable in the evaluation context                                                                                                                                               |
| <code>VARIABLE_TYPE</code>            | <code>VARCHAR2(4000)</code> |          | Datatype of the variable                                                                                                                                                                   |
| <code>VARIABLE_VALUE_FUNCTION</code>  | <code>VARCHAR2(4000)</code> |          | Function used to retrieve the value of the variable; NULL for variables that are not implicit                                                                                              |
| <code>VARIABLE_METHOD_FUNCTION</code> | <code>VARCHAR2(228)</code>  |          | Function used to retrieve the result of method invocation on the variable. Such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. |

| TABLE_OWNER            | VARCHAR2 (128) | NOT NULL | Owner of the table                                                                                                                                                              |
| TABLE_NAME             | VARCHAR2 (128) | NOT NULL | Table name                                                                                                                                                                      |
| RESOLUTION_GRANULARITY | VARCHAR2 (6)   |          | Resolution granularity: <ul style="list-style-type: none"><li>• ROW</li><li>• COLUMN</li></ul>                                                                                  |
| FETCHCOLS              | VARCHAR2 (3)   |          | Extract fetchcols configuration: <ul style="list-style-type: none"><li>• Yes: Extract will fetch non-scalar data</li><li>• No: Extract will not fetch non-scalar data</li></ul> |
| RECORD_CONFLICTS       | VARCHAR2 (3)   |          | Monitoring of conflicts: <ul style="list-style-type: none"><li>• Yes: Conflict info is recorded</li><li>• No: Conflict info is not recorded</li></ul>                           |
| USE_CUSTOM_HANDLERS    | VARCHAR2 (4)   |          | Use of customized or automatic conflict handlers: <ul style="list-style-type: none"><li>• All: If using custom handlers</li><li>• None: If using automatic handlers</li></ul>   |

| Column                  | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROW_RESOLUTION_METHOD   | VARCHAR2 (18)  |          | Indicates which row-level conflict resolution method to use when the old value of the logical change record (LCR) timestamp column is different from the timestamp column value in the table. Possible values: <ul style="list-style-type: none"> <li>• <b>EARLIEST_TIMESTAMP</b>: The conflict will be resolved in favor of the LCR when the new value of the LCR timestamp column is <i>less than</i> the timestamp column value in the table</li> <li>• <b>LATEST_TIMESTAMP</b>: The conflict will be resolved in favor of the LCR when the new value of the LCR timestamp column is <i>greater than</i> the timestamp column value in the table</li> </ul> |
| DELETE_ALWAYS_WINS      | VARCHAR2 (3)   |          | When a conflict occurs between a delete operation and another operation, a <b>YES</b> value indicates that the delete operation succeeds and the other operation is discarded, and a <b>NO</b> value indicates that there is no special preference for the delete operation                                                                                                                                                                                                                                                                                                                                                                                    |
| IGNORE_SITE_PRIORITY    | VARCHAR2 (3)   |          | When a conflict occurs between a target table change and a source table change, and <b>SITE_PRIORITY</b> has been specified, this value indicates whether <b>SITE_PRIORITY</b> should be ignored ( <b>YES</b> ) or not ( <b>NO</b> )                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TOMBSTONE_TABLE         | VARCHAR2 (128) |          | Tombstone table name (if table has delete tombstoning enabled)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ROW_RESOLUTION_COLUMN   | VARCHAR2 (128) | NOT NULL | Name of row-level timestamp column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| KEY_VERSION_COLUMN      | VARCHAR2 (8)   |          | Indicates whether the table contains a hidden column named <b>KEYVER\$\$</b> , which contains a version timestamp<br>Possible values: <ul style="list-style-type: none"> <li>• <b>KEYVER\$\$</b> - The table contains a <b>KEYVER\$\$</b> column</li> <li>• <b>NONE</b> - The table does not contain a <b>KEYVER\$\$</b> column</li> </ul>                                                                                                                                                                                                                                                                                                                     |
| EXISTING_DATA_TIMESTAMP | TIMESTAMP (6)  |          | Timestamp to give existing rows when a new timestamp column is added                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 3.209 ALL\_HEAT\_MAP\_SEG\_HISTOGRAM

ALL\_HEAT\_MAP\_SEG\_HISTOGRAM displays segment access information for all segments visible to the user.

### Related Views

- DBA\_HEAT\_MAP\_SEG\_HISTOGRAM displays segment access information for all segments.
- USER\_HEAT\_MAP\_SEG\_HISTOGRAM displays segment access information for segments owned by the user. This view does not display the OWNER column.

| Column         | Datatype       | NULL     | Description                                                   |
|----------------|----------------|----------|---------------------------------------------------------------|
| OWNER          | VARCHAR2 (128) | NOT NULL | Table owner                                                   |
| OBJECT_NAME    | VARCHAR2 (128) | NOT NULL | Name of the object                                            |
| SUBOBJECT_NAME | VARCHAR2 (128) |          | Name of the sub-object                                        |
| TRACK_TIME     | DATE           |          | System time when the segment access was tracked               |
| SEGMENT_WRITE  | VARCHAR2 (3)   |          | Indicates whether the segment has write access (YES or NO)    |
| FULL_SCAN      | VARCHAR2 (3)   |          | Indicates whether the segment has full table scan (YES or NO) |
| LOOKUP_SCAN    | VARCHAR2 (3)   |          | Indicates whether the segment has lookup scan (YES or NO)     |

## 3.210 ALL\_HEAT\_MAP\_SEGMENT

ALL\_HEAT\_MAP\_SEGMENT displays the latest segment access time for all segments visible to the user. The timestamps in the view are coarse with a granularity of a day reflecting the flush times of the heat map.

### Related Views

- DBA\_HEAT\_MAP\_SEGMENT displays the latest segment access time for all segments.
- USER\_HEAT\_MAP\_SEGMENT displays the latest segment access time for all segments owned by the user. This view does not display the OWNER column.

| Column             | Datatype       | NULL     | Description                                               |
|--------------------|----------------|----------|-----------------------------------------------------------|
| OWNER              | VARCHAR2 (128) | NOT NULL | Table owner                                               |
| OBJECT_NAME        | VARCHAR2 (128) | NOT NULL | Name of the object                                        |
| SUBOBJECT_NAME     | VARCHAR2 (128) |          | Name of the sub-object                                    |
| SEGMENT_WRITE_TIME | DATE           |          | Latest timestamp on which the segment has write access    |
| SEGMENT_READ_TIME  | DATE           |          | Latest timestamp on which the segment has read access     |
| FULL_SCAN          | DATE           |          | Latest timestamp on which the segment has full table scan |
| LOOKUP_SCAN        | DATE           |          | Latest timestamp on which the segment has index scan      |

| Column               | Datatype       | NULL     | Description                                                                                                                                                                                                                                                           |
|----------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER                | VARCHAR2 (128) | NOT NULL | Owner of the hierarchy                                                                                                                                                                                                                                                |
| HIER_NAME            | VARCHAR2 (128) | NOT NULL | Name of the hierarchy                                                                                                                                                                                                                                                 |
| COLUMN_NAME          | VARCHAR2 (128) | NOT NULL | Name of the column                                                                                                                                                                                                                                                    |
| ROLE                 | VARCHAR2 (4)   |          | The role the attribute plays in the hierarchy: <ul style="list-style-type: none"> <li>• KEY</li> <li>• AKEY</li> <li>• HIER</li> <li>• PROP</li> </ul>                                                                                                                |
| DATA_TYPE            | VARCHAR2 (106) |          | Datatype of the column                                                                                                                                                                                                                                                |
| DATA_LENGTH          | NUMBER         | NOT NULL | Length of the column (in bytes)                                                                                                                                                                                                                                       |
| DATA_PRECISION       | NUMBER         |          | Decimal precision for the NUMBER datatype; binary precision for the FLOAT datatype, NULL for all other datatypes                                                                                                                                                      |
| DATA_SCALE           | NUMBER         |          | Number of digits to the right of the decimal point in a number                                                                                                                                                                                                        |
| NULLABLE             | CHAR (1)       |          | Indicates whether a column allows NULL values; the value is N if there is a NOT NULL constraint on the column or if the column is part of a PRIMARY KEY                                                                                                               |
| CHARACTER_SET_NAME   | VARCHAR2 (44)  |          | Name of the character set: <ul style="list-style-type: none"> <li>• CHAR_CS</li> <li>• NCHAR_CS</li> </ul>                                                                                                                                                            |
| CHAR_COL_DECL_LENGTH | NUMBER         |          | Declaration length of the character type column                                                                                                                                                                                                                       |
| CHAR_USED            | VARCHAR2 (1)   |          | Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C), or whether the datatype is not any of the following (NULL): <ul style="list-style-type: none"> <li>• CHAR</li> <li>• VARCHAR2</li> <li>• NCHAR</li> <li>• NVARCHAR2</li> </ul> |
| ORDER_NUM            | NUMBER         | NOT NULL | Order of the column, with attributes first in the order specified in the definition of the hierarchy followed by hierarchical attributes                                                                                                                              |

| Column        | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORIGIN_CON_ID | NUMBER         |      | The ID of the container where the data originates. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows in non-CDBs. This value is not used for CDBs.</li> <li><i>n</i>: This value is used for rows containing data that originate in the container with container ID <i>n</i> (<i>n</i> = 1 if the row originates in root).</li> </ul> |
| EDITION_NAME  | VARCHAR2 (128) |      | Name of the application edition where the hierarchy is defined                                                                                                                                                                                                                                                                                                                     |

## 3.227 ALL\_HIST\_SAGAS

ALL\_HIST\_SAGAS provides a history of the completed sagas accessible to the current user.

This view displays sagas that were either initiated in the current PDB or joined by participants in the current PDB.

Completed sagas are retained in this view for the length of time specified by the SAGA\_HIST\_RETENTION initialization parameter. The default is 30 days.

#### Related Views

- DBA\_HIST\_SAGAS provides a history of all completed sagas in the database.
- USER\_HIST\_SAGAS provides a history of the completed sagas owned by the current user. This view does not display the OWNER column.

| Column           | Datatype       | NULL     | Description                                                                                                |

## 3.229 ALL\_HIVE\_COLUMNS

ALL\_HIVE\_COLUMNS describes all Hive columns accessible to the current user in a Hive metastore.

### Related Views

- DBA\_HIVE\_COLUMNS describes all Hive columns in a Hive metastore.
- USER\_HIVE\_COLUMNS describes all Hive columns owned by the current user in a Hive metastore.

| Column             | Datatype        | NULL | Description                                                            |
|--------------------|-----------------|------|------------------------------------------------------------------------|
| CLUSTER_ID         | VARCHAR2 (4000) |      | Identifier for the Hadoop cluster                                      |
| DATABASE_NAME      | VARCHAR2 (4000) |      | Hive database where the owning Hive table resides                      |
| TABLE_NAME         | VARCHAR2 (4000) |      | Hive table name that the column belongs to                             |
| COLUMN_NAME        | VARCHAR2 (4000) |      | Hive column name                                                       |
| HIVE_COLUMN_TYPE   | VARCHAR2 (4000) |      | Data type of the Hive column                                           |
| ORACLE_COLUMN_TYPE | VARCHAR2 (4000) |      | Equivalent Oracle data type of the Hive column                         |
| LOCATION           | VARCHAR2 (4000) |      | Physical location of the Hive table                                    |
| OWNER              | VARCHAR2 (4000) |      | Owner of the Hive table                                                |
| CREATION_TIME      | DATE            |      | Time that the Hive column was created                                  |
| HIVE_URI           | VARCHAR2 (4000) |      | The connection string (URI and port number) for the metastore database |

## 3.231 ALL\_HIVE\_PART\_KEY\_COLUMNS

ALL\_HIVE\_PART\_KEY\_COLUMNS provides information about all Hive table partition columns accessible to the current user in the database.

**Related Views**

- DBA\_HIVE\_PART\_KEY\_COLUMNS provides information about all Hive table partition columns in the database.
- USER\_HIVE\_PART\_KEY\_COLUMNS provides information about all Hive table partition columns owned by the current user in the database.

| Column             | Datatype        | NULL | Description                                                   |
|--------------------|-----------------|------|---------------------------------------------------------------|
| CLUSTER_ID         | VARCHAR2 (4000) |      | Hadoop cluster name                                           |
| DATABASE_NAME      | VARCHAR2 (4000) |      | Hive database where the Hive table resides                    |
| TABLE_NAME         | VARCHAR2 (4000) |      | Hive table name                                               |
| OWNER              | VARCHAR2 (4000) |      | Owner of the Hive table                                       |
| COLUMN_NAME        | VARCHAR2 (4000) |      | Partition column name                                         |
| COLUMN_TYPE        | VARCHAR2 (4000) |      | Partition column type                                         |
| COLUMN_POSITION    | NUMBER          |      | Partition column position in the Hive partition specification |
| ORACLE_COLUMN_TYPE | VARCHAR2 (4000) |      | Equivalent Oracle data type of the Hive column                |

## 3.232 ALL\_HIVE\_TAB\_PARTITIONS

ALL\_HIVE\_TAB\_PARTITIONS provides information about all Hive table partitions accessible to the current user in the database.

### Related Views

- DBA\_HIVE\_TAB\_PARTITIONS provides information about all Hive table partitions in the database.
- USER\_HIVE\_TAB\_PARTITIONS provides information about all Hive table partitions owned by the current user in the database.

| Column          | Datatype        | NULL | Description                                |
|-----------------|-----------------|------|--------------------------------------------|
| CLUSTER_ID      | VARCHAR2 (4000) |      | Hadoop cluster name                        |
| DATABASE_NAME   | VARCHAR2 (4000) |      | Hive database where the Hive table resides |
| TABLE_NAME      | VARCHAR2 (4000) |      | Hive table name                            |
| LOCATION        | VARCHAR2 (4000) |      | Physical location of the Hive partition    |
| OWNER           | VARCHAR2 (4000) |      | Owner of the Hive table                    |
| PARTITION_SPECS | VARCHAR2 (4000) |      | The current Hive partition specification   |
| PART_SIZE       | NUMBER          |      | Partition size in bytes                    |
| CREATION_TIME   | DATE            |      | Time that the partition was created        |

## 3.233 ALL\_HIVE\_TABLES

ALL\_HIVE\_TABLES provides information about all the Hive tables accessible to the current user in the Hive metastore.

### Related Views

- DBA\_HIVE\_TABLES provides information about all Hive tables in the Hive metastore.
- USER\_HIVE\_TABLES provides information about all Hive tables owned by the current user in the Hive metastore.

| Column        | Datatype        | NULL | Description                                |
|---------------|-----------------|------|--------------------------------------------|
| CLUSTER_ID    | VARCHAR2 (4000) |      | Hadoop cluster name                        |
| DATABASE_NAME | VARCHAR2 (4000) |      | Hive database where the Hive table resides |
| TABLE_NAME    | VARCHAR2 (4000) |      | Hive table name                            |
| LOCATION      | VARCHAR2 (4000) |      | Physical location of the Hive table        |
| NO_OF_COLS    | NUMBER          |      | Number of columns in the Hive table        |

| Column             | Datatype        | NULL | Description                                                            |
|--------------------|-----------------|------|------------------------------------------------------------------------|
| CREATION_TIME      | DATE            |      | Creation time of the Hive table                                        |
| LAST_ACCESSED_TIME | DATE            |      | Time that the Hive table was last accessed                             |
| OWNER              | VARCHAR2 (4000) |      | Owner of the Hive table                                                |
| TABLE_TYPE         | VARCHAR2 (4000) |      | Type of the Hive table                                                 |
| PARTITIONED        | VARCHAR2 (4000) |      | Is this Hive table partitioned?                                        |
| NO_OF_PART_KEYS    | NUMBER          |      | Number of partition keys in the Hive table                             |
| INPUT_FORMAT       | VARCHAR2 (4000) |      | Hive table input format                                                |
| OUTPUT_FORMAT      | VARCHAR2 (4000) |      | Hive table output format                                               |
| SERIALIZATION      | VARCHAR2 (4000) |      | Hive table serialization                                               |
| COMPRESSED         | NUMBER          |      | Is this Hive table compressed?                                         |
| HIVE_URI           | VARCHAR2 (4000) |      | The connection string (URI and port number) for the metastore database |

## 3.234 ALL\_IDENTIFIERS

ALL\_IDENTIFIERS displays information about the identifiers in the stored objects accessible to the current user.

**Related Views**

- DBA\_IDENTIFIERS displays information about the identifiers in all stored objects in the database.
- USER\_IDENTIFIERS displays information about the identifiers in the stored objects owned by the current user. This view does not display the OWNER column.

| Column    | Datatype       | NULL     | Description                 |
|-----------|----------------|----------|-----------------------------|
| OWNER     | VARCHAR2 (128) | NOT NULL | Owner of the identifier     |
| NAME      | VARCHAR2 (128) |          | Name of the identifier      |
| SIGNATURE | VARCHAR2 (32)  |          | Signature of the identifier |

| Column           | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE             | VARCHAR2 (18)  |          | Type of the identifier.<br>For SQL identifiers, the types include: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• VIEW</li> <li>• SEQUENCE</li> <li>• ALIAS</li> <li>• COLUMN</li> <li>• MATERIALIZED VIEW</li> <li>• OPERATOR</li> </ul> For PL/SQL identifiers, the types include: <ul style="list-style-type: none"> <li>• FUNCTION</li> <li>• PROCEDURE</li> <li>• PACKAGE</li> </ul> |
| OBJECT_NAME      | VARCHAR2 (128) | NOT NULL | Name of the object where the identifier action occurred                                                                                                                                                                                                                                                                                                                                              |
| OBJECT_TYPE      | VARCHAR2 (13)  |          | Type of the object where the identifier action occurred                                                                                                                                                                                                                                                                                                                                              |

| USAGE_ID         | NUMBER         |          | Unique key for the identifier usage within the object                                                                                                                                                                                                                                                                                                                                                |
| LINE             | NUMBER         |          | Line number of the identifier action                                                                                                                                                                                                                                                                                                                                                                 |
| COL              | NUMBER         |          | Column number of the identifier action                                                                                                                                                                                                                                                                                                                                                               |
| USAGE_CONTEXT_ID | NUMBER         |          | Context USAGE_ID of the identifier usage                                                                                                                                                                                                                                                                                                                                                             |
| CHARACTER_SET    | VARCHAR2 (10)  |          | Contains the value of the <code>character set</code> clause when it is used in a variable identifier declaration. These are the possible values when the character set is derived from another variable identifier: <ul style="list-style-type: none"> <li>• CHAR_CS</li> <li>• NCHAR_CS</li> <li>• IDENTIFIER</li> </ul>                                                                            |
| ATTRIBUTE        | VARCHAR2 (7)   |          | Column contains the attribute value when <code>%attribute</code> is used in a variable declaration. Possible values: <ul style="list-style-type: none"> <li>• ROWTYPE</li> <li>• TYPE</li> <li>• CHARSET</li> </ul>                                                                                                                                                                                  |
| CHAR_USED        | VARCHAR2 (4)   |          | Contains the type of the length constraint when it is used in a string length constraint declaration. Possible values: <ul style="list-style-type: none"> <li>• CHAR</li> <li>• BYTE</li> </ul>                                                                                                                                                                                                      |
| LENGTH           | NUMBER         |          | Contains the numeric length constraint value for a string length constraint declaration                                                                                                                                                                                                                                                                                                              |
| PRECISION        | NUMBER         |          | Contains the numeric precision when it is used in a variable declaration                                                                                                                                                                                                                                                                                                                             |
| PRECISION2       | NUMBER         |          | Contains the numeric second precision value (for instance, interval types) used in a variable declaration                                                                                                                                                                                                                                                                                            |

| Column               | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCALE                | NUMBER         |          | Contains the numeric scale value used in a variable declaration.                                                                                                                                                                                                                                                                                                                      |
| LOWER_RANGE          | NUMBER         |          | Contains the numeric lower range value used by a variable declaration with a range constraint                                                                                                                                                                                                                                                                                         |
| UPPER_RANGE          | NUMBER         |          | Contains the numeric upper range value used by a variable declaration with a range constraint                                                                                                                                                                                                                                                                                         |
| NULL_CONSTRAINT      | VARCHAR2 (8)   |          | This column is set when a <b>NULL</b> constraint is used by a variable declaration. Possible values: <ul style="list-style-type: none"> <li>• <b>NULL</b></li> <li>• <b>NOT NULL</b></li> </ul>                                                                                                                                                                                       |
| SQL_BUILTIN          | VARCHAR2 (3)   |          | Is set to <b>YES</b> when an identifier is a SQL builtin used in a SQL statement issued from PL/SQL. Otherwise, this column is set to <b>NO</b> .                                                                                                                                                                                                                                     |
| IMPLICIT             | VARCHAR2 (3)   |          | Indicates whether the identifier is an implicit identifier that does not appear in the source ( <b>YES</b> ) or not ( <b>NO</b> )                                                                                                                                                                                                                                                     |
| DECLARED_OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the object in which this identifier was declared                                                                                                                                                                                                                                                                                                                             |
| DECLARED_OBJECT_NAME | VARCHAR2 (128) | NOT NULL | Name of the object in which this identifier was declared                                                                                                                                                                                                                                                                                                                              |
| DECLARED_OBJECT_TYPE | VARCHAR2 (12)  |          | Type of the object in which this identifier was declared                                                                                                                                                                                                                                                                                                                              |
| ORIGIN_CON_ID        | VARCHAR2 (256) |          | The ID of the container where the data originates. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows in non-CDBs. This value is not used for CDBs.</li> <li>• <i>n</i>: This value is used for rows containing data that originate in the container with container ID <i>n</i> (<i>n</i> = 1 if the row originates in root)</li> </ul> |

## 3.236 ALL\_IMMUTABLE\_ROW\_VERSION\_HISTORY

ALL\_IMMUTABLE\_ROW\_VERSION\_HISTORY provides a history of row versions in the immutable tables accessible to the current user.

This view is populated for an immutable table with a row version only when rows are purged from that immutable table. For each different value of the PDB\_GUID and KEYCOL<sub>n</sub>\_VALUE columns, information about only the youngest purged row is kept in the view.

### Related Views

- DBA\_IMMUTABLE\_ROW\_VERSION\_HISTORY provides a history of row versions in all immutable tables in the database.
- USER\_IMMUTABLE\_ROW\_VERSION\_HISTORY provides a history of row versions in the immutable tables owned by the current user. This view does not display the SCHEMA\_NAME column.

| Column           | Datatype       | NULL     | Description                           |
|------------------|----------------|----------|---------------------------------------|
| SCHEMA_NAME      | VARCHAR2 (128) | NOT NULL | Schema containing the immutable table |
| TABLE_NAME       | VARCHAR2 (128) | NOT NULL | Name of the immutable table           |
| ROW_VERSION_NAME | VARCHAR2 (128) | NOT NULL | Name of the row version               |

## 3.241 ALL\_IND\_COLUMNS

ALL\_IND\_COLUMNS describes the columns of indexes on all tables accessible to the current user.

### Related Views

- [DBA\\_IND\\_COLUMNS](#) describes the columns of indexes on all tables in the database.
- [USER\\_IND\\_COLUMNS](#) describes the columns of indexes owned by the current user and columns of indexes on tables owned by the current user. This view does not display the INDEX\_OWNER or TABLE\_OWNER columns.

**Note:**

For join indexes, the TABLE\_NAME and TABLE\_OWNER columns in this view may not match the TABLE\_NAME and TABLE\_OWNER columns you find in the \*\_INDEXES (and other similar) data dictionary views.

| Column          | Datatype        | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|-----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INDEX_OWNER     | VARCHAR2 (128)  | NOT NULL | Owner of the index                                                                                                                                                                                                                                                                                                                                                         |

## 3.242 ALL\_IND\_EXPRESSIONS

`ALL_IND_EXPRESSIONS` describes the expressions of function-based indexes on tables accessible to the current user.

**Related Views**

- `DBA_IND_EXPRESSIONS` describes the expressions of all function-based indexes in the database.
- `USER_IND_EXPRESSIONS` describes the expressions of function-based indexes on tables owned by the current user. This view does not display the `INDEX_OWNER` or `TABLE_OWNER` columns.

| Column            | Datatype       | NULL     | Description                                          |
|-------------------|----------------|----------|------------------------------------------------------|
| INDEX_OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the index                                   |
| INDEX_NAME        | VARCHAR2 (128) | NOT NULL | Name of the index                                    |
| TABLE_OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the table or cluster                        |
| TABLE_NAME        | VARCHAR2 (128) | NOT NULL | Name of the table or cluster                         |
| COLUMN_EXPRESSION | LONG           |          | Function-based index expression defining the column  |
| COLUMN_POSITION   | NUMBER         | NOT NULL | Position of the column or attribute within the index |

## 3.243 ALL\_IND\_PARTITIONS

ALL\_IND\_PARTITIONS displays, for each index partition accessible to the current user, the partition-level partitioning information, the storage parameters for the partition, and various partition statistics generated by the DBMS\_STATS package.

### Related Views

- DBA\_IND\_PARTITIONS describes all index partitions in the database.
- USER\_IND\_PARTITIONS describes the index partitions owned by the current user. This view does not display the INDEX\_OWNER column.

| Column             | Datatype       | NULL | Description                                                                                                                                                                                                                                                   |
|--------------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 3.244 ALL\_IND\_PENDING\_STATS

ALL\_IND\_PENDING\_STATS describes the pending statistics for tables, partitions, and subpartitions accessible to the current user collected using the DBMS\_STATS package.

### Related Views

- DBA\_IND\_PENDING\_STATS describes pending statistics for all tables, partitions, and subpartitions in the database.
- USER\_IND\_PENDING\_STATS describes pending statistics for tables, partitions, and subpartitions owned by the current user. This view does not display the OWNER column.

| Column                  | Datatype       | NULL | Description                           |
|-------------------------|----------------|------|---------------------------------------|
| OWNER                   | VARCHAR2 (128) |      | Name of the index owner               |

## 3.246 ALL\_IND\_SUBPARTITIONS

`ALL_IND_SUBPARTITIONS` displays, for each index subpartition accessible to the current user, the subpartition-level partitioning information, the storage parameters for the subpartition, and various subpartition statistics generated by the `DBMS_STATS` package.

### Related Views

- `DBA_IND_SUBPARTITIONS` describes all index subpartitions in the database.
- `USER_IND_SUBPARTITIONS` describes the index subpartitions owned by the current user. This view does not display the `INDEX_OWNER` column.

| Column                | Datatype       | NULL     | Description                                                                                              |

| BLEVEL                  | NUMBER        |          | B-Tree level (depth of the index from its root block to its leaf blocks). A depth of 0 indicates that the root block and leaf block are the same.                                                                                                                                                                                                                                                                                                                                                                                             |
| LEAF_BLOCKS             | NUMBER        |          | Number of leaf blocks in the index                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| DISTINCT_KEYS           | NUMBER        |          | Number of distinct keys in the index partition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| AVG_LEAF_BLOCKS_PER_KEY | NUMBER        |          | Average number of leaf blocks in which each distinct value in the index appears, rounded to the nearest integer. For indexes that enforce <b>UNIQUE</b> and <b>PRIMARY KEY</b> constraints, this value is always 1.                                                                                                                                                                                                                                                                                                                           |
| AVG_DATA_BLOCKS_PER_KEY | NUMBER        |          | Average number of data blocks in the table that are pointed to by a distinct value in the index rounded to the nearest integer. This statistic is the average number of data blocks that contain rows that contain a given value for the indexed columns.                                                                                                                                                                                                                                                                                     |
| CLUSTERING_FACTOR       | NUMBER        |          | Indicates the amount of order of the rows in the table based on the values of the index. <ul style="list-style-type: none"> <li>• If the value is near the number of blocks, then the table is very well ordered. In this case, the index entries in a single leaf block tend to point to rows in the same data blocks.</li> <li>• If the value is near the number of rows, then the table is very randomly ordered. In this case, it is unlikely that index entries in the same leaf block point to rows in the same data blocks.</li> </ul> |
| NUM_ROWS                | NUMBER        |          | Number of rows in this index subpartition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Column           | Datatype        | NULL | Description                                                                                                                                                                                                                                      |
|------------------|-----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAMPLE_SIZE      | NUMBER          |      | Sample size used in analyzing this subpartition                                                                                                                                                                                                  |
| LAST_ANALYZED    | DATE            |      | Date on which this partition was most recently analyzed                                                                                                                                                                                          |
| BUFFER_POOL      | VARCHAR2 (7)    |      | Buffer pool for the subpartition: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• RECYCLE</li> <li>• NULL</li> </ul>                                                                                                 |
| FLASH_CACHE      | VARCHAR2 (7)    |      | Database Smart Flash Cache hint to be used for subpartition blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> Solaris and Oracle Linux functionality only.                                     |
| CELL_FLASH_CACHE | VARCHAR2 (7)    |      | Cell flash cache hint to be used for subpartition blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> <b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |
| USER_STATS       | VARCHAR2 (3)    |      | Indicates whether statistics were entered directly by the user (YES) or not (NO)                                                                                                                                                                 |
| GLOBAL_STATS     | VARCHAR2 (3)    |      | GLOBAL_STATS will be YES if statistics have been gathered or NO if statistics have not been gathered                                                                                                                                             |
| INTERVAL         | VARCHAR2 (3)    |      | Indicates whether the partition is in the interval section of an interval partitioned table (YES) or whether the partition is in the range section (NO)                                                                                          |
| SEGMENT_CREATED  | VARCHAR2 (3)    |      | Indicates whether the index subpartition segment has been created (YES) or not (NO); N/A indicates that this index is not subpartitioned                                                                                                         |
| DOMIDX_OPSTATUS  | VARCHAR2 (6)    |      | Status of the operation on the domain index: <ul style="list-style-type: none"> <li>• NULL - Index is not a domain index</li> <li>• VALID - Operation performed without errors</li> <li>• FAILED - Operation failed with an error</li> </ul>     |
| PARAMETERS       | VARCHAR2 (1000) |      | For a domain index, the parameter string                                                                                                                                                                                                         |
| HIGH_VALUE_CLOB  | CLOB            |      | High value (boundary) information for the index subpartition, in CLOB format                                                                                                                                                                     |
| HIGH_VALUE_JSON  | JSON            |      | High value (boundary) information for the index subpartition, in JSON format                                                                                                                                                                     |

# 3.247 ALL\_INDEXES

ALL\_INDEXES describes the indexes on the tables accessible to the current user.

To gather statistics for this view and the related views DBA\_INDEXES and USER\_INDEXES, use the DBMS\_STATS package.

**Related Views**

- DBA\_INDEXES describes all indexes in the database.
- USER\_INDEXES describes the indexes owned by the current user. This view does not display the OWNER column.

**Note:**

Column names followed by an asterisk are populated only if you collect statistics on the index using the DBMS\_STATS package.

| Column      | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                |
|-------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the index                                                                                                                                                                                                                                                                                                         |
| INDEX_NAME  | VARCHAR2 (128) | NOT NULL | Name of the index                                                                                                                                                                                                                                                                                                          |
| INDEX_TYPE  | VARCHAR2 (27)  |          | Type of the index: <ul style="list-style-type: none"><li>• LOB</li><li>• NORMAL</li><li>• NORMAL/REV</li><li>• BITMAP</li><li>• FUNCTION-BASED NORMAL</li><li>• FUNCTION-BASED NORMAL/REV</li><li>• FUNCTION-BASED BITMAP</li><li>• FUNCTION-BASED DOMAIN</li><li>• CLUSTER</li><li>• IOT - TOP</li><li>• DOMAIN</li></ul> |
| TABLE_OWNER | VARCHAR2 (128) | NOT NULL | Owner of the indexed object                                                                                                                                                                                                                                                                                                |
| TABLE_NAME  | VARCHAR2 (128) | NOT NULL | Name of the indexed object                                                                                                                                                                                                                                                                                                 |

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                                                            |
|-----------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLE_TYPE      | CHAR (11)     |      | Type of the indexed object: <ul style="list-style-type: none"> <li>• NEXT OBJECT</li> <li>• INDEX</li> <li>• TABLE</li> <li>• CLUSTER</li> <li>• VIEW</li> <li>• SYNONYM</li> <li>• SEQUENCE</li> </ul>                                                                                |
| UNIQUENESS      | VARCHAR2 (9)  |      | Indicates whether the index is unique (UNIQUE) or nonunique (NONUNIQUE)                                                                                                                                                                                                                |
| COMPRESSION     | VARCHAR2 (13) |      | Type of compression being used for the index: <ul style="list-style-type: none"> <li>• ENABLED - Prefix compression</li> <li>• ADVANCED HIGH - Advanced high compression</li> <li>• ADVANCED LOW - Advanced low compression</li> <li>• DISABLED - No compression is present</li> </ul> |
| PREFIX_LENGTH   | NUMBER        |      | Number of columns in the prefix of the compression key                                                                                                                                                                                                                                 |
| TABLESPACE_NAME | VARCHAR2 (30) |      | Name of the tablespace containing the index                                                                                                                                                                                                                                            |
| INI_TRANS       | NUMBER        |      | Initial number of transactions                                                                                                                                                                                                                                                         |
| MAX_TRANS       | NUMBER        |      | Maximum number of transactions                                                                                                                                                                                                                                                         |
| INITIAL_EXTENT  | NUMBER        |      | Size of the initial extent                                                                                                                                                                                                                                                             |
| NEXT_EXTENT     | NUMBER        |      | Size of secondary extents                                                                                                                                                                                                                                                              |
| MIN_EXTENTS     | NUMBER        |      | Minimum number of extents allowed in the segment                                                                                                                                                                                                                                       |
| MAX_EXTENTS     | NUMBER        |      | Maximum number of extents allowed in the segment                                                                                                                                                                                                                                       |
| PCT_INCREASE    | NUMBER        |      | Percentage increase in extent size                                                                                                                                                                                                                                                     |
| PCT_THRESHOLD   | NUMBER        |      | Threshold percentage of block space allowed per index entry                                                                                                                                                                                                                            |
| INCLUDE_COLUMN  | NUMBER        |      | Column ID of the last column to be included in index-organized table primary key (non-overflow) index. This column maps to the COLUMN_ID column of the *_TAB_COLUMNS view.                                                                                                             |
| FREELISTS       | NUMBER        |      | Number of process freelists allocated to this segment                                                                                                                                                                                                                                  |
| FREELIST_GROUPS | NUMBER        |      | Number of freelist groups allocated to this segment                                                                                                                                                                                                                                    |
| PCT_FREE        | NUMBER        |      | Minimum percentage of free space in a block                                                                                                                                                                                                                                            |
| LOGGING         | VARCHAR2 (3)  |      | Indicates whether or not changes to the index are logged: <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>                                                                                                                                                        |
| BLEVEL*         | NUMBER        |      | B*-Tree level (depth of the index from its root block to its leaf blocks). A depth of 0 indicates that the root block and leaf block are the same.                                                                                                                                     |
| LEAF_BLOCKS*    | NUMBER        |      | Number of leaf blocks in the index                                                                                                                                                                                                                                                     |
| DISTINCT_KEYS*  | NUMBER        |      | Number of distinct indexed values. For indexes that enforce UNIQUE and PRIMARY KEY constraints, this value is the same as the number of rows in the table (*_TABLES.NUM_ROWS)                                                                                                          |

| Column                   | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVG_LEAF_BLOCKS_PER_KEY* | NUMBER        |      | Average number of leaf blocks in which each distinct value in the index appears, rounded to the nearest integer. For indexes that enforce <code>UNIQUE</code> and <code>PRIMARY KEY</code> constraints, this value is always 1.                                                                                                                                                                                                                                                                                                                                                              |
| AVG_DATA_BLOCKS_PER_KEY* | NUMBER        |      | Average number of data blocks in the table that are pointed to by a distinct value in the index rounded to the nearest integer. This statistic is the average number of data blocks that contain rows that contain a given value for the indexed columns.                                                                                                                                                                                                                                                                                                                                    |
| CLUSTERING_FACTOR*       | NUMBER        |      | Indicates the amount of order of the rows in the table based on the values of the index. <ul style="list-style-type: none"> <li>If the value is near the number of blocks, then the table is very well ordered. In this case, the index entries in a single leaf block tend to point to rows in the same data blocks.</li> <li>If the value is near the number of rows, then the table is very randomly ordered. In this case, it is unlikely that index entries in the same leaf block point to rows in the same data blocks.</li> </ul> For bitmap indexes, this column is not applicable. |
| STATUS                   | VARCHAR2 (8)  |      | Indicates whether a nonpartitioned index is <code>VALID</code> or <code>UNUSABLE</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| NUM_ROWS                 | NUMBER        |      | Number of rows in the index.<br>For bitmap indexes, this column is the number of distinct keys, so its value is the same as the <code>DISTINCT_KEYS</code> column.                                                                                                                                                                                                                                                                                                                                                                                                                           |

| DEGREE                   | VARCHAR2 (40) |      | Number of threads per instance for scanning the index, or <code>DEFAULT</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| INSTANCES                | VARCHAR2 (40) |      | Number of instances across which the indexes to be scanned, or <code>DEFAULT</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PARTITIONED              | VARCHAR2 (3)  |      | Indicates whether the index is partitioned ( <code>YES</code> ) or not ( <code>NO</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TEMPORARY                | VARCHAR2 (1)  |      | Indicates whether the index is on a temporary table ( <code>Y</code> ) or not ( <code>N</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| GENERATED                | VARCHAR2 (1)  |      | Indicates whether the name of the index is system-generated ( <code>Y</code> ) or not ( <code>N</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SECONDARY                | VARCHAR2 (1)  |      | Indicates whether the index is a secondary object created by the <code>ODCIIndexCreate</code> method of the Oracle Data Cartridge ( <code>Y</code> ) or not ( <code>N</code> )                                                                                                                                                                                                                                                                                                                                                                                                               |
| BUFFER_POOL              | VARCHAR2 (7)  |      | Buffer pool to be used for index blocks: <ul style="list-style-type: none"> <li><code>DEFAULT</code></li> <li><code>KEEP</code></li> <li><code>RECYCLE</code></li> <li><code>NULL</code></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                          |

| Column                  | Datatype        | NULL | Description                                                                                                                                                                                                                                           |
|-------------------------|-----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FLASH_CACHE             | VARCHAR2 (7)    |      | Database Smart Flash Cache hint to be used for index blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> Solaris and Oracle Linux functionality only.                                                 |
| CELL_FLASH_CACHE        | VARCHAR2 (7)    |      | Cell flash cache hint to be used for index blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> <b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information             |
| USER_STATS              | VARCHAR2 (3)    |      | Indicates whether statistics were entered directly by the user (YES) or not (NO)                                                                                                                                                                      |
| DURATION                | VARCHAR2 (15)   |      | Indicates the duration of a temporary table: <ul style="list-style-type: none"> <li>• SYS\$SESSION - Rows are preserved for the duration of the session</li> <li>• SYS\$TRANSACTION - Rows are deleted after COMMIT</li> </ul> NULL - Permanent table |
| PCT_DIRECT_ACCESS       | NUMBER          |      | For a secondary index on an index-organized table, the percentage of rows with VALID guess                                                                                                                                                            |
| ITYP_OWNER              | VARCHAR2 (128)  |      | For a domain index, the owner of the indextype                                                                                                                                                                                                        |
| ITYP_NAME               | VARCHAR2 (128)  |      | For a domain index, the name of the indextype                                                                                                                                                                                                         |
| PARAMETERS              | VARCHAR2 (1000) |      | For a domain index, the parameter string                                                                                                                                                                                                              |
| GLOBAL_STATS            | VARCHAR2 (3)    |      | GLOBAL_STATS will be YES if statistics are gathered or incrementally maintained, otherwise it will be NO                                                                                                                                              |
| DOMIDX_STATUS           | VARCHAR2 (12)   |      | Status of a domain index: <ul style="list-style-type: none"> <li>• NULL - Index is not a domain index</li> <li>• VALID - Index is a valid domain index</li> <li>• IDXTYP_INVLD - Indextype of the domain index is invalid</li> </ul>                  |
| DOMIDX_OPSTATUS         | VARCHAR2 (6)    |      | Status of the operation on a domain index: <ul style="list-style-type: none"> <li>• NULL - Index is not a domain index</li> <li>• VALID - Operation performed without errors</li> <li>• FAILED - Operation failed with an error</li> </ul>            |
| FUNCIDX_STATUS          | VARCHAR2 (8)    |      | Status of a function-based index: <ul style="list-style-type: none"> <li>• NULL - Index is not a function-based index</li> <li>• ENABLED - Function-based index is enabled</li> <li>• DISABLED - Function-based index is disabled</li> </ul>          |
| JOIN_INDEX              | VARCHAR2 (3)    |      | Indicates whether the index is a join index (YES) or not (NO)                                                                                                                                                                                         |
| IOT_REDUNDANT_PKEY_ELIM | VARCHAR2 (3)    |      | Indicates whether redundant primary key columns are eliminated from secondary indexes on index-organized tables (YES) or not (NO)                                                                                                                     |

| Column            | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                              |
|-------------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DROPPED           | VARCHAR2 (3)  |      | Indicates whether the index has been dropped and is in the recycle bin (YES) or not (NO); NULL for partitioned tables<br>This view does not return the names of indexes that have been dropped.                                                                                                                                                          |
| VISIBILITY        | VARCHAR2 (9)  |      | Indicates whether the index is VISIBLE or INVISIBLE to the optimizer                                                                                                                                                                                                                                                                                     |
| DOMIDX_MANAGEMENT | VARCHAR2 (14) |      | If this is a domain index, indicates whether the domain index is system-managed (SYSTEM_MANAGED) or user-managed (USER_MANAGED)                                                                                                                                                                                                                          |
| SEGMENT_CREATED   | VARCHAR2 (3)  |      | Indicates whether the index segment has been created (YES) or not (NO)                                                                                                                                                                                                                                                                                   |
| ORPHANED_ENTRIES  | VARCHAR2 (3)  |      | Indicates whether a global index contains stale entries because of deferred index maintenance during DROP/TRUNCATE PARTITION, or MODIFY PARTITION INDEXING OFF operations.<br>Possible values: <ul style="list-style-type: none"> <li>• YES - The index contains orphaned entries</li> <li>• NO - The index does not contain orphaned entries</li> </ul> |
| INDEXING          | VARCHAR2 (7)  |      | Indicates whether a global index is decoupled from the underlying table.<br>Possible values: <ul style="list-style-type: none"> <li>• PARTIAL - The index is partial, that is, it will follow the table's indexing property.</li> <li>• FULL - The index will include all partitions of the table.</li> </ul>                                            |
| AUTO              | VARCHAR2 (3)  |      | Indicates whether the index is an auto index (YES) or not (NO)                                                                                                                                                                                                                                                                                           |
| CONSTRAINT_INDEX  | VARCHAR2 (3)  |      | Indicates whether the index was created as part of a constraint (YES) or not (NO)                                                                                                                                                                                                                                                                        |

## 3.248 ALL\_INDEXTYPE\_ARRAYTYPES

ALL\_INDEXTYPE\_ARRAYTYPES displays information about the array types specified by the indextypes accessible to the current user.

### Related Views

- DBA\_INDEXTYPE\_ARRAYTYPES displays information about the array types specified by all indextypes in the database.
- USER\_INDEXTYPE\_ARRAYTYPES displays information about the array types specified by the indextypes owned by the current user.

| Column            | Datatype       | NULL     | Description                   |
|-------------------|----------------|----------|-------------------------------|
| OWNER             | VARCHAR2 (128) | NOT NULL | Owner of the indextype        |
| INDEXTYPE_NAME    | VARCHAR2 (128) | NOT NULL | Name of the indextype         |
| BASE_TYPE_SCHEMA  | VARCHAR2 (128) |          | Name of the base type schema  |
| BASE_TYPE_NAME    | VARCHAR2 (128) |          | Name of the base type name    |
| BASE_TYPE         | VARCHAR2 (30)  |          | Datatype of the base type     |
| ARRAY_TYPE_SCHEMA | VARCHAR2 (128) | NOT NULL | Name of the array type schema |
| ARRAY_TYPE_NAME   | VARCHAR2 (128) | NOT NULL | Name of the array type name   |

## 3.252 ALL\_INTERNAL\_TRIGGERS

ALL\_INTERNAL\_TRIGGERS describes internal triggers on tables accessible to the current user. Internal triggers are internal pieces of code executed when a particular flag is set for a table. This view does not display the OWNER\_NAME column.

#### Related Views

- DBA\_INTERNAL\_TRIGGERS describes internal triggers on all tables in the database.
- USER\_INTERNAL\_TRIGGERS describes all internal triggers on tables owned by the current user. This view does not display the OWNER\_NAME column.

| Column                | Datatype       | NULL | Description                                         |
|-----------------------|----------------|------|-----------------------------------------------------|
| TABLE_NAME            | VARCHAR2 (128) |      | Name of the table on which the trigger is defined   |
| INTERNAL_TRIGGER_TYPE | VARCHAR2 (19)  |      | Indicates the type of internal trigger on the table |

#### See Also:

## 3.254 ALL\_JAVA\_CLASSES

ALL\_JAVA\_CLASSES displays class level information about the stored Java classes accessible to the current user.

### Related Views

- DBA\_JAVA\_CLASSES displays class level information about all stored Java classes in the database.

- **USER\_JAVA\_CLASSES** displays class level information about the stored Java classes owned by the current user. This view does not display the **OWNER** column.

| Column        | Datatype        | NULL     | Description                                                                                     |
|---------------|-----------------|----------|-------------------------------------------------------------------------------------------------|
| OWNER         | VARCHAR2 (128)  | NOT NULL | Owner of the Java class                                                                         |
| NAME          | VARCHAR2 (4000) |          | Name of the Java class                                                                          |
| MAJOR         | NUMBER          |          | Major version number of the Java class, as defined in the JVM specification                     |
| MINOR         | NUMBER          |          | Minor version number of the Java class, as defined in the JVM specification                     |
| KIND          | VARCHAR2 (50)   |          | Indicates whether the stored object is a Java class (CLASS) or a Java interface (INTERFACE)     |
| ACCESSIBILITY | VARCHAR2 (9)    |          | Accessibility of the Java class                                                                 |
| IS_INNER      | VARCHAR2 (3)    |          | Indicates whether this Java class is an inner class (YES) or not (NO)                           |
| IS_ABSTRACT   | VARCHAR2 (3)    |          | Indicates whether this Java class is an abstract class (YES) or not (NO)                        |
| IS_FINAL      | VARCHAR2 (3)    |          | Indicates whether this Java class is a final class (YES) or not (NO)                            |
| IS_STATIC     | VARCHAR2 (3)    |          | Indicates whether this is a static inner class (YES) or not (NO)                                |
| IS_STRICTFP   | VARCHAR2 (3)    |          | Indicates whether the class is declared strict floating point for portability (YES) or not (NO) |
| IS_SYNTHETIC  | VARCHAR2 (3)    |          | Indicates whether this is an inner class generated by the compiler (YES) or not (NO)            |
| IS_DEBUG      | VARCHAR2 (3)    |          | Indicates whether this Java class contains debug information (YES) or not (NO)                  |
| SOURCE        | VARCHAR2 (4000) |          | Source designation of the Java class                                                            |
| SUPER         | VARCHAR2 (4000) |          | Super class of this Java class                                                                  |
| OUTER         | VARCHAR2 (4000) |          | Outer class of this Java class if this Java class is an inner class                             |

## 3.259 ALL\_JAVA\_INNERS

`ALL_JAVA_INNERS` displays information about inner classes referred to by the stored Java classes accessible to the current user.

**Related Views**

- `DBA_JAVA_INNERS` displays information about inner classes referred to by all stored Java classes in the database.
- `USER_JAVA_INNERS` displays information about inner classes referred to by the stored Java classes owned by the current user. This view does not display the `OWNER` column.

| Column | Datatype       | NULL     | Description             |
|--------|----------------|----------|-------------------------|
| OWNER  | VARCHAR2 (128) | NOT NULL | Owner of the Java class |

| Column         | Datatype        | NULL | Description                                                                                                                                   |
|----------------|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| NAME           | VARCHAR2 (4000) |      | Name of the Java class                                                                                                                        |
| INNER_INDEX    | NUMBER          |      | Index of the referred inner class                                                                                                             |
| SIMPLE_NAME    | VARCHAR2 (4000) |      | Simple name of the referred inner class                                                                                                       |
| FULL_NAME      | VARCHAR2 (4000) |      | Full name of the referred inner class                                                                                                         |
| ACCESSIBILITY  | VARCHAR2 (9)    |      | Accessibility of the referred inner class: <ul style="list-style-type: none"> <li>• PUBLIC</li> <li>• PRIVATE</li> <li>• PROTECTED</li> </ul> |
| IS_STATIC      | VARCHAR2 (3)    |      | Indicates whether the referred inner class is declared static in the source file (YES) or not (NO)                                            |
| IS_FINAL       | VARCHAR2 (3)    |      | Indicates whether the referred inner class is declared final in the source file (YES) or not (NO)                                             |
| IS_ABSTRACT    | VARCHAR2 (3)    |      | Indicates whether the referred inner class is declared abstract in the source file (YES) or not (NO)                                          |
| IS_INTERFACE   | VARCHAR2 (3)    |      | Indicates whether the referred inner class is declared interface in the source file (YES) or not (NO)                                         |
| IS_STRICTFP    | VARCHAR2 (3)    |      | Indicates whether the inner class is declared strictfp (YES) or not (NO)                                                                      |
| IS_SYNTHETIC   | VARCHAR2 (3)    |      | Indicates whether the inner class is generated by the compiler (YES) or not (NO)                                                              |
| IS_ENUM        | VARCHAR2 (3)    |      | Indicates whether the inner class is an enum (YES) or not (NO)                                                                                |
| IS_ANNOTATION  | VARCHAR2 (3)    |      | Indicates whether the inner class is an annotation (YES) or not (NO)                                                                          |
| KIND           | VARCHAR2 (50)   |      | Type (class, interface, enum or annotation) of the inner class                                                                                |
| ALL_QUALIFIERS | VARCHAR2 (101)  |      | Concatenation of accessibility, type and other attributes of the inner class                                                                  |

## 3.264 ALL\_JAVA\_THROWS

`ALL_JAVA_THROWS` displays information about exceptions thrown from methods of the Java classes accessible to the current user.

### Related Views

- `DBA_JAVA_THROWS` displays information about exceptions thrown from methods of all Java classes in the database.
- `USER_JAVA_THROWS` displays information about exceptions thrown from methods of the Java classes owned by the current user. This view does not display the `OWNER` column.

| Column          | Datatype        | NULL     | Description                                   |
|-----------------|-----------------|----------|-----------------------------------------------|
| OWNER           | VARCHAR2 (128)  | NOT NULL | Owner of the Java class                       |
| NAME            | VARCHAR2 (4000) |          | Name of the Java class                        |
| METHOD_INDEX    | NUMBER          |          | Index of the throwing method of the exception |
| METHOD_NAME     | VARCHAR2 (4000) |          | Name of the throwing method of the exception  |
| EXCEPTION_INDEX | NUMBER          |          | Index of the exception                        |
| EXCEPTION_CLASS | VARCHAR2 (4000) |          | Class of the exception                        |

## 3.265 ALL\_JOBS

ALL\_JOBS is a synonym for USER\_JOBS.

### See Also:

"USER\_JOBS"

## 3.266 ALL\_JOIN\_IND\_COLUMNS

ALL\_JOIN\_IND\_COLUMNS describes the join conditions of bitmap join indexes accessible to the current user. Bitmap join indexes are indexes built on a child table with an index key containing columns from associated parent tables, where all of the tables are connected through join conditions. There is one row for each join condition.

### Related Views

- DBA\_JOIN\_IND\_COLUMNS describes all join conditions in the database.
- USER\_JOIN\_IND\_COLUMNS describes the join conditions owned by the current user. This view does not display the INDEX\_OWNER column.

| Column             | Datatype       | NULL     | Description                             |
|--------------------|----------------|----------|-----------------------------------------|
| INDEX_OWNER        | VARCHAR2 (128) | NOT NULL | Owner of the bitmap join index          |
| INDEX_NAME         | VARCHAR2 (128) | NOT NULL | Name of the bitmap join index           |
| INNER_TABLE_OWNER  | VARCHAR2 (128) | NOT NULL | Owner of the fact table                 |
| INNER_TABLE_NAME   | VARCHAR2 (128) | NOT NULL | Name of the fact table                  |
| INNER_TABLE_COLUMN | VARCHAR2 (128) | NOT NULL | Name of the fact table join column      |
| OUTER_TABLE_OWNER  | VARCHAR2 (128) | NOT NULL | Owner of the dimension table            |
| OUTER_TABLE_NAME   | VARCHAR2 (128) | NOT NULL | Name of the dimension table             |
| OUTER_TABLE_COLUMN | VARCHAR2 (128) | NOT NULL | Name of the dimension table join column |

## 3.267 ALL\_JSON\_COLLECTION\_TABLES

ALL\_JSON\_COLLECTION\_TABLES describes JSON collection tables accessible to the current user.

### Related Views

- `DBA_JSON_COLLECTION_TABLES` describes all JSON collection tables in the database.
- `USER_JSON_COLLECTION_TABLES` describes JSON collection tables owned by the current user.

| Column          | Datatype       | NULL     | Description                                                                                    |
|-----------------|----------------|----------|------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128) | NOT NULL | Name of the JSON collection table owner                                                        |
| COLLECTION_NAME | VARCHAR2 (128) | NOT NULL | Name of the JSON collection table                                                              |
| WITH_ETAG       | VARCHAR2 (3)   |          | Indicates whether the JSON collection table was created with the ETAG option (YES) or not (NO) |

#### Note:

This view is available starting with Oracle Database 23ai.

## 3.268 ALL\_JSON\_COLLECTION\_VIEWS

`ALL_JSON_COLLECTION_VIEWS` describes JSON collection views accessible to the current user.

### Related Views

- `DBA_JSON_COLLECTION_VIEWS` describes all JSON collection views in the database.
- `USER_JSON_COLLECTION_VIEWS` describes JSON collection views owned by the current user.

| Column          | Datatype       | NULL     | Description                            |
|-----------------|----------------|----------|----------------------------------------|
| OWNER           | VARCHAR2 (128) | NOT NULL | Name of the JSON collection view owner |
| COLLECTION_NAME | VARCHAR2 (128) | NOT NULL | Name of the JSON collection view       |

#### Note:

This view is available starting with Oracle Database 23ai, Release Update 23.6.

## 3.269 ALL\_JSON\_COLLECTIONS

ALL\_JSON\_COLLECTIONS describes JSON collections accessible to the current user.

**Related Views**

- DBA\_JSON\_COLLECTIONS describes all JSON collections in the database.
- USER\_JSON\_COLLECTIONS describes JSON collections owned by the current user.

| Column          | Datatype       | NULL | Description                                                                                                                |
|-----------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128) |      | Name of the JSON collection owner                                                                                          |
| COLLECTION_NAME | VARCHAR2 (128) |      | Name of the JSON collection                                                                                                |
| COLLECTION_TYPE | VARCHAR2 (12)  |      | Type of the JSON collection: <ul style="list-style-type: none"><li>• TABLE</li><li>• VIEW</li><li>• DUALITY VIEW</li></ul> |

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

- ["USER\\_JSON\\_COLLECTIONS"](#)

## 3.270 ALL\_JSON\_COLUMNS

ALL\_JSON\_COLUMNS provides information on the JavaScript Object Notation (JSON) columns accessible to the current user.

This view displays information on table and view columns that are guaranteed to return JSON data. These include:

- Columns of data type `JSON`

- Columns on which a check constraint containing the `IS JSON` condition is defined, where the `IS JSON` condition is always enforced. Such check constraints can contain only the `IS JSON` condition, or they can contain the `IS JSON` condition as part of a logical `AND` condition.

For example, the following check constraints ensure that the `IS JSON` condition is always enforced and will therefore cause `mycol` to appear in the `ALL_JSON_COLUMNS` view:

```
mycol IS JSON
mycol IS JSON AND LENGTH(mycol) > 100
```

However, the following check constraint does not ensure that the `IS JSON` condition is enforced, because it is part of a logical `OR` condition, and will therefore cause `mycol` to be omitted from the `ALL_JSON_COLUMNS` view:

```
mycol IS JSON OR LENGTH(mycol) > 100
```

- View columns that are defined as the return value of a SQL function that returns JSON data. Such functions include:
  - `TREAT ( expr AS JSON )`
  - `JSON_ARRAY`, `JSON_ARRAYAGG`, `JSON_MERGEPATCH`, `JSON_OBJECT`, `JSON_OBJECTAGG`, `JSON_QUERY`, `JSON_SERIALIZE`, and `JSON_TRANSFORM`

For example, in the following definition for view `v1`, column `mycol` is defined as the return value of the `JSON_OBJECT` function, which will therefore cause `mycol` to appear in the `ALL_JSON_COLUMNS` view:

```
CREATE TABLE t1 (text varchar2(100));
CREATE VIEW v1 AS SELECT JSON_OBJECT(text) AS mycol FROM t1;
```

### Related Views

- `DBA_JSON_COLUMNS` provides information on all JSON columns.
- `USER_JSON_COLUMNS` provides information on the JSON columns for which the user is the owner. This view does not display the `OWNER` column.

| Column      | Datatype       | NULL | Description                                                                     |
|-------------|----------------|------|---------------------------------------------------------------------------------|
| OWNER       | VARCHAR2 (128) |      | Owner of the table with the JSON column                                         |
| TABLE_NAME  | VARCHAR2 (128) |      | Name of the table with the JSON column                                          |
| OBJECT_TYPE | VARCHAR2 (5)   |      | Object type: <ul style="list-style-type: none"><li>TABLE</li><li>VIEW</li></ul> |
| COLUMN_NAME | VARCHAR2 (128) |      | Name of the JSON column                                                         |
| FORMAT      | VARCHAR2 (9)   |      | Format of the JSON data                                                         |
| DATA_TYPE   | VARCHAR2 (13)  |      | Data type of the JSON column                                                    |

## 3.271 ALL\_JSON\_DATAGUIDE\_FIELDS

ALL\_JSON\_DATAGUIDE\_FIELDS extracts the path and type information from the data guides accessible to the current user, which are the data guides returned to the user by the ALL\_JSON\_DATAGUIDE view.

### Related Views

- DBA\_JSON\_DATAGUIDE\_FIELDS extracts the path and type information from all the data guides in the database, which are the data guides returned by the DBA\_JSON\_DATAGUIDE view.
- USER\_JSON\_DATAGUIDE\_FIELDS extracts the path and type information from all the data guides in the current user's schema, which are the data guides returned to the user by the USER\_JSON\_DATAGUIDE view. This view does not display the OWNER column.

| Column      | Datatype        | NULL | Description                                         |
|-------------|-----------------|------|-----------------------------------------------------|
| OWNER       | VARCHAR2 (128)  |      | Owner of the table containing the JSON column       |
| TABLE_NAME  | VARCHAR2 (128)  |      | Name of the table containing the JSON column        |
| COLUMN_NAME | VARCHAR2 (128)  |      | Name of the JSON column that has data guide enabled |
| PATH        | VARCHAR2 (4000) |      | Path to the JSON field in the data guide            |
| TYPE        | VARCHAR2 (40)   |      | Type of the JSON field in the data guide            |
